SPECIAL EDUCATION AND REHABILITATION

WEDNESDAY, OCTOBER 28, 1959

House of Representatives. SUBCOMMITTEE ON SPECIAL EDUCATION OF THE COMMITTEE ON EDUCATION AND LABOR,

New York, N.Y.

The subcommittee met at 10 a.m. pursuant to call, at the 71st Regiment Armory, Park Avenue and 34th Street, Hon. Carl Elliott (chairman of the subcommittee) presiding.

Present: Representatives Barden, Elliott, Daniels, Giaimo, and

Lafore.

Also present: Representative John V. Lindsay.

Staff member present: Mary P. Allen, clerk, Subcommittee on Special Education.

Mr. Elliott. The Subcommittee on Special Education of the House

Committee on Education and Labor will come to order.

My name is Carl Elliott, and I represent the Seventh Congressional District of Alabama.

On my right is Congressman Dominick V. Daniels, a Member of Congress from the State of New Jersey, and on his right is Robert N.

Giaimo, a Member of Congress from Connecticut.

On our committee, also, is Congressman John Lafore of Pennsylvania, who will be here shortly; Congressman Wainwright of New York, who has been unavoidably delayed, but who will arrive later today. We will be honored to have present sometime during the course of our hearings the chairman of our full committee, the Committee on Education and Labor, the Honorable Graham A. Barden of North Carolina.

Congressman Zelenko of the 21st District of New York is also a member of this committee, and will be present to sit with the subcom-

mittee during some of the time that we are here.

Congressman John Lindsay will sit with the subcommittee today. These hearings are being held in his congressional district, the 17th District of New York, and we are happy to welcome Mr. Lindsay to participate in our hearings.

The purpose of these hearings, as most of you know, is to receive testimony on the urgent needs, national and local, in the fields of special education and rehabilitation and to get specific suggestions as to how the Federal Government might aid in solving some of these problems.

The subcommittee also has pending before it several bills concerning the field of rehabilitation and special education, and we will be glad to receive comments on these specific measures: H.R. 3465, by myself; H.R. 1119, by Congressman Fogarty; House Joint Resolution 494, and House Joint Resolution 488. These bills will be made a part

of the record immediately following the present statement that I am

making.

The hearings are scheduled for today, tomorrow, and Friday, if necessary. I presume it will be necessary that the hearings go over to the 30th, because I note from my list that we have a schedule of 31 witnesses for today. In order to hear 31 witnesses, it is necessary that we proceed right along with about 10 minutes to each witness.

Witnesses will be allowed to file their writen statements in full. would like to suggest to each witness that he be prepared to summarize in about 6 minutes his statement, and that he then file his full statement for the record. The remaining 4 minutes of the witness will be used for questioning. There will be 6 minutes for the summary, 4 minutes for the questioning, and then file the full written statement for the record. In that manner we will be able to proceed right along. (The bills and joint resolutions referred to follow:)

[H.R. 3465, 86th Cong., 1st sess.]

A BILL To provide evaluation of rehabilitation potentials and rehabilitation services to handicapped individuals who as a result thereof can achieve such ability of independent living as to dispense with the need for expensive institutional care or who can dispense with or largely dispense with the need of an attendant at home; to assist in the establishment of public and private nonprofit workshops and rehabilitation facilities; and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "Rehabilitation Act of 1959."

FINDING OF FACT AND DECLARATION

The Congress hereby finds and declares—

(1) that many severely handicapped persons, including the mentally ill or retarded, and older persons, ineligible for vocational rehabilitation, as a result of independent living rehabilitation services can achieve such a degree of independence that-

(a) their institutional care can be terminated, or

(b) their need for an attendant's care at home will be ended or

substantially reduced, and

(c) in many instances these individuals will be found to be capable of vocational rehabilitation and will become gainfully employed taxpayers;

(2) that the provision of independent living rehabilitation services to such severely handicapped persons ends or minimizes the public and family burden of providing them with attendant's care, contributes greatly to their

dignity and self-respect, and is in the public interest;

(3) that there is a grave shortage of rehabilitation facilities where in-dependent living and vocational rehabilitation services are provided the severely handicapped, including hearing and speech correction, fitting and use of prosthetic devices, adjustment, prevocational and vocational training, and particularly of centers providing a variety of such services

(4) that there is a grave shortage of sheltered workshop facilities wherein work capacities of severely handicapped can be evaluated and developed, and can also be utilized in productive work in cases where the handicapped indi-

vidual is not absorbable in the competitive labor market; and

(5) that Federal grants assisting in the provision of the foregoing rehabilitation facilities and services are required in the public interest as a necessary expansion of present grants under the Vocational Rehabilitation

Act.

Sec. 2. (a) The Vocational Rehabilitation Act, as amended by the Vocational Rehabilitation Amendments of 1954 (29 U.S.C., ch. 4), is amended (a) by inserting at the beginning thereof the heading "TITLE 1", (b) by striking out the phrase "this Act" wherever it appears, and inserting in lieu thereof "this title", by inserting before the period at the end of section 11(a) the following: "Provided. That vocational rehabilitation services shall not include any evaluation services with respect to which grants have been qualified for by the State and have been, or will be paid, under title IV of this Act" and (c) by adding the

following after section 3(e):

"(d) In the event of failure of any State or States to qualify in a fiscal year for any payment under this section or to qualify for a payment in an amount less than the amount of the State's allotment, the amount equal to the total of each such State's allotment, or the difference between its allotment and its payment, as the case may be, shall be reallotted among the remaining States on the basis of their respective population."

SEC. 3. The Vocational Rehabilitation Act, as amended by the Vocational Rehabilitation Amendments of 1954, is further amended by adding at the end

thereof three new titles as follows:

"TITLE II—INDEPENDENT LIVING REHABILITATION SERVICES

"AUTHORIZATION OF APPROPRIATIONS FOR GRANTS, PURPOSE FOR WHICH AVAILABLE

"Sec. 201. For the purpose of assisting the States in rehabilitating handicapped individuals who, as a result of such rehabilitation, may be expected to achieve such ability of independent living as to dispense with, or largely dispense with, the need for institutional care or, if not institutionalized, to dispense with, or largely dispense with, the need for an attendant, thereby reducing their burden upon others and contributing to their dignity and self-respect, there is hereby authorized for the fiscal year ending June 30, 1960, \$10,000,000; for the fiscal year ending June 30, 1961, \$20,000,000; and for each fiscal year thereafter such sums as Congress may determine necessary to carry out the purposes of this title.

"GRANTS FOR INDEPENDENT LIVING REHABILITATION SERVICES

"Sec. 202. (a) From the sums made available under section 201 to assist States in meeting the costs of independent living rehabilitation services, each State shall be entitled to an allotment of an amount which bears the same ratio to such sums as the product of the population of the State and the square of its allotment percentage (as defined in section 11(h) of title I) bears to the sum of the corresponding products for all the States. The allotment to any State under an allotment for any year which is less than \$25,000, or in the case of the Virgin Islands is less than \$10,000 (or such other amount as may be specified in a minimum allotment in the Act appropriating such sums for such year), shall be increased to that amount, the total of the increases thereby required being derived by proportionately reducing the allotments to each of the remaining States, but with such adjustments as may be necessary to prevent the allotments of any such remaining States from being thereby reduced below that amount. In the event of failure of any State or States to qualify in a fiscal year for any payment under this section or to qualify for a payment in an amount less than the amount of the State's allotment, the amount equal to the total of each such State's allotment, or the difference between its allotment and its payment, as the case may be, shall be reallotted among the remaining States.

"(b) From each State's allotment under this section, as determined by the Secretary of Health, Education, and Welfare (hereinafter called the Secretary), the Secretary shall pay to such State an amount equal to the Federal share (determined as provided in section 11(1) of title I of this Act) of the cost, including cost of administration, of independent living rehabilitation services provided under the independent living rehabilitation plan approved under section 203 of this title, which such plan is incorporated in the State plan approved

under section 5 of title I of this Act.

"STATE INDEPENDENT LIVING REHABILITATION PLANS

"Sec. 203. (a) To be approved under this title, a State plan for independent

living rehabilitation services shall-

"(1) designate the State agency administering or supervising the administration of vocational education in the State, or a State rehabilitation agency (primarily concerned with vocational rehabilitation), as the sole State agency to administer the plan, or to supervise its administration to the extent that any part thereof is administered in local areas by any public agency pursuant to contract, except that where under the State's law the State blind commission, or other agency which provides assistance or services to the adult blind, is authorized to provide them vocational rehabilitation

services, such State blind commission or other State agency may be designated as the sole State agency to administer the part of the plan under which vocational rehabilitation services are provided for the blind (or to supervise the administration of such part in a political subdivision of the State by a sole local agency of such political subdivision) and the State vocational education agency or the State rehabilitation agency shall be designated as the sole State agency with respect to the rest of the State plan:

"(2) provide for financial participation of the State, which may include non-State funds which the State plan specifies may be accepted by the

"(3) provide such methods of administration, other than methods relating to the establishment and maintenance of personnel standards, as are found by the Secretary to be necessary for the proper and efficient administration

"(4) contain (A) provisions relating to the establishment and maintenance of personnel standards, including provisions relating to the tenure, selection, appointment, and qualification of personnel, and (B) provisions relating to the establishment and maintenance of minimum standards governing the facilities and personnel utilized in the provision of independent living rehabilitation services, but the Secretary shall exercise no authority with respect to the selection, method of selection, tenure of office, or compensation of any individual employed in accordance with such provisions;

"(5) show the plan, policies, and methods to be followed in carrying out the work under the State plan and in its administration and supervision and, in case independent living rehabilitation services cannot be provided all eligible physically handicapped individuals who apply for such services, show the order to be followed in selecting those to whom independent living

rehabilitation services will be provided;

"(6) provide that the State agency will make such reports, in such form and containing such information, as the Secretary may from time to time reasonably require to carry out his functions under this Act, and comply with such provisions as he may from time to time find necessary to assure

the correctness and verification of such reports;

"(7) provide for cooperation by the State agency with, and the utilization of the services of, the State agencies administering the State's public assistance and public health programs, and the Bureau of Old-Age and Survivors Insurance (Department of Health, Education, and Welfare) and of other Federal, State, and local public agencies providing services relating to independent living rehabilitation services.

"(b) The Secretary shall approve any plan which he finds fulfills the conditions specified in subsection (a) of this section which is submitted as an addition to a State plan for vocational rehabilitation approved by the Secretary under

title I of this Act.

"(c) Whenever the Secretary, after reasonable notice and opportunity for hearing to the State agency administering or supervising the administration of the State plan approved under this section, finds that-"(1) the plan has been so changed that it no longer complies with the

requirements of subsection (a) of this section; or

(2) in the administration of the plan there is a failure to comply substantially with any such provision;

the Secretary shall notify such State agency that no further payments will be made to the State under this title until he is satisfied that there is no longer any such failure. Until he is so satisfied, the Secretary shall make no further payment to such State under this title.

"(d) If any State is dissatisfied with the Secretary's action under subsection (c) of this section, such State may appeal to the United States district court for the district where the capital of such State is located, and judicial review of such action shall be had on the record in accordance with the provisions of the Administrative Procedure Act.

"METHOD OF COMPUTING AND MAKING PAYMENTS

"Sec. 204. The method of computing and paying amounts pursuant to this title shall be as follows:

"(a) The Secretary shall, prior to the beginning of each calendar quarter or other period prescribed by him, estimate the amount to be paid to each State

under the provisions of this title for such period, such estimate to be based on such records of the State and information furnished by it, and such other investi-

gation as the Secretary may find necessary.

"(b) The Secretary shall pay, from the allotment available therefor, the amount so estimated by him for such period, reduced or increased, as the case may be, by any sum (not previously adjusted under this paragraph) by which he finds that his estimate of the amount to be paid the State for any prior period under this title was greater or less than the amount which should have been paid to the State for such prior period under this title. Such payments shall be made prior to audit or settlement by the General Accounting Office, shall be made through the disbursing facilities of the Treasury Department, and shall be made in such installments as the Secretary may determine.

"ADMINISTRATION

"Sec. 205. (a) In carrying out his duties under this Act, the Secretary shall-"(1) make studies, investigations, demonstrations, and reports with respect to programs of independent living rehabilitation services carried on under

"(2) cooperate with and render technical assistance to States in matters relating to the independent living rehabilitation of physically and mentally

handicapped individuals:

"(3) provide training and instruction in technical matters relating to independent living rehabilitation services, including the establishment and maintenance of such research fellowships and traineeships, with such stipends and allowances (including travel and subsistence expenses), as he

may deem necessary;
"(4) disseminate information as to the studies, investigations, demonstrations, and reports referred to in paragraph (1) and other matters relat-

ing to independent living rehabilitation services.

"(b) The Secretary is authorized to make rules and regulations governing the administration of this Act, and to delegate to any officer or employee of the United States such of his powers and duties, except the making of rules and regulations, as he finds necessary in carrying out the purposes of this Act.

"DEFINITIONS

"Sec. 206. For the purpose of this title-

"(a) The term 'independent living rehabilitation services' means counseling, psychological and related services (including transportation) rendered seriously handicapped individuals and in the case of any such individual found to require financial assistance with respect thereto, after full consideration of his eligibility for any similar benefits by way of pension, compensation, and insurance, such term shall include physical restoration and related services, including corrective surgery, therapeutic treatment, and hospitalization, needed prosthetic appliances and other devices which will contribute to independent living and training in the use thereof, and maintenance needed to assure the availability of such services.

"(b) The term 'handicapped individual' means an individual of employable age, as defined by regulations of the Secretary, who is under such physical or mental disability as to require institutional care or attendance in his household continuously or for a substantial portion of the time, but who can be reasonably expected, as a result of rehabilitation services to achieve such ability of independent living that he will no longer require such institutional care or such

attendance in his household.

"(c) The term 'State' includes Alaska, District of Columbia, Hawaii, Virgin Islands, Puerto Rico, and Guam.

"TITLE III—WORKSHOPS AND REHABILITATION FACILITIES

"AUTHORIZATION OF APPROPRIATIONS FOR GRANTS; PURPOSES FOR WHICH AVAILABLE

"Sec. 301. (a) For the purpose of encouraging and assisting in the establishment of public and other nonprofit workshops and rehabilitation facilities needed in rehabilitating physically and mentally handicapped individuals, there is hereby authorized to be appropriated for the fiscal year ending June 30, 1960, the sum of \$10,000,000; for the fiscal year ending June 30, 1961, \$12,500,000; for the fiscal year ending June 30, 1962, \$15,000,000 and for each fiscal year thereafter such sums as Congress may determine, for grants to carry out the purpose of this title, including any amounts which may be specifically appropriated for area

facilities.

"(b) In making grants hereunder, except from funds specifically appropriated for and limited to area facilities, the Secretary of Health, Education, and Welfare, hereinafter called the Secretary, shall, insofar as practical and consistent with the purposes of this Act, distribute grants for projects in the several States in aggregate amounts proportionate to their respective populations, and in no event shall grants hereunder to a State exceed by more than 50 per centum the aggregate amount it would receive on such population basis or \$10,000, whichever is greater: Provided, That in any case where the Secretary of Health, Education, and Welfare finds that any State or States has no project, or insufficient projects, to utilize fully the amount it would utilize in a fiscal year, he may, after January 1 of such year redistribute the funds which would otherwise have been paid such State to other States for suitable projects and such distribution need not be proportionate to State populations.

"(c) As used in this section 'area facilities' means facilities intended to serve

areas which include all or parts of two or more States.

"GRANTS FOR ESTABLISHMENT OF WORKSHOPS AND REHABILITATION FACILITIES

"Sec. 302. (a) From the sums made available pursuant to section 301 of this title, the Secretary shall make grants for paying part of the costs incurred in the establishment of nonprofit workshops and rehabilitation facilities as hereafter defined and limited in subsections (b) and (c) hereof, and subject to the conditions and requirements of section 303 of this title. Such grants shall be available for payment of administrative expenses found by the Secretary to be necessary in connection with performance by the State of its functions under this title.

"(b) Nonprofit workshops and rehabilitation facilities with respect to which grants may be made pursuant to subsection (a) hereof, shall include but not

be limited to-

"(1) nonprofit workshops where any manufacture or handiwork is carried on, and which are operated for the primary purpose of providing one or

more of the following:

"(A) remunerate employment to severely handicapped individuals as an interim step in the rehabilitation process for those who cannot readily be absorbed in the competitive labor market, or during such time as employment opportunities for them in the competitive labor market do not exist:

"(B) an opportunity for evaluating the work potential and develop-

ing the work capacity of handicapped individuals; or

- "(C) employment for handicapped individuals confined to their homes.

 "(2) nonprofit rehabilitation facilities operated for the primary purpose of assisting in the rehabilitation of physically and mentally handicapped individuals—
 - "(A) which provide one or more of the following types of services:

 "(i) testing, fitting, or training in the use of prosthetic devices;

"(ii) vocational training;

"(iii) prevocational or conditioning therapy;

"(iv) physical, occupational, or other medically supervised therapy;

"(v) adjustment training; or

"(vi) evaluation or control of special disabilities; or

"(B) through which is provided an integrated program of medical, psychological, social, and vocational evaluation and services under competent professional supervision: *Provided*, That the major portion of such evaluation and services is furnished within the facility and that all medical and related health services are prescribed by, or are under the formal supervision of, persons licensed to practice medicine or surgery in the State.

"(b) Grants shall be made with respect to construction or alternation of buildings and procurement or installation of initial equipment necessary to establish or increase their effectiveness as workshops or rehabilitation facilities, and staffing for a period not to exceed two years. Grants shall be subject to such limitations and conditions as the Secretary of Health, Education, and Wel-

fare shall prescribe to assure minimum standards for facilities and personnel under this Act, including a system of priorities for the approval of projects.

"(c) The Federal share of cost of the workshop or rehabilitation facility established under this title shall not exceed two dollars for each one dollar which is otherwise obtained and used toward defraying such cost.

"(d) No grant shall be made under this title with respect to any workshop or

rehabilitation facility unless-

- "(1) application therefor in such form and containing such data and assurances as are required by the Secretary has been transmitted through and approved as feasible and necessary for vocational rehabilitation by the State agency designated pursuant to section 5(a)(1) of title I of the State where such workshop or other rehabilitation facility is located or to be located;
- "(2) the Secretary finds that the facility with respect to which such grant is requested is feasible, is needed, and that Federal grants for its establishment are not available under any other Federal law;

"(3) the Secretary finds that wages paid handicapped workers meet wage and hour standards administered by the United States Department of Labor;

"(4) the Secretary requires, and the applicant provides, such assurances, in such form and with such provisions as the Secretary finds necessary to insure that the purpose of such grant will be carried out and that its conditions and limitations of such grant will be complied with.

"TITLE IV-REHABILITATION EVALUATION SERVICES

"AUTHORIZATION FOR APPROPRIATIONS

"Sec. 401. For the purpose of assisting the States in evaluating the nature and extent of the disabilities and the rehabilitation potentials of individuals of employable age, as defined in regulations of the Secretary of Health, Education, and Welfare, whose application therefor shows that they are under a substantial physical or mental handicap which may be overcome or substantially reduced by vocational rehabilitation services available under title I of this Act or otherwise available, or whose dependency may be overcome or substantially reduced by independent living rehabilitation services available under title I hereof, or otherwise available, there is hereby authorized to be appropriated for the fiscal year ending June 30, 1959, and for each fiscal year thereafter, such sums as are necessary for grants to States to carry out the purpose of this title.

"PAYMENTS TO STATES

"Sec. 402. (a) From the sums appropriated therefor, the Secretary of the Treasury shall pay to each State which has an approved plan for vocational rehabilitation (under title I of this Act) and for independent living rehabilitation services (under title II of this Act), for each fiscal year an amount equal to two-thirds of the total of the sums expended by the State agency or agencies administering such plans during such year, including administrative costs thereof, as found necessary by the Secretary of Health, Education, and Welfare, for the proper and efficient evaluation of disabilities and rehabilitation poten-

tials referred to in section 401.

"(b) The Secretary of Health, Education, and Welfare shall, prior to the beginning of each quarter, or such other period as he shall prescribe as appropriate, estimate the amount to be paid with respect to expenditures for such evaluations in such period, such estimate to be based on (1) a report filed by such State agency or agencies containing the estimates of such expenditures, and stating the amount appropriated or made available by the State and its political subdivisions for such expenditures in such period, and if such amount is less than the State's proportionate sum of such estimated expenditures, the sources from which the difference is expected to be derived, (2) records of the number of applicants for rehabilitation evaluation, and (3) such other records and reports as the Secretary may find necessary.

"(c) The Secretary of Health, Education, and Welfare shall then certify to the Secretary of the Treasury the amount so estimated by the Secretary of Health, Education, and Welfare, (A) reduced or increased, as the case may be, by any sum by which the Secretary of Health, Education, and Welfare finds that his estimate for any prior period was greater or less than the amount which should have been paid to the State under subsection (a) for such period;

except that such increases or reductions shall not be made to the extent that such sums have been applied to make the amount certified for any prior period greater or less than the amount estimated by the Secretary of Health, Education, and Welfare for such prior period.

"The Secretary of the Treasury shall thereupon, through the fiscal service of the Treasury Department and prior to audit or settlement by the General Accounting Office, pay to the State, at the time or times fixed by the Secretary of Health, Education, and Welfare, the amount so certified.

"(d) Payments hereunder shall not be made to a State with respect to any period for which the Secretary refuses payment of grants to such State under title I or II hereof pursuant to the provisions of such titles.

"DEFINITION OF REHABILITATION EVALUATION SERVICES

"Sec. 403. The term 'rehabilitation evaluation services' means (1) diagnostic and related services (including transportation) incidental to the determination of the nature and extent of an individual's physical and mental impairment and rehabilitation potentials and the rehabilitation services required to realize these potentials, (2) the determination of appropriate referral of such individual for vocational rehabiliation services as defined in title I of this Act, independent living rehabilitation services as defined in title II of this Act, or other needed services provided by public or private agencies. In the case of individuals found to require financial assistance with respect thereto such term also includes maintenance during any period he is required to be away from home during the period diagnostic and other evaluation services are being provided."

RESEARCH AND DEMONSTRATION PROJECTS

SEC. 5. The part of the first sentence of section 4(a) of the Vocational Rehabilitation Act as amended by the Vocational Rehabilitation Amendments of 1954 (Public Law 565, Eighty-third Congress, 29 U.S.C., ch. 4) which reads: "(1) For paying part of" is amended to read "(1) For paying or sharing in".

PRESIDENT'S COMMITTEE ON THE EMPLOYMENT OF THE PHYSICALLY HANDICAPPED

Sec. 6. The joint resolution entitled "Joint resolution authorizing an appropriation for the work of the President's Committee on National Employment of the Physically Handicapped Week", approved July 11, 1949 (63 Stat. 409), as amended, is amended by striking out "\$225,000" and inserting in lieu thereof "\$300,000."

[H.R. 1119, 86th Cong., 1st sess.]

A BILL To provide evaluation of rehabilitation potentials and rehabilitation services to handicapped individuals who as a result thereof can achieve such ability of independent living as to dispense with the need for expensive institutional care or who can dispense with or largely dispense with the need of an attendant at home; to assist in the establishment of public and private nonprofit workshops and rehabilitation facilities; and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "Rehabilitation Act of 1959".

FINDINGS OF FACT AND DECLARATION

The Congress hereby finds and declares-

(1) that many severely handicapped persons, including the mentally ill or retarded, and older persons, ineligible for vocational rehabilitation, as a result of independent living rehabilitation services can achieve such a degree of independence that-

(a) their institutional care can be terminated, or

(b) their need for an attendant's care at home will be ended or substantially reduced, and

(c) in many instances these individuals will be found to be capable of vocational rehabilitation and will become gainfully employed taxpayers;

(2) that the provision of independent living rehabilitation services to such severely handicapped persons ends or minimizes the public and family burden of providing them with attendant's care, contributes greatly to their dignity and self-respect, and is in the public interest;

(3) that there is a grave shortage of rehabilitation facilities where independent living and vocational rehabilitation services are provided the severely handicapped, including hearing and speech correction, fitting and use of prosthetic devices, adjustment, prevocational and vocational training, and particularly of centers providing a variety of such service;

(4) that there is a grave shortage of sheltered workshop facilities whereinwork capacities of severely handicapped can be evaluated and developed, and can also be utilized in productive work in cases where the handicapped

individual is not absorbable in the competitive labor market; and

(5) that Federal grants assisting in the provision of the foregoing rehabilitation facilities and services are required in the public interest as a necessary expansion of present grants under the Vocational Rehabilitation Act.

SEC. 2. (a) The Vocational Rehabilitation Act, as amended by the Vocational Rehabilitation Amendments of 1954 (29 U.S.C. ch. 4), is amended (a) by inserting at the beginning thereof the hearing "TITLE I", (b) striking out the phrase "this Act" wherever it appears, and inserting in lieu thereof "this title", by inserting before the period at the end of section 11(a) the following: "Provided, That vocational rehabilitation services shall not include any evaluation service with respect to wrich grants have been qualified for by the State and have been or will be paid under title IV of this Act", and (c) by adding the following after section 3(c):

"(d) In the event of failure of any State or States to qualify in a fiscal year for any payment under this section or to qualify for a payment in an amount less than the amount of the State's allotment, the amount equal to the total of each such State's alloment, or the difference between its allotment and its payment, as the case may be, shall be reallocated among the remaining States on the basis

of their respective population."

SEC. 3. The Vocational Rehabilitation Act, as amended by the Vocational Rehabilitation Amendments of 1954, is further amended by adding at the end thereof three new titles as follows.

"TITLE II-INDEPENDENT LIVING REHABILITATION SERVICES

"AUTHORIZATION OF APPROPRIATIONS FOR GRANTS, PURPOSE FOR WHICH AVAILABLE

"Sec. 201. For the purpose of assisting the States in rehabilitating handicapped individuals who, as a result of such rehabilitation, may be expected to achieve such ability of independent living as to dispense with, or largely dispense with, the need for institutional care or, if not institutionalized, to dispense with, or largely dispense with, the need for an attendant, thereby reducing their burden upon others and contributing to their dignity and self-respect, there is hereby authorized for the fiscal year ending June 30, 1958, \$10,000,000; for the fiscal year ending June 30, 1959, \$20,000,000; and for each fiscal year thereafter such sums as Congress may determine necessary to carry out of the purposes of this title.

"GRANTS FOR INDEPENDENT LIVING REHABILITATION SERVICES

"Sec. 202. (a) From the sums made available under section 201 to assist States in meeting the costs of independent living rehabilitation services, each State shall be entitled to an allotment of an amount which bears the same ratio to such sums as the product of the population of the State and the square of its allotment percentage (as defined in section 11(h) of title I) bears to the sum of the corresponding products for all the States. The allotment to any State under an allotment for any year which is less than \$25,000, or in the case of the Virgin Islands is less than \$10,000 (or such other amount as may be specified in a minimum allotment in the Act appropriating such sums for such year), shall be increased to that amount, the total of the increases thereby required being derived by proportionately reducing the allotments to each of the remaining States, but with such adjustments as may be necessary to prevent the allotments of any such remaining States from being thereby reduced below that amount. In the event of failure of any State or States to qualify in a fiscal year for any payment under this section or to qualify for a payment in an amount less than the amount of the State's allotment, the amount equal to the total of each such State's allotment, or the difference between its allotment and its payment, as the case may be, shall be reallotted among the remaining States.

"(b) From each State's allotment under this section, as determined by the Secretary of Health, Education, and Welfare (hereinafter called the Secretary), the Secretary shall pay to such State an amount equal to the Federal share (determined as provided in section 11(1) of title I of this Act) of the cost, including cost of administration, of independent living rehabilitation services provided under the independent living rehabilitation plan approved under section 203 of this title, which such plan is incorporated in the State plan approved under section 5 of title I of this Act.

"STATE INDEPENDENT LIVING REHABILITATION PLANS

"Sec. 203. (a) To be approved under this title, a State plan for independent liv-

ing rehabilitation services shall-

"(1) designate the State agency administering or supervising the administration of vocational education in the State, or a State rehabilitation agency (primarily concerned with vocational rehabilitation) as the sole State agency to administer the plan, or to supervise its administration to the extent that any part thereof is administered in local areas by any public agency pursuant to contract, except that where under the State's law the State blind commission, or other agency which provides assistance or services to the adult blind, is authorized to provide them vocational rehabilitation services, such State blind commission or other State agency may be designated as the sole State agency to administer the part of the plan under which vocational rehabilitation services are provided for the blind (or to supervise the administration of such part in a political subdivision of the State by a sole local agency of such political subdivision) and the State vocational education agency or the State rehabilitation agency shall be designated as the sole State agency with respect to the rest of the State plan;

"(2) provide for financial participation of the State, which may include non-State funds which the State plan specifies may be accepted by the State

agency:

"(3) provide such methods of administration, other than methods relating to the establishment and maintenance of personnel standards, as are found by the Secretary to be necessary for the proper and efficient adminis-

tration of the plan;

"(4) contain (A) provisions relating to the establishment and maintenance of personnel standards, including provisions relating to the tenure, selection, appointment, and qualification of personnel, and (B) provisions relating to the establishment and maintenance of minimum standards governing the facilities and personnel utilized in the provision of independent living rehabilitation services, but the Secretary shall exercise no authority with respect to the selection, method of selection, tenure of office, or compensation of any individual employed in accordance with such provisions;

"(5) show the plan, policies, and methods to be followed in carrying out the work under the State plan and in its administration and supervision and, in case independent living rehabilitation services cannot be provided all eligible physically handicapped individuals who apply for such services, show the order to be followed in selecting those to whom independ-

ent living rehabilitation services will be provided;
"(6) provide that the State agency will make such reports, in such form and containing such information, as the Secretary may from time to time reasonably require to carry out his functions under this Act, and comply with such provisions as he may from time to time find necessary to assure

the correctness and verification of such reports;

"(7) provide for cooperation by the State agency with, and the utilization of the services of, the State agencies administering the State's public assistance and public health programs, and the Bureau of Old-Age and Survivors Insurance (Department of Health, Education, and Welfare) and of other Federal, State, and local public agencies providing services relating to independent living rehabilitation services.

"(b) The Secretary shall approve any plan which he finds fulfills the conditions specified in subsection (a) of this section which is submitted as an addition to a State plan for vocational rehabilitation approved by the Secretary under

title I of this Act.

"(c) Whenever the Secretary, after reasonable notice and opportunity for hearing to the State agency administering or supervising the administration of the State plan approved under this section, finds that"(1) the plan has been so changed that it no longer complies with the requirements of subsection (a) of this section; or

"(2) in the administration of the plan there is a failure to comply sub-

stantially with any such provision;

the Secretary shall notify such State agency that no further payments will be made to the State under this title until he is satisfied that there is no longer any such failure. Until he is so satisfied, the Secretary shall make no further payment to such State under this title.

"(d) If any State is dissatisfied with the Secretary's action under subsection (c) of this section, such State may appeal to the United States district court for the district where the capital of such State is located, and judicial review of such action shall be had on the record in accordance with the provisions of the Administrative Procedure Act.

"METHOD OF COMPUTING AND MAKING PAYMENTS

"Sec. 204. The method of computing and paying amounts pursuant to this title shall be as follows:

"(a) The Secretary shall, prior to the beginning of each calendar quarter or other period prescribed by him, estimate the amount to be paid to each State under the provisions of this title for such period, such estimate to be based on such records of the State and information furnished by it, and such other inves-

tigation as the Secretary may find necessary.

"(b) The Secretary shall pay, from the allotment available therefor, the amount so estimated by him for such period, reduced or increased, as the case may be, by any sum (not previously adjusted under this paragraph) by which he finds that his estimate of the amount to be paid the State for any prior period under this title was greater or less than the amount which should have been paid to the State for such prior period under this title. Such payments shall be made prior to audit or settlement by the General Accounting Office, shall be made through the disbursing facilities of the Treasury Department, and shall be made in such installments as the Secretary may determine.

"ADMINISTRATION

"Sec. 205. (a) In carrying out his duties under this Act, the Secretary shall—"(1) make studies, investigations, demonstrations, and reports with respect to programs of independent living rehabilitation services carried on under this title:

"(2) cooperate with and render technical assistance to States in matters relating to the independent living rehabilitation of physically and mentally

handicapped individuals;

"(3) provide training and instruction in technical matters relating to independent living rehabilitation services, including the establishment and maintenance of such research fellowships and traineeships, with such stipends and allowances (including travel and subsistence expenses), as he may deem necessary:

"(4) disseminate information as to the studies, investigations, demonstrations, and reports referred to in paragraph (1) and other matters relat-

ing to independent living rehabilitation services.

"(b) The Secretary is authorized to make rules and regulations governing the administration of this Act, and to delegate to any officer or employee of the United States such of his powers and duties, except the making of rules and regulations as he finds necessary in carrying out the purposes of this Act.

"DEFINITIONS

"Sec. 206. For the purpose of this title-

"(a) The term 'independent living rehabilitation services' means counseling, psychological and related services (including transportation) rendered seriously handicapped individuals and in the case of any such individual found to require financial assistance with respect thereto, after full consideration of his eligibility for any similar benefits by way of pension, compensation, and insurance, such term shall include physical restoration and related services, including corrective surgery, therapeutic treatment, and hospitalization, needed prosthetic appliances and other devices which will contribute to independent living and training in the use thereof, and maintenance needed to assure the availability of such services.

"(b) The term 'handicapped individual' means an individual of employable age, as defined by regulations of the Secretary, who is under such physical or mental disability as to require institutional care or attendance in his household continuously or for a substantial portion of the time, but who can be reasonably expected, as a result of rehabilitation services to achieve such ability of independent living that he will no longer require such institutional care or such attendance in his household.

"(c) The term 'State' includes the District of Columbia, Hawaii, Virgin Is-

lands, Puerto Rico, and Guam.

"TITLE III—WORKSHOPS AND REHABILITATION FACILITIES

"AUTHORIZATION OF APPROPRIATIONS FOR GRANTS; PURPOSES FOR WHICH AVAILABLE

"Sec. 301. (a) For the purpose of encouraging and assisting in the establishment of public and other nonprofit workshops and rehabilitation facilities needed in rehabilitating physically and mentally handicapped individuals, there is hereby authorized to be appropriated for the fiscal year ending June 30, 1959, the sum of \$10,000,000; for the fiscal year ending June 30, 1960, \$12,500,000; for the fiscal year ending June 30, 1960, \$12,500,000; for the fiscal year ending June 30, 1960, \$12,500,000; for the fiscal year ending June 30, 1961, \$15,000,000 and for each fiscal year thereafter such sums as Congress may determine for grants to carry out the purpose of this title, including any amounts which may be specifically appropriated for area facilities.

"(b) In making grants hereunder, except from funds specifically appropriated for and limited to area facilities, the Secretary of Health, Education, and Welfare, hereinafter called the Secretary, shall, insofar as practical and consistent with the purposes of this Act, distribute grants for projects in the several States in aggregate amounts proportionate to their respective populations, and in no event shall grants hereunder to a State exceed by more than 50 per centum the aggregate amount it would receive on such population basis or \$10,000, whichever is greater: Provided, That in any case where the Secretary of Health, Education, and Welfare finds that any State or States has no project, or insufficient projects, to utilize fully the amount it would utilize in a fiscal year, he may, after January 1 of such year redistribute the funds which would otherwise have been paid such State to other States for suitable projects and such distribution need not be proportionate to State populations.

"(c) As used in this section 'area facilities' means facilities intended to serve

areas which include all or parts of two or more States.

"GRANTS FOR ESTABLISHMENT OF WORKSHOPS AND REHABILITATION FACILITIES

SEC. 302. (a) From the sums made available pursuant to section 301 of this title, the Secretary shall make grants for paying part of the costs incurred in the establishment of nonprofit workshops and rehabilitation facilities as hereafter defined and limited in subsections (b) and (c) hereof, and subject to the conditions and requirements of section 303 of this title. Such grants shall be available for payment of administrative expenses found by the Secretary to be necessary in connection with performance by the State of its functions under this title.

"(b) Nonprofit workshops and rehabilitation facilities with respect to which grants may be made pursuant to subsection (a) hereof, shall include but not

be limited to-

"(1) nonprofit workshops where any manufacture or handiwork is carried on, and which are operated for the primary purpose of providing one

or more of the following:

"(A) remunerative employment to severely handicapped individuals as an interim step in the rehabilitation process for those who cannot readily be absorbed in the competitive labor market, or during such time as employment opportunities for them in the competitive labor market do not exist;

"(B) an opportunity for evaluating the work potential and develop-

ing the work capacity of handicapped individuals; or

"(C) employment for handicapped individuals confined to their homes.

"(2) nonprofit rehabilitation facilities operated for the primary purpose of assisting in the rehabilitation of physically and mentally handicappped individuals-

"(A) which provide one or more of the following types of services: "(i) testing, fitting, or training in the use of prosthetic de-

"(ii) vocational training;

"(iii) prevocational or conditioning therapy; "(iv) physical, occupational, or other medically supervised therapy;

"(v) adjustment training; or

"(iv) evaluation or control of special disabilities; or

"(B) through which is provided an integrated program of medical, psychological, social, and vocational evaluation and services under competent professional supervision: *Provided*, That the major portion of such evaluation and services is furnished within the facility and that all medical and related health services are prescribed by, or are under the formal supervision of, persons licensed to practice medi-

cine or surgery in the State.

"(b) Grants shall be made with respect to construction or alteration of buildings and procurement or installation of initial equipment necessary to establish or increase their effectiveness as workshops or rehabilitation facilities, and staffing for a period not to exceed two years. Grants shall be subject to such limitations and conditions as the Secretary of Health, Education, and Welfare shall prescribe to assure minimum standards for facilities and personnel under this Act, including a system of priorities for the approval of projects.

"(c) The Federal share of cost of the workshop or rehabilitation facility established under this title shall not exceed two dollars for each one dollar

which is otherwise obtained and used toward defraying such cost.

"(d) No grant shall be made under this title with respect to any workshop

or rehabilitation facility unless-

"(1) application therefor in such form and containing such data and assurances as are required by the Secretary has been transmitted through and approved as feasible and necessary for vocational rehabilitation by the State agency designated pursuant to section 5(a)(1) of title I of the State where such workshop or other rehabilitation facility is located or to be located;

"(2) the Secretary finds that the facility with respect to which such grant is requested is feasible, is needed, and that Federal grants for its establish-

ment are not available under any other Federal law;

"(3) the Secretary finds that wages paid handicapped workers meet wage and hour standards administered by the United States Department of

Labor;

"(4) the Secretary requires, and the applicant provides, such assurances, in such form and with such provisions as the Secretary finds necessary to insure that the purpose of such grant will be carried out and that its conditions and limitations of such grant will be compiled with.

"TITLE IV—REHABILITATION EVALUATION SERVICES

"AUTHORIZATION FOR APPROPRIATIONS

"Sec. 401. For the purpose of assisting the States in evaluating the nature and extent of the disabilities and the rehabilitation potentials of individuals of employable age, as defined in regulations of the Secretary of Health, Education, and Welfare, whose application therefor shows that they are under a substantial physical or mental handicap which may be overcome or substantially reduced by vocational rehabilitation services available under title I of this Act of otherwise available, or whose dependency may be overcome or substantially reduced by independent living rehabilitation services available under title II hereof, or otherwise available, there is hereby authorized to be appropriated for the fiscal year ending June 30, 1959, and for each fiscal year thereafter, such sums as are necessary for grants to States to carry out the purpose of this title.

"PAYMENTS TO STATES

"Sec. 402. (a) From the sums appropriated therefor, the Secretary of the Treasury shall pay to each State which has an approved plan for vocational rehabilition (under title I of this Act) and for independent living rehabilitation services (under title II of this Act), for each fiscal year an amount equal to two-thirds of the total of the sums expended by the State agency or agencies administering such plans during such year, including administrative costs thereof, as found necessary by the Secretary of Health, Education, and Welfare, for the proper and efficient evaluation of disabilities and rehabilitation potentials referred to in section 401.

"(b) The Secretary of Health, Education, and Welfare shall, prior to the beginning of each quarter, or such other period as he shall prescribe as appropriate, estimate the amount to be paid with respect to expenditures for such evaluations in such period, such estimate to be based on (1) a report filed by such State agency or agencies containing the estimates of such expenditures, and stating the amount appropriated or made available by the State and its political subdivisions for such expenditures in such period, and if such amount is less than the State's proportionate sum of such estimated expenditures, the sources from which the difference is expected to be derived, (2) records of the number of applicants for rehabilitation evaluation, and (3) such other records and reports as

the Secretary may find necessary.

"(c) The Secretary of Health, Education, and Welfare shall then certify to the Secretary of the Treasury the amount so estimated by the Secretary of Health, Education, and Welfare, (A) reduced or increased, as the case may be, by any sum by which the Secretary of Health, Education, and Welfare finds that his estimate for any prior period was greater or less than the amount which should have been paid to the State under subsection (a) for such period; except that such increases or reductions shall not be made to the extent that such sums have been applied to make the amount certified for any prior period greater or less than the amount estimated by the Secretary of Health, Education, and Welfare for such prior period.

"The Secretary of the Treasury shall thereupon, through the fiscal service of the Treasury Department and prior to audit or settlement by the General Accounting Office, pay to the State, at the time or times fixed by the Secretary of

Health, Education, and Welfare, the amount so certified.

"(d) Payments hereunder shall not be made to a State with respect to any period for which the Secretary refuses payment of grants to such State under title I or II hereof pursuant to the provisions of such titles.

"DEFINITION OF REHABILITATION EVALUATION SERVICES

"Sec. 403. The term 'rehabilitation evaluation services' means (1) diagnostic and related services (including transportation) incidental to the determination of the nature and extent of an individual's physical and mental impairment and rehabilitation potentials and the rehabilitation services required to realize these potentials, (2) the determination of appropriate referral of such individual for vocational rehabilitation services as defined in title I of this Act, independent living rehabilitation services as defined in title II of this Act, or other needed services provided by public or private agencies. In the case of individuals found to require financial assistance with respect thereto such term also includes maintenance during any period he is required to be away from home during the period diagnostic and other evaluation services are being provided."

RESEARCH AND DEMONSTRATION PROJECTS

Sec. 5. The part of the first sentence of section 4 (a) of the Vocational Rehabilitation Act as amended by the Vocational Rehabilitation Amendments of 1954 (Public Law 565, 83d Congress, 29 U.S.C., ch. 4) which reads: "(1) For paying part of" is amended to read "(1) For paying or sharing in".

PRESIDENT'S COMMITTEE ON THE EMPLOYMENT OF THE PHYSICALLY HANDICAPPED

SEC. 6. The joint resolution entitled "Joint resolution authorizing an appropriation for the work of the President's Committee on National Employment of the Physically Handicapped Week", approved July 11, 1949 (63 Stat. 409), as amended, is amended by striking out "\$225,000" and inserting in lieu thereof "\$300,000."

[H.J. Res. 494, 86th Cong., 1st sess.]

JOINT RESOLUTION To help make available to those children in our country who are handicapped by deafness the specially trained teachers of the deaf needed to develop their abilities and to help make available to individuals suffering speech and hearing impairments those specially trained speech pathologists and audiologists needed to help them overcome their handicaps.

Whereas to meet the educational needs of some thirty thousand deaf children of school age in the United States requires the training of some five hundred teachers of the deaf annually; and

Whereas fewer than one hundred and fifty such teachers are in training this academic year; and

Whereas at least six of the institutions accredited for the training of teachers of the deaf have no trainees enrolled for the current academic year; and

Whereas while the number of deaf children enrolled in special schools or classes increased by four hundred a year over the previous ten years the increase in 1959 was more than twelve hundred; and

Whereas teachers of the deaf are needed in all States and the institutions currently accredited for the training of teachers of the deaf have the facilities for meeting the needs of all the States for such teachers; and

Whereas each State cannot and should not undertake a wasteful duplication

of facilities and faculties; and

Whereas some eight million Americans of all ages suffer from speech or hearing impairments of such nature as to seriously handicap them in their efforts to become self-supporting, self-sufficient taxpaying members of their communities; and

Whereas the medical, social, emotional, educational, and rehabilitation problems of this large section of our population result from speech and hearing defects a majority of which are remediable; and

Whereas some twenty thousand speech pathologists and audiologists are needed to properly diagnose, train, and rehabilitate these eight million handicapped people; and

Whereas to meet this need there are at present in the United States only some two thousand certified speech pathologists and audiologists and some five thousand noncertified specialists in this field; and

Whereas in order to begin to cope with the problems resulting from the critical shortage of trained personnel in this field it is estimated that our universities should be graduating at least one thousand five hundred properly trained

speech pathologists and audiologists each year; and Whereas only four hundred specially trained speech pathologists and audi-

ologists are being graduated each year; and

Whereas speech pathologists and audiologists are needed in all States to staff

schools, hospitals, and community service centers; and

Whereas each State cannot and should not undertake a wasteful duplication of facilities and faculties for the training of speech pathologists and audiologists: Now, therefore, be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled,

TITLE I-TRAINING OF TEACHERS OF THE DEAF

Sec. 101. In order to encourage and facilitate the training of teachers of the deaf, the Commissioner of Education (hereinafter in this title referred to as the "Commissioner") shall, in cooperation with the Advisory Committee on the Training of Teachers of the Deaf (established by section 105 and hereinafter in this title referred to as the "Advisory Committee"), establish and conduct a program of grants-in-aid to public and nonprofit institutions which are engaged in the training of teachers of the deaf and which are affiliated with recognized public or other nonprofit institutions of higher education to assist such institutions in providing such training. Such grants-in-aid shall be used by such institutions to assist in covering the cost of courses of training and study for teachers of the deaf and for establishing and maintaining scholarships for qualified persons who desire to enroll in such courses of training and study, the stipends of any such scholarships to be determined by the Commissioner. Commissioner shall submit all applications for grants-in-aid under this title to the Advisory Committee for its review and recommendations, and the Commissioner shall not approve any such application before he has received and studied the recommendations of the Advisory Committee with respect to such application, unless the Advisory Committee shall have failed to submit its

recommendations to him after having had adequate time to do so.

Sec. 102. Payments of grants-in-aid pursuant to this title shall be made by the Commissioner from time to time and on such conditions as he may determine, including the making of such reports as the Commissioner may determine to be necessary to carry out the provisions of this title. Such payments may be made either in advance or by way of reimbursement and shall be made only to institutions approved by the Commissioner for the training of teachers of the deaf.

SEC. 103. For the purposes of this title the term "nonprofit", as applied to an institution, means an institution owned and operated by one or more corporations or associations no part of the net earnings of which inures, or may lawfully inure, to the benefit of any private shareholder or individual.

SEC. 104. The Commissioner is authorized to delegate any of his functions under this title, except the making of regulations, to any officer or employee of the

Office of Education.

SEC. 105. (a) There is hereby established in the Office of Education an Advisory Committee on the Training of Teachers of the Deaf. The Advisory Committee shall consist of the Commissioner, who shall be Chairman, and twelve persons appointed, without regard to the civil service laws, by the Commissioner with the approval of the Secretary of the Department of Health, Education, and Welfare. Six of such appointed members shall be individuals identified with institutions engaged in the training of teachers of the deaf; three shall be individuals identified with institutions of higher education which are affiliated with institutions engaged n the training of teachers of the deaf; and three shall be individuals representative of the lay public who have demonstrated an interest in the education of the deaf.

(b) The appointed members of the Advisory Committee shall hold office for a term of four years, except that (1) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed shall be appointed for the remainder of such term, and (2) the terms of the members first taking office after the date of enactment of this title shall expire, as designated by the Commissioner at the time of appointment, three at the end of four years after such date, three at the end of two years after such date, and three at the end of one year after such date. None of the appointed member shall be eligible for reappointment until a year has elapsed since the end of his preceding term.

(c) The Advisory Committee shall periodically review the operations of the grants-in-aid program established pursuant to this title with a view to determining the extent to which such program is succeeding in carrying out the purposes for which it was established. On the basis of such reviews the Advisory Committee shall submit to the Commissioner such recommendations with respect to the operation and administration of the program as it may deem advisable, together with any recommendations for legislation which it may deem necessary or desirable to carry out the purposes for which this title was enacted. Such recommendations, together with the Commissioner's comments thereon, shall be referred to the Secretary of Health, Education, and Welfare for transmittal by him to the Congress.

(d) The Advisory Committee shall review all applications for grants-in-aid under this title and shall recommend to the Commissioner the approval of such applications as, in the opinion of the Advisory Committee, contribute to the carrying out of the purposes of this title, and the disapproval of such applications as, in the opinion of the Advisory Committee, do not contribute to the

carrying out of such purposes.

(e) The Commissioner may utilize the services of any member or members of the Advisory Committee in connection with matters relating to the provisions of this title, for such periods, in addition to conference periods, as he may determine.

(f) Members of the Advisory Committee shall, while serving on business of the Advisory Committee or at the request of the Commissioner under subsection (e) of this section, receive compensation at rates fixed by the Secretary of the Department of Health, Education, and Welfare, not to exceed \$50 per day, and shall also be entitled to receive an allowance for actual and necessary travel and subsistence expenses while so serving away from their places of residence.

Sec. 106. (a) For the purpose of carrying out the provisions of this title, there are authorized to be appropriated \$1,500,000 for each of the fiscal years beginning July 1, 1959, and July 1, 1960, and such amounts as may be necessary for the

eight succeeding fiscal years.

(b) The provisions of this title shall terminate on June 30, 1969.

TITLE II—TRAINING OF SPEECH PATHOLOGISTS AND AUDIOLOGISTS

Sec. 201. In order to encourage and facilitate the training of speech pathologists and audiologists, the Director of the Office of Vocational Rehabilitation (hereinafter in this title referred to as the "Director") shall, in cooperation with the Advisory Committee on Speech and Hearing Disabilities (established by section 205 and hereinafter in this title referred to as the "Advisory Committee"), establish and conduct a program of grants-in-aid to public and nonprofit institutions of higher education which are engaged in the training of speech pathologists and audiologists to assist such institutions in providing such training and in recruiting persons to receive such training. Such grants-in-aid shall be made only to institutions of higher education which have been approved by the Director as offering programs of such nature and content as to enable students who have successfully completed such programs to qualify for an advanced certificate in speech pathology or audiology from a recognized national accrediting body. Such grants-in-aid shall be used by such institutions to assist in covering the cost of courses of graduate training and study leading to the master's or doctor's degree and for establishing and maintaining graduate fellowships with such stipends as may be determined by the Director. The Director shall submit all applications for grants-in-aid under this title to the Advisory Committee for its review and recommendations, and the Director shall not approve any such application before he has received and studied the recommendations of the Advisory Committee with respect to such application, unless the Advisory Committee shall have failed to submit its recommendations to him after having had adequate time to do so.

Sec. 202. Payments of grants-in-aid pursuant to this title may be made by the Director from time to time, in advance or by way of reimbursement, on such conditions as the Director may determine, including the making of such reports as the Director may determine to be necessary to carry out the provisions of this title. Such payments shall be made only to institutions approved for the train-

ing of speech pathologists or audiologists by the Director.

Sec. 203. For the purposes of this title the term "nonprofit" as applied to an institution of higher education, means an institution owned and operated by one or more corporations or associations no part of the net earnings of which inures, or may lawfully injure, to the benefit of any private shareholder or individual.

SEC. 204. The Director is authorized to delegate any of his functions under this title, except the making of regulations, to any officer or employee of the

Office of Vocational Rehabilitation.

Sec. 205. (a) There is hereby established in the Office of Vocational Rehabilitation an Advisory Committee on Speech and Hearing Disabilities. The Advisory Committee shall consist of the Director, who shall be Chairman, and twelve persons, appointed without regard to the civil-service laws, by the Director with the approval of the Secretary of the Department of Health, Education, and Welfare. Six of such appointed members shall be individuals who devote a major part of their efforts to departments of speech pathology and audiology in institutions of higher education and who shall be chosen so as to reflect varied specialties represented in such departments, three shall be individuals chosen from the ranks of professional people actively engaged in the diagnosis, training, or rehabilitation of individuals suffering serious speech or hearing impairments, and three shall be individuals representative of the lay public who have demonstrated an interest in the problem of speech and hearing disabilities.

(b) The appointed members of the Advisory Committee shall hold office for a term of four years, except that (1) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed shall be appointed for the remainder of such term, and (2) the terms of the members first taking office after the date of enactment of this title shall expire, as designated by the Director at the time of appointment, three at the end of four years after such date, three at the end of two years after such date, and three at the end of one year after such date. None of the appointed members shall be eligible for reappointed members shall be eligible for reappointed members.

ment until a year has elapsed since the end of his preceding term.

(c) The Advisory Committee shall periodically review the operations of the grants-in-aid program established pursuant to this title with a view to deter-

mining the extent to which such program is succeeding in carrying out the purposes for which it was established. On the basis of such reviews the Advisory Committee shall submit to the Director such recommendations with respect to the operation and administration of the program as it may deem advisable, together with any recommendations for legislation which it may deem necessary or desirable to carry out the purposes for which this title was enacted. Such recommendations, together with the Director's comments thereon, shall be referred to the Secretary of Health, Education, and Welfare for transmittal by him to the

(d) The Advisory Committee shall review all applications for grants-in-aid under this title and shall recommend to the Director the approval of such applications as, in the opinion of the Advisory Committee, contribute to the carrying out of the purposes of this title, and the disapproval of such applications as, in the opinion of the Advisory Committee, do not contribute to the

carrying out of such purposes.

(e) The Director may utilize the services of any member or members of the Advisory Committee in connection with matters relating to the provisions of this title, for such periods, in addition to conference periods, as he may

determine.

(f) Members of the Advisory Committee shall, while serving on business of the Advisory Committee or at the request of the Director under subsection (e) of this section, receive compensation at rates fixed by the Secretary of the Department of Health, Education, and Welfare, not to exceed \$50 per day, and shall also be entitled to receive an allowance for actual and necessary travel and subsistence expenses while so serving away from their places of residence.

Sec. 206. (a) For the purpose of carrying out the provisions of this title, there are authorized to be appropriated \$2,000,000 for each of the fiscal years beginning July 1, 1959, and July 1, 1960, and such amounts as may be necessary

for the eight succeeding fiscal years.

(b) The provisions of this title shall terminate on June 30, 1969.

[H.J. Res. 488, 86th Cong., 1st sess.]

JOINT RESOLUTION To help make available to those children in our country who are handicapped by deafness the specially trained teachers of the deaf needed to develop their abilities and to help make available to individuals suffering speech and hearing impairments those specially trained speech pathologists and audiologists needed to help them overcome their handicaps

Whereas to meet the educational needs of some thirty thousand deaf children of school age in the United States requires the training of some five hundred teachers of the deaf annually; and

Whereas fewer than one hundred and fifty such teachers are in training this

academic year; and

Whereas at least six of the institutions accredited for the training of teachers of the deaf have no trainees enrolled for the current academic year; and

Whereas, while the number of deaf children enrolled in special schools or classes increased by four hundred a year over the previous ten years, the increase in 1959 was more than twelve hundred; and

Whereas teachers of the deaf are needed in all States, and the institutions currently accredited for the training of teachers of the deaf have the facilities for meeting the needs of all the States for such teachers; and

Whereas each State cannot and should not undertake a wasteful duplication

of facilities and faculties; and

Whereas some eight million Americans of all ages suffer from speech or hearing impairments of such nature as to seriously handicap them in their efforts to become self-supporting, self-sufficient taxpaying members of their communities;

Whereas the medical, social, emotional, educational, and rehabilitation problems of this large section of our population result from speech and hearing defects a majority of which are remediable; and

Whereas some twenty thousand speech pathologists and audiologists are needed to properly diagnose, train, and rehabilitate these eight million handicapped peo-

ple: and

Whereas to meet this need there are at present in the United States only some two thousand certified speech pathologists and audiologists and some five thousand noncertified specialists in this field; and

Whereas in order to begin to cope with the problems resulting from the critical shortage of trained personnel in this field it is estimated that our universities should be graduating at least one thousand five hundred properly trained speech pathologists and audiologists each year; and

Whereas only four hundred specially trained speech pathologists and audio-

logists are being graduated each year; and

Whereas speech pathologists and audiologists are needed in all States to staff

schools, hospitals, and community service centers; and

Whereas, each State cannot and should not undertake a wasteful duplication of tracilities and faculties for the training of speech pathologists and audiologists: Now, therefore, be it

Resolved by the Senate and House of Representatives of the United States of

America in Congress assembled,

TITLE I-TRAINING OF TEACHERS OF THE DEAF

Sec. 101. In order to encourage and facilitate the training of teachers of the deaf, the Commissioner of Education (hereinafter in this title referred to as the "Commissioner") shall, in cooperation with the Advisory Committee on the Training of Teachers of the Deaf (established by section 105 and hereinafter in this title referred to as the "Advisory Committee"), establish and conduct a program of grants-in-aid to public and nonprofit institutions which are engaged in the training of teachers of the deaf and which are affiliated with recognized public or other nonprofit institutions of higher education to assist such institutions in providing such training. Such grants-in-aid shall be used by such institutions to assist in covering the cost of courses of training and study for teachers of the deaf and for establishing and maintaining scholarships for qualified persons who desire to enroll in such courses of training and study, the stipends of any such scholarships to be determined by the Commissioner. The Commissioner shall submit all applications for grants-in-aid under this title to the Advisory Committee for its review and recommendations, and the Commissioner shall not approve any such application before he has received and studied the recommendations of the Advisory Committee with respect to such application, unless the Advisory Committee shall have failed to submit its recommendations to him after having had adequate time to do so.

Sec. 102. Payments of grants-in-aid pursuant to this title shall be made by the Commissioner from time to time and on such conditions as he may determine, including the making of such reports as the Commissioner may determine to be necessary to carry out the provisions of this title. Such payments may be made either in advance or by way of reimbursement and shall be made only to institutions approved by the Commissioner for the training of teachers of the deaf.

Sec. 103. For the purposes of this title the term "nonprofit", as applied to an institution, means an institution owned and operated by one or more corporations or associations no part of the net earnings of which inures, or may lawfully

inure, to the benefit of any private shareholder or individual.

SEC. 104. The Commissioner is authorized to delegate any of his functions under this title, except the making of regulations, to any officer or employee

of the Office of Education.

SEC. 105. (a) There is hereby established in the Office of Education an Advisory Committee on the Training of Teachers of the Deaf. The Advisory Committee shall consist of the Commissioner, who shall be Chairman, and twelve persons appointed, without regard to the civil service laws, by the Commissioner with the approval of the Secretary of the Department of Health, Education, and Welfare. Six of such appointed members shall be individuals identified with institutions engaged in the training of teachers of the deaf; three shall be individuals identified with institutions engaged in the training of teachers of the deaf; and three shall be individuals representative of the lay public who have demonstrated an interest in the education of the deaf.

(b) The appointed members of the Advisory Committee shall hold office for a term of four years, except that (1) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed shall be appointed for the remainder of such term, and (2) the terms of the members first taking office after the date of enactment of this title shall expire, as designated by the Commissioner at the time of appointment, three at the end of four years after such date, three at the end of three years after such date, three at the end of one year after

such date. None of the appointed members shall be eligible for reappointment

until a year has elapsed since the end of his preceding term.

(c) The Advisory Committee shall periodically review the operations of the grants-in-aid program established pursuant to this title with a view to determining the extent to which such program is succeeding in carrying out the purposes for which it was established. On the basis of such reviews the Advisory Committee shall submit to the Commissioner such recommendations with respect to the operation and administration of the program as it may deem advisable, together with any recommendations for legislation which it may deem necessary or desirable to carry out the purposes for which this title was enacted. Such recommendations, together with the Commissioner's comments thereon, shall be referred to the Secretary of Health, Education, and Welfare for transmittal by him to the Congress.

(d) The Advisory Committee shall review all applications for grants-in-aid under this title and shall recommend to the Commissioner the approval of such applications as, in the opinion of the Advisory Committee, contribute to the carrying out of the purposes of this title, and the disapproval of such applications as, in the opinion of the Advisory Committee, do not contribute to the

carrying out of such purposes.

(e) The Commissioner may utilize the services of any member or members of the Advisory Committee in connection with matters relating to the provisions of this title, for such periods, in addition to conference periods, as he may

determine.

(f) Members of the Advisory Committee shall, while serving on business of the Advisory Committee or at the request of the Commissioner under subsection (e) of this section, receive compensation at rates fixed by the Secretary of the Department of Health, Education, and Welfare, not to exceed \$50 per day, and shall also be entitled to receive an allowance for actual and necessary travel and subsistence expenses while so serving away from their places of residence.

Sec. 106. (a) For the purpose of carrying out the provisions of this title, there are authorized to be appropriated \$1,500,000 for each of the fiscal years beginning July 1, 1959, and July 1, 1960, and such amounts as may be necessary

for the eight succeeding fiscal years.

(b) The provisions of this title shall terminate on June 30, 1969.

TITLE II—TRAINING OF SPEECH PATHOLOGISTS AND AUDIOLOGISTS

Sec. 201. In order to encourage and facilitate the training of speech pathologists and audiologists, the Director of the Office of Vocational Rehabilitation (hereinafter in this title referred to as the "Director") shall, in cooperation with the Advisory Committee on Speech and Hearing Disabilities (established by section 205 and hereinafter in this title referred to as the "Advisory Committee"), establish and conduct a program of grants-in-aid to public and nonprofit institutions of higher education which are engaged in the training of speech pathologists and audiologists to assist such institutions in providing such training and in recruiting persons to receive such training. Such grants-in-aid shall be made only to institutions of higher education which have been approved by the Director as offering programs of such nature and content as to enable students who have successfully completed such programs to qualify for an advanced certificate in speech pathology or audiology from a recognized national accrediting body. Such grants-in-aid shall be used by such institutions to assist in covering the cost of courses of graduate training and study leading to the master's or doctor's degree and for establishing and maintaining graduate fellowships with such stipends as may be determined by the Director. The Director shall submit all applications for grants-in-aid under this title to the Advisory Committee for its review and recommendations, and the Director shall not approve any such application before he has received and studied the recommendations of the Advisory Committee with respect to such application, unless the Advisory Committee shall have failed to submit its recommendations to him after having had adequate time to do so.

Sec. 202. Payments of grants-in-aid pursuant to this title may be made by the Director from time to time, in advance or by way of reimbursement, on such conditions as the Director may determine, including the making of such reports as the Director may determine to be necessary to carry out the provisions of this title. Such payments shall be made only to institutions approved for the

training of speech pathologists or audiologists by the Director.

Sec. 203. For the purposes of this title the term "nonprofit", as applied to an institution of higher education, means an institution owned and operated by one or more corporations or associations no part of the net earnings of which inures, or may lawfully inure, to the benefit of any private shareholder or individual.

Sec. 204. The Director is authorized to delegate any of his functions under this title, except the making of regulations, to any officer or employee of the Office

of Vocational Rehabilitation.

SEC. 205. (a) There is hereby established in the Office of Vocational Rehabilitation an Advisory Committee on Speech and Hearing Disabilities. The Advisory Committee shall consist of the Director, who shall be Chairman, and twelve persons, appointed without regard to the civil service laws, by the Director with the approval of the Secretary of the Department of Health, Education, and Welfare. Six of such appointed members shall be individuals who devote a major part of their efforts to departments of speech pathology and audiology in institutions of higher education and who shall be chosen so as to reflect varied specialties represented in such departments, three shall be individuals chosen from the ranks of professional people actively engaged in the diagnosis, training, or rehabilitation of individuals suffering serious speech or hearing impairments, and three shall be individuals representative of the lay public who have demonstrated an interest in the problem of speech and hearing disabilities.

(b) The appointed members of the Advisory Committee shall hold office for a term of four years, except that (1) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed shall be appointed for the remainder of such term, and (2) the terms of the members first taking office after the date of enactment of this title shall expire, as designated by the Director at the time of appointment, three at the end of four years after such date, three at the end of two years after such date, and three at the end of one year after such date. None of the appointed members shall be eligible for reappoints.

ment until a year has elapsed since the end of his preceding term.

(c) The Advisory Committee shall periodically review the operations of the grants-in-aid program established pursuant to this title with a view to determining the extent to which such program is succeeding in carrying out the purposes for which it was established. On the basis of such reviews the Advisory. Committee shall submit to the Director such recommendations with respect to the operation and administration of the program as it may deem advisable, together with any recommendations for legislation which it may deem necessary or desirable to carry out the purposes for which this title was enacted. Such recommendations, together with the Director's comments thereon, shall be referred to the Secretary of Health, Education, and Welfare for transmittal by him to the Congress.

(d) The Advisory Committee shall review all applications for grants-in-aid under this title and shall recommend to the Director the approval of such applications as, in the opinion of the Advisory Committee, contribute to the carrying out of the purposes of this title, and the disapproval of such applications as, in the opinion of the Advisory Committee, do not contribute to the carrying

out of such purposes.

(e) The Director may utilize the services of any member or members of the Advisory Committee in connection with matters relating to the provisions of this title, for such periods, in addition to conference periods as he may determine.

(f) Members of the Advisory Committee shall, while serving on business of the Advisory Committee or at the request of the Director under subsection (e) of this section, receive compensation at rates fixed by the Secretary of the Department of Health, Education, and Welfare, not to exceed \$50 per day, and shall also be entitled to receive an allowance for actual and necessary travel and subsistence expenses while so serving away from their places of residence.

SEC. 206. (a) For the purpose of carrying out the provisions of this title, there are authorized to be appropriated \$2,000,000 for each of the fiscal years beginning July 1, 1959, and July 1, 1960, and such amounts as may be necessary for the

eight succeeding fiscal years.

(b) The provisions of this title shall terminate on June 30, 1969.

Mr. Elliott. Our first witness today is the gentleman from New York, Mr. Lindsay, in whose congressional district these hearings are being held.

STATEMENT OF HON. JOHN V. LINDSAY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK

Mr. Lindsay. Mr. Chairman and members of the committee, first of all, I should like to thank you, Mr. Chairman, for your courtesy to me in inviting me to sit with you on these hearings on as important a subject as this. I think you have done a great service, and the members of the subcommittee, not only in undertaking this study but in

coming to New York City to hold hearings on the subject.

In this city, as I am sure you are aware, this subject is of paramount importance. In fact, nothing that I can think of domestically at the moment is of such great concern to people as a whole. Obviously, the Federal Government cannot undertake to cure all of the ills of the Nation from the top to the bottom, every age level, and of every kind and description, but clearly there is a Federal responsibility in certain defined areas where it has been proven that the local communities cannot possibly cope with the total situation.

Let me, in just the very few brief moments that I have, initially record my enthusiasm for your bill, Mr. Chairman, House Joint Resolution 494, which undertakes to provide a modest, and I would think minimum, degree of Federal responsibility for the training of teachers.

specialists, that is, in the area of total deafness.

This is increasingly a national problem. Medical science has been able to bring about conditions under which mothers give birth to children where, decades ago, the children probably might not have lived. There are increasing medical problems, obviously, sometimes caused

by this.

To me it is not logical to say that the National Defense Education Act, which is now in effect and which provides Federal assistance on a matching basis for the teaching of professional people in the areas of languages and sciences, where there have been such demonstrated shortages, to say that that same kind of thinking and philosophy should not extend also to other areas where there is demonstrated need, and demonstrated need particularly for experts in a highly technical educational sense, of a very high degree of professional capacity.

Just let me point out one area on this subject. The Lexington School for the Deaf, which occupies a leadership position in this whole field, is located just 20 or 30 blocks uptown on 68th Street and Lexington Avenue. The Lexington School for the Deaf really is a leader in this field. They do not take children unless they are totally deaf.

The subcommittee should realize, first of all, that in that particular school there is no charge for tuition for the children. It is a private school, but it operates largely on State assistance. However, here is the problem: All of the technical aids in the world, such as electronic equipment and that kind of thing, is necessary, and we must have it, and it is obtainable, but none of that is any good unless you have high-caliber skilled teachers.

At the Lexington School for the Deaf they have student teachers in residence from all over the country who are being trained for this specialized service. But do you realize that they have to pay a tuition for the privilege of being educated technically so that they can go on

and spend the rest of their lives devoted in this field?

It is expensive to live in New York. At least, they have rooms at the Lexington School for the Deaf so that these teachers can be housed. But their tuition fee must be paid by them in toto. Then, of course, you must realize also that they already have their B.A. degree and in

a great many cases their M.A. or Ph. D. degrees.

So here they go on for specialized training in this all-important field where, believe me, you and I would be astonished, I am sure, to see the things that they do with these deaf children. Then they go on, and in the city of New York, for example, they become teachers, teaching for the deaf, and yet their salaries are less than the average public-school teacher in the city of New York, and their qualifications must be twice as high.

So if there is a need for Federal assistance in the area of languages and sciences, where the shortages have been already demonstrated, then certainly here is an area of increasing importance, as modern science grows, where the Federal Government, I think, has some responsibility.

I am happy to note that I received a letter from the Department of Health, Education, and Welfare the other day on this subject. First of all, let me say that the Department was most enthusiastic about the cooperation they had been receiving from you, Mr. Chairman, in this whole area.

With regard to their thinking on the subject of this particular bill, the assistance to the teacher training of the deaf, they state:

The Department's position has not progressed to the point where we can definitely outline the extent to which we can support such measures. However, there is strong feeling within the Department that this is not only a worthy but also a necessary program.

I have just one word on the second most important bill—it certainly isn't second in importance, but it is the second I want to mention your bill, Mr. Chairman, H.R. 3465, on independent living.

again, is an area of huge importance.

As I sit in my congressional office here in the city of New York and constituents come in with their problems, of high priority among the problems that do come in is the area of people who are chronically disabled, but who do not come under one of the great assistance areas, such as foundation assistance.

There was one the other day, for example, whose daughter had been totally paralyzed from the neck down, but no specialist could diagnose it as a polio case. Therefore, she did not come under the assistance program that the Polio Foundation is ready to give. Doctors would like to have diagnosed it as polio, but they could not do it.

This particular constituent said:

I am not asking for anything for myself. I need full-time help for this child. I need special teachers. I can afford to pay for it, but I have become increasingly interested in the problem.

One thing it seems to me that a congressional examination could do would be to see whether there are any means by which some of these huge voluntary foundations, for example, engaged in programs such as polio and heart, could be encouraged to expand their activities to take into account the undiagnosed problems.

Other people have the same problem as I do, and there are literally thousands of them in New York City, and obviously cannot afford the kind of thing I can afford.

I was happy to note also in the letter that I received from the Department of Health, Education, and Welfare, from the Acting Assistant Secretary in charge of legislation, that on your bill, Mr. Chairman, on this subject of independent living, that the Department "favors the approach taken in these bills and is considering additional suggested legislation in the general area of independent living."

I am very happy to see that this continual working relationship has existed between the subcommittee and the Department of Health, Education, and Welfare. Again I congratulate you, Mr. Chairman, and the members of the subcommittee, for having had the courage and taking the time to examine this subject with the thoroughness

that you obviously are examining it.

Thank you very much.

Mr. Elliotr. Thank you, Congressman Lindsay. We are happy to be in your Congressional District and we are happy to hear you.

Our next witness today is Mr. M. E. Freelund, executive director,

National Organization for Mentally Ill Children, Inc.

Mr. Freelund, you may proceed in accordance with our understanding that we must do our best to hold our witnesses within the period of about 10 minutes.

STATEMENT OF M. E. FREELUND, EXECUTIVE DIRECTOR, NATIONAL ORGANIZATION FOR MENTALLY ILL CHILDREN, INC.

Mr. Freelund. Thank you very much, Mr. Chairman, and members of your committee, for the opportunity to appear.

As you know from the name of our organization, I speak in behalf

of the mentally ill children of this country.

Mr. Elliott. Mr. Freelund, before you get started, do you have

a written statement for the record?

Mr. Freelund. Unhappily, not yet. I have it just in rough form. I would like permission from the Chair to submit this sometime during the day, if I may, or tomorrow, while the hearing is in session.

Mr. Elliott. Without objection, the statement of Mr. Freelund

will be included when submitted to the subcommittee.

Mr. Freelund. Thank you.

I will first address myself to the initial area outlined by your committee and speak of urgent needs in special education and rehabilitation for these children. Such a question sincerely posed sharply points up the tragic plight of the Nation's mentally ill children, estimated to number about half a million, perhaps the largest single group among the country's most neglected handicapped and afflicted children, for not only is there virtually a total lack of special educational services and facilities, and programs of rehabilitation for these children, there is also in literally no community in the country any adequate and effective service available for their care and treatment.

In connection with the upcoming 1960 White House Conference on Children and Youth, my organization has prepared a report which summarizes the total problem of childhood mental illness and states the role of the national organization, and poses some question in the general area of unmet needs, apart from those specifically delineated

by this committee.

With the permission of the Chair and the members of the committee, I should like to submit this for the record or for the perusal of the committee, as it deems appropriate.

Mr. Elliott. The statement of the gentleman will be received and

will be made a part of the files of the subcommittee.

Mr. Freelund. It is, of course, our purpose and intention to collaborate and work very closely with the study under the auspices of

this committee.

In a country so responsive to the needs of the affilicted, how do we explain our neglect of this large group of handicapped children? We are told that the problem has been recognized for only a relatively short time. It is only in the last 20 years, for example, that childhood schizophrenia and infantile autism have been disagnosed. Psychiatric care is expensive and we still have insufficient knowledge concerning the causes and cure of mental illness. However, enough work has been done by responsible professional investigators to justify setting up constructive programs and continuing research.

Parents of seriously disturbed children did not organize until rather recently to seek help for their children because the fear of stigma made them reluctant to identify themselves as the parents of mentally ill children. Since mental illness is neither fatal nor physi-

cally crippling, it is difficult to mobilize public support.

The family of the mentally ill child, unlike that of other handicapped children, finds little understanding or help in the community. Instead of the spontaneous assistance offered to the physically handicapped, their child is treated with fear and apprehension. The child's illness is baffling and the parents are often burdened with a crushing sense of guilt or responsibility for the illness.

Fortunately, a large body of psychiatric opinion does not hold the parents or the environment solely responsible and is helping to relieve

one source of great anxiety from these families. For example, Dr. Loretta Bender has written:

We have not found that these emotionally disturbed, atypically developed, schizophrenic children come from any special type or home of parents; they come equally from homes of intelligent, sophisticated, economically secure parents and from the unintelligent, naive, and underprivileged. They come from concerned, cooperative, two-parent families, and from grossly deviate, antisocial, abandoning parents. Some parents have grown emotionally in their efforts to meet their children's needs and are articulate about their problems. Other parents have met failure with depression and psychotic breakdowns.

We believe-

goes on Dr. Bender stating her own opinion-

that no child will become schizophrenic regardless of the type of home situation or the care he received as an infant unless he has been born with this inherent factor. However, it is certainly true that the kinds of home life and personal care during infancy will very much influence the way the child reacts to his inborn tendency to illness.

Finding help for the mentally ill child is a discouraging and often demoralizing search. Diagnostic terms are confusing and not reassuring. Prognosis for the same child will range from the extreme of complete hopelessness to the optimism of "he will outgrow it."

Yet in many instances, the development of the child refutes either. Private psychiatric treatment is too expensive for most families and clinical facilities are usually available for children with better prog-

nosis. This is a bitter reality for the parent to accept, since we have been lead to believe that the more serious the illness, the more urgent the need for treatment.

From an administrative and budgetary point of view, it is no doubt logical to take those cases with better prognosis. Yet in the case of seriously disturbed children, mentally ill children, have we enough

objective information to know certainly which will improve?

On the subject of prognosis, Dr. Bender has written, and I cite this particularly to the attention of your committee in connection with your concern about education and special education for these children. Dr. Bender has written:

Our longitudinal studies showed that one-third of the children had remained so withdrawn or disturbed that they never were able to get along in a normal school or social situation. One-third were part of the time in partial adjustment. The best one-third were able at least part of the time to get along quite well in a limited school or social situation. A few have done very well indeed in high school, college, military service, or supporting themselves. Of course, both they and their parents have needed a great deal of support and guidance and many changes in treatment programs.

Most public schools exclude the seriously disturbed child. Private schools are costly. The effect of this frustration in finding help creates growing tension in the family. This anxiety inevitably is com-

municated to the troubled child.

If there are brothers and sisters in the family, they will be caught in this chain reaction as they become aware of the family tension, the attitude of neighbors, and the constant demands made on their parents by the sick child.

We must provide an educational program which will help the community accept the mentally ill child as a sick child, and assume respon-

sibility for his care.

Another reason advanced for the failure to embark on a comprehensive program of help for the mentally ill child is the lack of specific knowledge on the incidence of mental illness in children. Never has any definitive study been made, but enough is known, of course, to

demonstrate that the need is far greater than the facilities.

I am pleased to state before this committee that the Biometrics Division of the U.S. Department of Health, Education, and Welfare has begun to work with our organization on a systematic compilation of statistical data in a meaningful way that will yield much information, not only about incidence itself, but about needs and about programs and the whole range of data that will be very useful in dealing with this problem. I am pleased to say that they are cooperating with us in this effort.

I am mindful of the time and I do not want to overrun. But I would like to sum up this part of my comment by saying that our organization, since its inception some 10 years ago, has sponsored private day schools, maintained at great cost and under constant threat of abandonment because of the difficulty of financing, where we have shown and demonstrated beyond any doubt that these children in the right kind of educational setting can be helped, that their very disabilities can provide, their very apprehensions, their very anxieties can provide, the bridge to academic learning. They have learned to read. Those who are autistic and noncommunicating have learned to speak.

The problem in special education in these children is to reach them first and then to teach them. As you are well aware, this kind of spe-

cialized setting is hard to come by.

I should just like to point out the specifics now in summing up of the needs in special education. We need institutions dedicated to the training and development of teaching personnel, where today they have no specialized curriculum related to the training of teachers who work with mentally handicapped or mentally ill children.

This kind of curriculum that has yet to be developed should include educational methodology and content as well as courses in normal childhood development and psychopathology in children. Further, it should include orientation and preparation for cooperative work with allied disciplines, such as psychiatry, psychology, social work, pediatrics, and neurology.

Graduate training of this kind should further include supervised fieldwork or supervised training in specific facilities that are directly

working with mentally ill children.

We suggest further that there is great need that any facility that renders direct services to mentally ill children on a day or in-patient business needs to provide on-going supervision and in-service training to such teachers, making them part of the working team of experts.

There is considerable variation and looseness in the amount and kind of in-service training now taking place in facilities rendering direct treatment and educational services to mentally ill children.

In the field of rehabilitation, which is also within the area of concern of this subcommittee, we feel the needs are raising of standards in care, treatment, and education of mentally ill children in State hospitals, with special attention to mentally ill adolescents, providing them with vocational guidance and training.

We feel there is need for provision of halfway houses or transitional day treatment facilities for children ready for discharge from in-patient facilities, where these halfway houses are charged with

responsibility of accepting State hospital patients.

We need also ancillary or helping services to child and family, to protect previous therapeutic investment and to maximize the child's ability to assume a limited though productive role in society. These must include sheltered workshops, protected employment, a full-scale educational program to convince industry to accept mentally ill people in employment, and social and psychological services for child and family to support and enable the child or young adult to take and maintain his place.

I suggest a particularly urgent and cogent reason for the enactment of specific legislation to support the training of leadership personnel in this field. In recent months, we have seen, for example, in New York State, the enactment of the Speino bill, which for the first time authorizes local school boards to make special provision for special educational facilities adapted to mentally ill and emotionally dis-

turbed children.

In New Jersey, they have enacted the Beidelsen bill, patterned after this. Pennsylvania is considering similar legislation. I suggest to the committee that this legislation, if enacted and as enacted, remains sterile and meaningless unless there be implementation of it. It is a proper role, I submit, for the Federal Government to stimulate and encourage not only the enactment of such State legislation, but also

its effective implementation.

Specifically, then, we suggest that it is the responsibility of the Federal Government to provide special training programs for the professional preparation of leadership personnel in the education of emotionally handicapped and mentally ill children. This can be done through fellowship programs and/or providing leadership through those installations involved in the training of teachers, whereby a comprehensive national program for training of leadership personnel for education in this specialized area is undertaken in every State in the Union.

The committee is well aware of the recent passage and enactment of Public Law 85-926, which authorizes the allocation of 150 graduate fellowships to the 50 State educational agencies and 14 universities, in a move to increase the number of leaders in the education of men-

tally retarded children.

We urge that a public law be written and enacted that would be uniquely and especially geared to the public assumption of responsibility for the training of educational leaders in the field of emotionally

handicapped and mentally ill chidren.

Mr. Chairman, I hope I have not overstayed my time. I had much more to say which I will incorporate in my written statement. I submit to your committee that the proposed legislation under consideration now for the benefit of the deaf and for the benefit of the blind, I believe it is, we heartily endorse.

We would like to see such legislation enacted for all handicapped children. We are in favor also of your bill, Mr. Chairman, for living

assistance.

Mr. Elliott. Thank you very much.

Our next witness is Mr. R. A. Loberfeld, executive vice president of the New York City Cancer Committee of the American Cancer Society, Inc.

Mr. Loberfeld, will you come forward, please?

Is Mr. Loberfeld here?

If not, our next witness is Mr. William H. Bristow, director, New York City Board of Education, Bureau of Curriculum Research.

Is Mr. Bristow here?

If not, our next witness is Miss Helen Holodnak. Miss Holodnak comes to us from the rehabilitation service, Kings County Chapter, Inc., of the National Multiple Sclerosis Society.

STATEMENT OF MISS HELEN B. HOLODNAK, KINGS COUNTY CHAP-TER, NATIONAL MULTIPLE SCLEROSIS SOCIETY, BROOKLYN, N.Y.

Miss Holodnak. May I make an amendment to my representation? I am representing the National Multiple Sclerosis Society and the Kings County Chapter of the National Multiple Sclerosis Society.

Mr. Elliott. You may proceed, Miss Holodnak.

Miss Holodnak. Recently the U.S. Public Health Service issued a bulletin to the press indicating that 10 percent, or about 17 million Americans, are limited in their ability to work, keep house, or pursue outdoor activities.

About 4,859,000 of this number have difficulty in moving about or require assistance in moving about. It was estimated that of these, approximately 1 million are completely confined to their homes.

In the light of this statement, the provisions for the severely disabled of the proposed bill, H.R. 3465, or the "Rehabilitation Act of 1959," have great significance both socially and economically. At the present time, the State rehabilitation agencies provide evaluation services for those who apply for vocational rehabilitation with the

ultimate goal of placement in the competitive labor market.

Those individuals who are not eligible for vocational rehabilitation programs or who cannot achieve vocational rehabilitation are excluded from the benefits of present legislation. The proposed legislation fills in gaps in legislation pertaining to rehabilitation, thereby making it possible for States to improve and broaden the scope of services to include the severely handicapped who can benefit from rehabilitation services, but who may not necessarily be able to achieve vocational rehabilitation.

Therefore, it is readily apparent how important this legislation is for those who fall in the group who are chronically ill, particularly

for the group we represent—the multiple sclerotic.

In the area of chronic illness, multiple sclerosis is a major medical problem. Dr. Thomas M. Rivers said that multiple sclerosis is the foremost neurological problem of our time. Multiple sclerosis is a chronic, usually progressive and crippling neurological disease

striking chiefly persons in the 20 to 40 age group.

There is a significantly higher prevalence in the North than in the South, a finding also true in Europe. It appears that slightly more women than men are afflicted. There is no difference found between ethnic, occupational, social, or economic groups, nor between rural and urban populations. The disease is typically slow and insidious in onset, frequently difficult to diagnose until symptoms have progressed to the point of extensive disability.

There is no specific diagnostic test for multiple sclerosis, the cause is unknown and no treatment of the many which have been tried and are being tried has been shown to alter the course of the disease. Occasionally there are unexplained instances of prolonged remission from the disease and usually individuals resume their normal

activities.

Dr. H. Houston Merritt states that multiple sclerosis is the greatest cause of chronic disability among young adults. It is estimated that there are 500,000 persons in the United States who are afflicted with multiple sclerosis and related demyelinating diseases. It is interesting to note that two-thirds to three-fourths of the cases have their onset between the ages of 20 to 40—the employable years—and that 1 in 400 young adults in this age group has multiple sclerosis or a related demyelinating disease.

The incidence of disease is less in the second and fifth decade, and there is a small percentage of cases found before the age of 10 and after the age of 50. The life expectancy of a multiple sclerotic approaches that of the average person, although he suffers from varying degrees of disability and is more susceptible to respiratory dis-

orders and intercurrent infections.

Since in the early stages of the disease the symptoms are usually mild and transient, a substantial percentage of multiple sclerotics work for a period of many years in their professions or chosen areas of work. However, for many, the point is reached where the disease has encroached upon their coordination and dexterity so that they

can no longer continue in their chosen work.

The needs of this group, at present, are being met in part by the State rehabilitation agencies for those individuals who are found to be capable of vocational rehabilitation and competitive employment. The rigid policy of accepting only those who can physically tolerate an 8-hour working day in competitive employment has deprived many of the opportunity for vocational rehabilitation and retraining and of employment on a part-time basis, commensurate with the individual's work tolerance.

Consideration should be given to the group who can benefit by vocational rehabilitation services but whose work tolerance is less than the traditional 8-hour day. Very often, in this group, the multiple sclerotic cannot travel in subways and buses at the height of the rush hour, but can manage quite adequately if he leaves a little after the morning rush, and starts home a little before the homeward rush.

Then there is the group who have been found not feasible for vocational rehabilitation, but for whom a prevocational or conditioning therapy program has been recommended, in order to ascertain whether

or not there is a rehabilitation potential.

Unfortunately, even in the large metropolitan area of New York, facilities are very limited, and such a recommendation often results in a closure of the case. There is a need for more nonprofit rehabilitation facilities which would provide prevocational and conditioning

therapy as well as other services.

For the severely disabled, the sheltered workshop offers opportunity for employment and for a measure of economic independence. One of the functions of a sheltered workshop is to foster and develop the skills and work capacity of the client to the point where he can make the transition to competitive employment. But for a substantial percentage of the chronically ill, the sheltered workshop will provide an opportunity for employment for the more severely disabled who cannot make the transition to competitive employment.

Sheltered workshop facilities are needed even in large metropolitan areas where some exist to provide opportunities for employment for the severely disabled. The chronically ill who are homebound constitute a residue of manpower for whom extremely limited facilities

for employment exist.

In a substantial percentage of multiple sclerotics, paralysis has limited ambulation to a few steps or has resulted in confinement to a wheelchair. Also restricted to their homes are those whose ability to manage physically is adequate, but who have developed symptoms of incontinence which preclude employment in the competitive labor

market or in a sheltered workshop.

For those who are confined to their homes for years, there is an urgent need for employment opportunities not only for the therapeutic aspect of employment, but for the economic aspect as well. Since an individual cannot qualify for disability benefits under social security until he is 50 years of age—providing he has met the necessary requirements—there is often a period of years of economic stress.

Usually the spouse must seek employment and the family lives marginally, or the family qualifies for some form of financial assist-

ance from an appropriate Government agency.

The development of employment opportunities for the homebound is an area which requires special emphasis and implementation. It is noteworthy that statistically the number of women stricken by multiple sclerosis and demyelinating diseases is slightly greater than for men. The preponderant majority of women are housewives, and many of them are in need of vocational rehabilitation services to enable them to function adequately as homemakers.

The importance of providing independent living rehabilitation services to the severely disabled cannot be overemphasized. It is in the public's interest and in the interest of our economy to provide the severely disabled with the opportunity to achieve a state of inde-

pendent living commensurate with their capacities.

Some of the severely disabled will become gainfully employed taxpayers. Some of those who are institutionalized in hospitals for the chronically ill or in nursing homes may be able to return to their homes or will require less assistance from attendants if they remain.

For those who are at home who can benefit, the provision of independent rehabilitation services will alleviate the financial strain upon families who have to purchase attendant care as well as the physical strain experienced by families in caring for the severely disabled day by day.

Dr. Thomas L. Willmon, medical and research director of the Na-

tional Multiple Sclerosis Society, states:

The problem posed by multiple sclerosis is twofold: It involves a large population; its cause is unknown; its course is unpredictable; and no specific treatment. has yet been found. The problem is believed soluble and progress is being

made in the scientific laboratories of the world.

While there is pressing need to complete the required research and reach the problem's solution, an immediate and overwhelming need is the care and management of the patients suffering the disabilities of multiple sclerosis. The magitude of the problem far exceeds the present ability or potential of the National Multiple Sclerosis Society, and if requirements are to be met in this and other problem of the chronically ill, the aid of the collective people of the Nation through State and/or Federal provisions must be enlisted.

Thank you very much.

Mr. Elliott. Thank you very much. Are there any questions? The gentleman from New York has a question.

Mr. Lindsay. Can you state how much is raised annually by the National MS Society and how much is contributed toward this prob-

lem by the States? Do you know those figures?

Miss Holodnak. Offhand I can't give you the exact amount raised by the national society. It is several million. I cannot give you the exact figure. I can state that last year, the last fiscal year, approximately \$300,000 of the funds raised went for the support of medical research.

According to the charter which each chapter obtains from the national society, 40 percent of all the funds raised by each chapter, which is autonomous in its government, is given to the national society for the conducting of our national program and for the support of our medical research. Sixty percent remains in each local chapter for the conducting of the chapter's business and for patient services.

No State agency or Federal agency, to my knowledge, makes a direct contribution for services for the patients except where, by legal provision, certain benefits can be given. For example, in the vocational rehabilitation program, restoration, physical restoration, and transportation, and prosthesis, et cetera, except in that setting I know of no support for the direct care and service of the multiple sclerotic and, of course, for those who fall in the same category.

I would like to go on record as stating that I believe that this proposed bill, H.R. 3465, which I fondly call the Elliott bill, I believe that it is one of the most progressive pieces of legislation relating to the rehabilitation needs of our citizens that has seen the light of day.

I consider it an honor and a privilege to behold those who are serving on this committee and those who are vitally interested in this bill. I can assure you that every multiple sclerotic in the country is praying real hard day by day that this goes through next year.

Mr. Elliott. Thank you very much.

Are there any other questions?

At this point the record will carry the statement of the Honorable John E. Fogarty, U.S. Representative from the Second Congressional District of Rhode Island, with respect to his bill, House Joint Resolution 316, House Joint Resolution 488, the speech and hearing bill.

(The statement referred to follows:)

STATEMENT OF HON. JOHN E. FOGARTY, U.S. REPRESENTATIVE OF THE SECOND CONGRESSIONAL DISTRICT OF RHODE ISLAND

Mr. Chairman, I am indeed pleased to have the opportunity to appear as a witness at these hearings and to discuss the proposed legislation reflected in House Joint Resolution 316 and the subsequent proposal, House Joint Resolution 488, both of which I have cosponsored with our good friend, Senator Lister Hill.

Most of my colleagues in the House of Representatives are aware of my deep

personal interest in matters affecting the public health.

For the last 12 of my 18 years in Congress I have been active on the Health Subcommittee on Appropriations, either as chairman or as ranking member of the minority.

During this time I have taken great pride in the part I have been privileged to play in the establishment of broad, forward-looking programs of research in the medical and biological sciences. These programs, focusing on the major crippling diseases that chronically afflict mankind, as you know are supported and conducted by the National Institutes of Health of the Public Health Service.

Now it is my pleasure to speak in behalf of a similar program in a related area I believe is worthy of this subcommittee's most serious consideration.

I refer to the legislation before you. It proposes the creation of a system of grants-in-aid in support of the recruitment and training of teachers of the deaf, speech pathologists, and audiologists. Why is legislation of this kind necessary? Is there truly an urgent need for it?

I would like to describe the problem to you, briefly.

About one-twentieth of our population—some 8 million or more persons of all ages—is afflicted with hearing and associated speech disorders.

These impairments are not only a source of constant personal embarrassment to the sufferer, they also represent a terrible handicap to the individual in his efforts to achieve a normal, self-supporting status in the community.

The sad part is that the great majority of these people, if given the chance, are fully capable of learning how to develop their other abilities. All they need to attain their rightful places in society is the proper professional help. Therein lies the problem.

And the problem is this: Our supply of teachers and specialists trained and qualified to work in the field of speech and hearing therapy is totally inadequate. Lack of sufficient people trained to do the work is preventing the rehabilitation of a large segment of our handlcapped but useful work force. The cost in wasted lives is, of course, immeasurable.

Moreover, the burden on the taxpayer who must pay to support the deaf and those with impaired speech in institutions is intolerable. Let me present some

figures to illustrate the point.

Today we have 30,000 deaf children of school age. Each year this total increases. A merely adequate student-teacher ratio calls for 500 new teachers each year, but fewer than 150 are being trained this year. Of the institutions accredited for training of teachers of the deaf, six do not have a single student enrolled.

For persons suffering from speech defects, fully 20,000 speech pathologists and audiologists are needed. Yet, today there are only 2,000 of these professionals certified as having successfully completed advanced training. Another 5,000 bear the label "uncertified" specialists. Although there is an acute need for 1,500 meets the new label and the property of the pr

1,500 speech therapists annually, barely 400 are graduated each year.

All of this paints a sombre picture, especially where the children are concerned. In stark terms, scarcely more than one child in five who needs speech or hearing

therapy is getting it.

All of this paints a somber picture, especially where the children are concerned, to one section or region of the country. It is nationwide in extent. Although many of the States have special programs for rehabilitation and training of people with speech and hearing defects, they are unable to cope with the total problem. The problem that exists today is a clear-cut example of the type that should be attacked by having the Federal Government assume an appropriate

share of the burden. The proposed legislation will do this.

The Federal Government has very effective treatment and rehabilitation programs for the deaf and hard of hearing for members of the Armed Forces and for veterans. The medical services of the Army and Navy and Veterans' Administration have made rapid advances in caring for the deaf, the hard of hearing, and those suffering from associated speech defects. The success of these programs automatically raised the question: What is being done to meet the needs of the Nation's schoolchildren, its aged, and the members of its work force in their most productive years?

Congress must act in this matter. We can be excused, perhaps, along with the average citizen, for not having faced this issue until now. Disorders of this kind are simply not dramatic enough to command attention in the way that

certain of the chronic illnesses have.

But here and now we have a marvelous opportunity to perform a great good by investing a minimum amount of money in a field where dividends and bonuses

are sure to be paid again and again.

We know that deafness and speech defects can be dealt with on a training and rehabilitation level. The point I want to make is that we must do all we can to see that more and more young people are encouraged to take an interest in the field of speech therapy and the teaching of the deaf.

The present bill is intended to resolve some of these manpower training diffi-

culties. Let us see what exactly are the provisions of the bill.

First, it calls for the creation of a grants-in-aid program to be administered by the Commissioner of the Office of Education. These grants will be awarded to accerdited public and nonprofit institutions in support of training for teachers of the deaf. These grants may be used by the institutions to assist in recruiting and training teachers, covering the cost of training and study, and for establishing and maintaining scholarships.

The grant applications will be considered by an advisory board of 12, established in the Office of Education. The members of the Advisory Board will be appointed by the Commissioner of Education with the approval of the Secretary of Health, Education, and Welfare. Incidentally, this follows the review and approval pattern that has functioned so well in the Public Health Service sup-

port of research and research training for the past several years.

Second, to aid in filling the need for more speech pathologists and audiologists, and to diagnose, train, and rehabilitate those with speech and hearing defects, the bill provides for grants-in-aid to assist public and other nonprofit institutions of higher education in recruiting and training speech pathologists and

audiologists.

Similarly, grants provided under this phase of the program must be reviewed and recommended by an advisory committee of 12, established in the Office of Vocational Rehabilitation. The proposed legislation incorporates requirements that assure a high caliber of trained personnel. For example, only approved institutions of higher learning which qualify their graduates for an advanced

certificate in speech pathology or audiology from a recognized national accrediting body will be given grants.

These grants may be used by such institutions to help defray the cost of courses of graduate training and study and for establishing and maintaining

graduate fellowships.

What harvest of benefits do I visualize from this scattered seed?

Mr. Chairman, I am reminded of an earlier day, some 15 years past, that marked the beginning of a mighty surge forward in the field of health research.

Those of us who witnessed the impressive start made by the National Institutes of Health soon realized that if it was going to maintain stride and keep from losing pace, we would have to take the necessary steps to assure a proper balance—on a national scale—between support of medical and biological research and an adequate pool of trained manpower with the capacity for conceiving and exploring research ideas.

Progress in expanding the support of research—even at the comparatively low levels of the late forties—had outstripped the development of trained manpower; the next step was clearly marked. Expanded programs in support of research were not the entire answer. We needed broad new programs in support of training to cope with the rapidly widening demand for research man-

power.

Alerted to this new need, the American people promptly urged appropriate action by the Congress. The results achieved by the Public Health Service through the research training programs administered at NIH have emerged as an important facet in the progress of medical research in the 20th century.

It seems wholly logical, therefore, to propose that we take advantage of past success to achieve future goals. Let us put to use the theme of maintaining balance between the basic elements of speech and hearing rehabilitation programs in the same pattern that was applied to the whole field of medical research over 10 years ago.

Today, our knowledge of hearings and speech disorders is far greater than our capacities for applying that knowledge through adequately trained personnel. We cannot begin to apply our research findings on a clinical basis until the number of professionally trained teachers and speech pathologists and audiologists has been multiplied substantially.

If we are to help salvage any part of the 8 million persons afflicted with deafness and speech impairments, we must strive to balance our efforts by matching

manpower strength with research potentials.

The ultimate effect of a large-scale program such as this one can perhaps best be measured in terms of its impact on the individual. The total impact of an expanded program in speech and hearing rehabilitation can be evaluated in terms of the individual and multiplied 8 million times to obtain the sum of the national effort:

The middle-aged survivor of a stroke who faces many months of patient

and enlightened professional care to overcome his aphasia;

The mother who hears the first sounds of speech from her deaf child; A group of young students receiving special instruction and experiencing new achievements as a result of new-found communications skills;

The industrial worker back on the job, able to do his job effectively and safely; and

The alert teenager who, short weeks ago, was labeled a delinquent until her surliness was traced to a congenital ear defect.

In years to come, I am confident that the record will show that favorable action by this subcommittee and the Congress on this legislation was not only an investment in an untapped reservoir of manpower but a priceless investment in human welfare as well.

Mr. Elliott. Has Mr. Loberfeld, Mr. Bristow or Mr. Bluestein arrived?

If not, our next witness will be Mr. J. F. Phelan, Jr., executive

director of the Children's Village, Inc.

Mr. Phelan, we have quite a number of witnesses. If you will summarize your statement, then the entire statement will be made a part of the record following your summary. If you can do that in 6 or 7 minutes, I will appreciate it, and that will give us a little time to ask questions.

You may proceed.

STATEMENT OF JOSEPH F. PHELAN, JR., EXECUTIVE DIRECTOR, THE CHILDREN'S VILLAGE, DOBBS FERRY, N.Y.

Mr. Phelan. Thank you, Mr. Chairman and members of the committee.

As the executive director of one of the oldest and largest treatment institutions in the country dealing with disturbed children who are both delinquent and predelinquent, I deem it a privilege to be per-

mitted to testify before this committee.

Essentially, the institution that I represent has had a great deal of experience in working with delinquent youngsters. There have been over 55,000 children who have gone through our program in the last 109 years. The institution has also made contributions to both the State and national organizations, particularly in the field of child welfare, and in the field of special education.

Our particular interest at the present time is in special education for disturbed and delinquent youngsters, and our experiences to date indicate that we need a great deal more help from the Federal Government and from the State governments, particularly in this area of

delinquency.

If I were to point out to you very, very briefly the efforts which are being made in this one particular program, I would summarize it by saying that most of the youngsters that we currently have in our program, 300 boys between the ages of 10 and 17, 90 percent of them have average intelligence and the mean age of all of these youngsters is 14 years.

Fifty percent of these delinquent and disturbed children are reading on a fifth-grade level or below, and 70 percent of these children are retarded in grade placement by 2 or more years. Sixty percent of the boys cannot achieve in arithmetic beyond the second-grade level.

This gives you some of the characteristics of the youngsters we are working with. Our problem at the present time, and it is no different in this organization or in other agencies dealing with the problem of disturbed children, is the absence of trained teachers who are capable and able to work with the kinds of problems which these children present.

Most of my comments on the experience of our agency are incorporated in my statement. However, I would like to make my recommendations to the members of the committee based on the experience of the Children's Village and other agencies engaged in this field.

First of all, we would like to recommend that provisions be made by the Federal Government to provide grant-in-aid to institutions of higher education and private training centers to provide specialized training programs for capable teachers, supplemented by on-the-job training in order to prepare qualified personnel to teach disturbed children.

Such grants-in-aid should be a joint undertaking, with the U.S. Department of Health, Education, and Welfare, and under the super-

vision and control of the Children's Bureau.

Second, we would like to recommend that research moneys be provided by the Federal Government, perhaps on a matching basis, to those States willing to study the problems of this area of education. These moneys should be administered on the State level to those insti-

tutions, agencies, and school districts capable of establishing demon-

stration and research projects in this field.

Third, we would like to recommend that the term "special education" be expanded to include "emotionally handicapped child" in its eligible categories so that any Federal assistance which would include not only physically handicapped and mentally retarded would bring about an impact on other areas of exceptional children.

Fourth, we would like to recommend that the Federal Government, through the Department of Health, Education, and Welfare, undertake a study of existing Federal legislation regarding child labor regulations and establish criteria for the employment of these children under certain conditions and when certified by public agencies.

One of the problems that we have at the present time in placing some of these disturbed and delinquent children back in the community is the already existing child labor legislation, which is aimed at protecting the average child but does not really meet the needs of the disturbed and delinquent youngster. This would serve as a guide to State legislatures throughout the country.

Fifth, we would like to recommend that provisions be made to grant Federal assistance to States on a matching basis for the development of more adequate programs of trade preparation and vocational training for special education categories of youngsters leaving institutions

and schools for employment in the community.

This would include federally sponsored programs of vocational rehabilitation, which should be open to emotionally disturbed adolescents. I think the experience of the Children's Village and throughout the country has indicated that there is a terrific waste of manpower with these youngsters who could very certainly be involved in gainful employment.

Sixth, provision should be made for the allocation of Federal funds to the various States for the purpose of establishing research and demonstration projects aimed at early detection and diagnosis of

problem children involving special facilities.

One final recommendation we would like to make includes development of criteria for teachers of disturbed and delinquent children. This criteria is already incorporated in the prepared statement.

Mr. Chairman, I hope I have summarized as briefly as possible.
Mr. Elliott. You have cooperated very beautifully and I thank
you.

The Chairman recognizes the gentleman from New Jersey for a

question.

Mr. Daniels. Mr. Phelan, in your study of this problem, are there sufficient institutions, colleges, universities, in existence in our country for the training of the necessary personnel for the disturbed and

handicapped children?

Mr. Phelan. Yes, sir. I feel that we have sufficient institutions of higher education throughout the country that could develop curriculum training for specialized teachers of disturbed children. In addition, we have not too many, but we have some training centers, treatment centers, for disturbed children where teachers could have the kind of on-the-job experience in working with these youngsters.

Mr. Daniels. You say we have. Do you know how many of these schools or colleges have undertaken to train personnel at the present

time and how many are in attendance?

Mr. Phelan. At the present time, I would be unable to state the exact number, but in New York City we do have special education programs in some of our universities, in which graduate students

are involved in studying the problems of disturbed children.

The problem, however, in the educational field, is that there is at the present time no specified curriculum of training for such graduate students. I think the recommendations that we are making here include a recommended criteria for such curriculum based on the experience of working with these disturbed youngsters.

Mr. Daniels. Thank you. Mr. Elliott. Mr. Giaimo of Connecticut.

Mr. Giaimo. You speak of disturbed and delinquent children. Are you restricting your definition of disturbed to include an element of

delinquency in it?

Mr. Phelan. My statement is based on the fact that legally the classification of delinquent is determined by an adjudication in a court. From a treatment standpoint, we see no difference, in my own experience, between a disturbed child and a delinquent child. He is equally disturbed.

Mr. Giaimo. But I was wondering in your recommendations for this particular group of children whether you were speaking primarily of those groups which have an element of delinquency, or the entire field of emotionally disturbed children, whether or not there

exist delinquent motivations.

Mr. Phelan. I was referring to the entire field of emotionally disturbed children, emotionally handicapped children.

Mr. Giaimo. Thank you.

Mr. Elliott. Thank you very much, Mr. Phelan.

(Mr. Phelan's complete statement follows:)

STATEMENT BY JOSEPH F. PHELAN, JR., EXECUTIVE DIRECTOR, THE CHILDREN'S VILLAGE, DOBBS FERRY, N.Y.

Mr. Chairman and members of the committee, as the executive director of one of the oldest and largest treatment institutions in the country dealing with disturbed children who are delinquent or predelinquent, I deem it a privilege to be permitted to testify before this committee. The Children's Village has been in existence for 109 years, and during this time has exercised leadership in the child welfare and educational fields by providing care for over 55,000 boys between the ages of 10 and 17 years, in training professional staffs, and in conducting basic research in children's problems. Through its membership in national and State organizations, it has shared its experiences, contributing to the better understandings of the nature, treatment, and education of disturbed children. Within the past 3 years efforts have been made to reevaluate the special educational needs of its youngsters and to assess their experiences after they are returned to their home communities. A study in 1956 indicated that 78 percent of the boys who returned to public schools were making a satisfactory adjustment. Approximately 75 percent of the youngsters under care come from New York City, while the remaining 25 percent of the youngsters are sent to us from other counties in New York State, as well as seven surrounding States.

EXPERIENCE OF EDUCATIONAL PROGRAM

Because of the character and nature of the population served at the Children's Village, the problems of education take on a special significance for purposes of this committee. Out of a current population of 300 boys, varying in age from 10 to 17, 90 percent of them have average intelligence, and the mean age is 14 years, but 50 percent read on a fifth-grade level or below; 70 percent are retarded in grade placement by 2 or more years; 60 percent of the boys cannot achieve in arithmetic beyond the second grade level. Most have chronic truant records and have been expelled from community schools. The history of our children is characterized by the absence of any sound familial experience. attitude they have toward adults is often hostile, apprehensive, distrustful, and sometimes contemptible. It is apparent to us that a special education program must be geared around the adults who work with these children, who must not only be thoroughly trained in educational techniques, but must possess under standing of psychosocial factors and their implication for educational progress. Those adults must be free from the need for retaliation, have the resiliency to bounce back from trying experiences, be resourceful, and perhaps most important: they must be fascinated by these children and the challenge they Experience indicates that the educational needs of these children require intensive planning on an individual basis. Clinical study and research have taught us that a variety of factors contribute to the learning difficulties of disturbed children, and that the approach to these problems cannot be left to the classroom teacher alone. For example, we have been somewhat successful in marshaling a staff of trained specialists to work with these youngsters on a team basis. In addition to the trained staff of 33 certified teachers, there are available a paid staff of 249 people, including psychiatrists, psychologists, trained social workers, recreation specialists, child-care personnel, chaplains, and medical personnel, along with a corps of 300 volunteers assisting the teachers to carry out their basic functions of educating these youngsters. We have further learned that the techniques and skills required in working with disturbed children may vary considerably from the usual methods employed in community schools. A principal condition for any educational program is the pupil's motivation and desire to learn. With most of our youngsters, this ingredient is conspicuous by its absence. Subject matter and curriculum for these youngsters may be entirely dependent upon the appropriateness of the relationship which the teacher is able to establish with individual children and the climate created for the group in the classroom.

Our experience further indicates that the problems of management and supervision of a classroom is directly affected by the quality of these relationships. In a sense, this is no different than the experience with so-called average children in community schools. The difference, however, rests in the fact that most teachers can sensitively and intuitively respond appropriately to most children; that most adults can understand the motivation of most children without specialized study; that the spontaneous response of most adults to most children is right and respectful of their needs; that most schoolchildren have matured sufficiently so that they may be members of a class group. All children need understanding, and most can be understood by the normal well-intentioned adults. This is not the experience with our boys, and for that reason the clinical professions are needed to study the child, not only for clinical treatment but to bring understanding to teachers so that they may relate to these children in a manner which facilitates learning to occur, which enables the healthy aspiration which is not entwined by the emotional disturbance to function and to achieve. This has implication for the training of teachers and for

the administration of the educational program.

Classroom sizes at the Children's Village average 12 youngsters, with some classes as small as 7 and others as large as 18 boys. Other aspects of the Village's special education program make provision for trained educational supervisors who are available to assist and support members of the teaching staff in their daily classroom activities. These supervisors provide a basic ingredient in supporting the classroom teacher and helping her to arrive at not only an educational diagnosis of the youngster's needs but an assessment of the youngster's total personality which is essential and critical in developing motivation for learning with disturbed children. Aside from the school principal and two educational supervisors, we have a plan to expand this to four supervisors next year, a ratio of one supervisor to every six or seven teachers.

There is no existing official field of special education with recognizable training, standards, licensing for teachers of the emotionally disturbed. Recruitment of staff is, therefore, a more severe problem than for the fields which have some tradition and recognition. Whatever training is provided comes from in-service supervision, seminars, and workshops. There is a need to establish the existence of feaching the motionally disturbed as a profession in education. I am most pleased that this committee has made provision for spokesmen working with disturbed children to share their experiences.

Along with the study of the academic program in our agency has been an evaluation of the prevocational needs of these children in preparing them for

community employment. Our experience in placing of the older boy, between 16 and 17 years of age, in employment upon his return to the community has not been consistent with his educational growth in the Village. During the past year (1958-59), 39 boys were placed in jobs in New York City. This was the result of the efforts of a trained specialist on our staff who works as a job placement and guidance counselor with boys leaving the institution. The problem of job placement has always been a difficult one from two standpoints. First, the reluctance of employers to take on an institutional youngster in gainful employment. Secondly, the process of preparing a youngster while in the institution for a particular trade placement is hampered by child-labor legislation aimed at protecting the average normal child, but not suited to the employment needs of children who fit into the category of delinquent and disturbed children with determined potential for learning and production. Union regulations regarding age in many situations prevent adolescents from developing apprenticeships and training. Unfortunately, too few employers have recognized the value of vocational on-the-job training, and many consider this to be a waste of time since the youngsters are subject to military service. They fail to recognize the potential of these youngsters to continue their trade training while in the service and to provide a resource of manpower to the employer upon his discharge.

CONCLUSIONS AND RECOMMENDATIONS

In consideration of the foregoing, as well as the task of this subcommittee, we would like to present the following proposals based on the experience of the Children's Village in the field of special education for disturbed children:

1. Provisions should be made by the Federal Government to provide grants-in-aid to institutions of higher education and private training centers, to provide specialized training programs for capable teachers, supplemented by on-the-job training in order to prepare qualified personnel to teach disturbed children. Such grants-in-aid should be a joint undertaking with the U.S. Department of Health, Education, and Welfare and under the supervision and control of the Children's Bureau.

2. Research moneys should be provided by the Federal Government, perhaps on a matching basis to those States willing to study the problems of this area of education. These moneys should be administered on the State level to those institutions, agencies, and school districts capable of

establishing demonstration and research projects in this field.

3. The term "special education" should be expanded to include the "emotionally handicapped child" in its eligible categories so that any Federal assistance would include not only the physically handicapped and mentally retarded, but bring about an impact on other areas of exceptional children.

4. The Federal Government, through the Department of Health, Education, and Welfare, should undertake a study of existing Federal legislation regarding child-labor regulations and establish criteria for employment of these children under certain conditions and when certified by a public agency. This would serve as a guide to State legislatures. Contracts of financial assistance should be established to the effect that Federal appropriations for assistance would be contingent on meeting the definitions of this legislation.

5. Provisions should be made to grant Federal assistance to States on a matching basis for the development of more adequate programs of trade preparation and vocational training for special education categories of youngsters leaving institutions and schools for employment in the community. This would includes federally sponsored programs of vocational rehabilitation which should be open to emotionally disturbed adolescents.

6. Provisions should be made for the allocations of Federal funds to the various States for the purposes of establishing research and demonstration projects aimed at early detection and diagnosis of problem children requir-

ing special education facilities.

The predominant needs as experienced by the Children's Village and other agencies involved in this problem is the acute shortage of qualified teachers, the lack of interest on the part of the public with the needs of children falling within this category, and, more precisely, the absence of a specified curriculum of training for such personnel. As an additional recommendation, we would suggest the establishment of a pilot project, perhaps under the direction of the Department of Health, Education, and Welfare and assisted by the National

Education Association to be conducted in a few of our institutions of higher education. Such a curriculum of training might include the following subject matter supplemented by field work experience at a recognized school or institution involved in the problems of special education:

Psychiatric concepts about human behavior;

2. Psychological understandings of learning disabilities and their relationship to emotional problems;

3. Group work concepts concerning the dynamics of group and peer leadership;

4. An understanding of the functions of community facilities available

for disturbed and delinquent children;

5. Training in the use of concrete and creative nonverbal media, such as

crafts, arts, music, visual aids, dramatics, etc.;

6. A 1-year educational field placement under supervision in a recognized treatment center for disturbed children. For supervisors and administrators additional courses in the process of supervision should be provided, based on experiences in those schools which conduct pilot educational programs

for disturbed children.

The problems of special education for disturbed and delinquent children present complex and challenging tasks. Techniques and developments in the field of education have not kept pace with this growing problem. Unless the Federal Government and others interested in education provide adequately for these youngsters now, they will become the occupants of prisons and State hospitals tomorrow.

Mr. Elliott. Our next witness is Dr. R. H. Manheimer, medical director, Arthritis & Rheumatism Foundation, Inc.

Do you have a written statement?

STATEMENT OF DR. R. H. MANHEIMER, MEDICAL DIRECTOR, ARTHRITIS & RHEUMATISM FOUNDATION, INC.

Dr. Manheimer. Yes; I do.

Mr. Elliott. Will you summarize it, please, in about 6 or 7 minutes and let us ask you questions?

Dr. Manheimer. Yes, Mr. Chairman.

Mr. Chairman, I am honored to appear here today, and hope that my statement will be useful to the Subcommittee on Special Education.

I shall confine my remarks to two aspects of the rehabilitation of arthritis patients, vocational rehabilitation and the rehabilitation of the homebound.

Arthritis, as you know, is a widespread chronic disease which often disables and cripples. It affects 10 million Americans, with more than 32,000 otherwise able persons rendered unemployable for an en-

tire year by arthritis and other rheumatic diseases.

The need for vocational rehabilitation, therefore, is evident. continue earning, many disabled arthritics must change the kind of This requires skilled help, particularly for the patient work they do. who is 40 or older. Each year we estimate it costs \$125 million in taxes to provide subsistence allowances for arthritics who cannot work.

To get as many of these men and women back to work as possible, therefore, makes good sense. We believe that the subcommittee should be prepared to encourage vocational rehabilitation activities in

view of the results obtained by recent programs.

For 6 years the New York Chapter of the Arthritis & Rheumatism Foundation has been providing vocational rehabilitation for unemployed arthritis victims. This back-to-work program is run jointly by the foundation and the Institute for the Crippled and Disabled, one of the country's leading rehabilitation centers.

Each year 40 percent of the patients who enter this program do go back to work. They get jobs in regular business and industry, working side by side with nonhandicapped employees. To date, 200 men and women, some of whom had been out of work for 20 years because of disabling arthritis, have jobs which they perform efficiently despite

their arthritis and without injury to their health.

To find out whether these handicapped people could sustain employment, we got in touch with 99 who had been placed on jobs at least 6 months earlier. Sixty-nine percent of these 99 persons were still working. Many had gotten wage increases; some had been working for over 2 years since their vocational rehabilitation. Not all these people gave us full information about their earnings, but 28 reported wages since they went back to work which totaled, over the 3-year period, \$79,000, more than twice what the project had cost the Arthritis Foundation up to that time.

Instead of subsisting on welfare, these men and women have become taxpayers and were contributing to the cost of running their city and country. We therefore believe that vocational rehabilitation of the unemployed arthritic is practical, realistic, and good economics.

The money spent brings concrete returns. It appeared necessary to demonstrate that not only can vocational rehabilitation for arthritics be provided in a large center like New York, but that effective services can also be devised for our widespread and growing subur-

ban communities.

The Arthritis & Rheumatism Foundation, with the cooperation of the Long Island Jewish Hospital, and a generous 3-year grant from the Office of Vocational Rehabilitation, recently started a vocational program on Long Island to serve not only arthritis patients, but all community residents with orthopedic handicaps which now keep them from working.

This new program, unlike the back-to-work project, does not depend on the existence of a large, specialized rehabilitation center. Rather, it is located in and uses the resources of a good general hospital, such as many communities throughout the Nation also have.

Although the project is barely a year old, it also presents good evidence that a community's hospital facilities are well adapted to providing the varied services required in vocational rehabilitation. Already a number of patients have been retrained and placed on appropriate jobs in their home communities, and the number of patients coming to the project for help has been significantly larger than our original estimate.

Mr. Elliott. Dr. Manheimer, let me ask you this question: Has much progress been made in eradicating the pain from arthritis? Do the people that you speak of who are rehabilitated sufficiently to go back to their jobs remain free of pain as they go back to work? Have

we gotten that far yet?

Dr. Manheimer. They are reasonably free. Those who have a great deal of pain are not in condition to go back to work. Most of the patients whom we deal with, actually, are under medical treatment and require constant medical treatment. Yet they are able to get back to work. This has been our experience.

In most cases they have had to had some changes in their previous experience with work. They have had to learn a new kind of job.

At times it only had to be to modification of their previous job.

For about 50 percent of those we got back to work, they had to learn a new trade altogether. The opportunities of developing a vocational rehabilitation center that can train and test these people in new jobs that they didn't consider that they had any capacity for or didn't have any comprehension about is what makes this kind of a program desirable and practicable.

Mr. Elliott. Is cortisone still one of the main medications?

Dr. Manheimer. Cortisone, as such, is really rarely used today, but many advances have been made in cortisone derivatives so that there are now many drugs which are much less toxic than cortisone and

which are really useful.

That doesn't mean that every doctor must not be aware of the cautions in using the drug. There is not a journal of rheumatic diseases that does not come out emphasizing the dangers inherent in this drug. But really, I believe it, as with many drugs, has a very useful place.

In our experience, we find that at least an important percentage of the patients who go back to work are able to go back to work, in part, at least, because they are on drugs such as the cortisone and its

derivatives.

Mr. Elliott. Thank you.

Dr. Manheimer. We are convinced that programs like this one can and should be encouraged throughout the United States so that patients afflicted with arthritis and other handicapping conditions may

return to self-respect and self-support.

In analyzing how such metropolitan and suburban programs may be developed throughout our country, it would appear that Federal support would be of material help. I would like to touch on this and on how such help would be most useful in just a moment. Meantime, there is another group of arthritics equally in need of help. These are the men and women who are confined to their chairs or beds by their rheumatic disease.

A measure of the scale of this problem is the fact that of all the beneficiaries under the Federal program of aid to the permanently and totally disabled, one-tenth require such aid because of arthritis.

In 1956, 258,279 persons in the United States were receiving such aid. No one knows how many other arthritics not receiving care under the APTD are, nevertheless, confined to bed or chair, nor how many family members who would otherwise be able to earn must stay

at home all day to care for them.

It has been the experience of the Arthritis Foundation that the homebound arthritic can also be helped significantly. To reach the homebound arthritic, the Arthritis and Rheumatism Foundation turned to the visiting and public health nurses who are already going into the homes of many patients too handicapped to get to doctors' offices or to clinics.

We submit that the visiting-nurse organizations are ripe and eager to assume some of the responsibility for making homebound patients more self-sufficient, more capable of the ordinary activities of every-day life. With appropriate help and encouragement, the visiting nurses are in an ideal position to do this. As evidence of what can be done, I offer the Arthritis Foundation's 3-year experience in cooperation with the District Nursing Association and the Westchester

Public Health Department. To their joint nursing staffs we added a full-time physical therapist and regular consultations with the physi-

cians specializing in rehabilitation.

This cooperative program cared for over 120 patients. Some were bedfast, some chairbound. Others could walk, but were limited in other ways, in washing themselves or doing simple household activities. On careful analysis of the 120 case records, we found that 80 patients had improved significantly in their capacity to perform ordinary everyday activities.

This 66-percent improvement is all the more striking when I add that most of these patients were at least 60 years old and many had two or more serious diseases. Some of these 80 patients learned how to wash and dress, to shift from bed to chair, or to feed themselves without the help of another person. Some began to go out of doors or to do light household chores. In a few cases the improvement was such that a family member could go to work, thus improving the family's economic situation.

The cost per patient was about \$99, which seemed reasonable. How can the Federal Government aid in developing effective programs of home and vocational rehabilitation programs throughout this country? Two aspects of the programs I have described merit special

consideration by your subcommittee:

First, both programs use existing—and I repeat, existing—highly skilled agencies to develop new rehabilitation services to meet urgent, unmet needs. Thus, the organization of our programs were simple,

their operation flexible, and their costs moderate.

In considering ways and means of improving our Nation's rehabilitation services, I suggest that the subcommittee consider the value of adapting and expanding existing agencies, already well established in their communities and, as evidenced by our experience, eager to develop

new ways of serving their local communities.

Second, the vital element in both home and vocational rehabilitation proved to be the highly skilled professional workers who did the work. In vocational rehabilitation our success depended in overwhelming measure on the well-trained vocational counselor. Inherent in such personnel is the developed capacity to utilize all the resources at their command, to fully evaluate the patient's limitations and needs, to develop the residual resources, to determine the exact demand of the jobs locally available, to plan training programs suitable to the patient's capacities and the community's job resources, and to carry through until the patient is actually placed at work.

In home rehabilitation, the essential factor was the physical therapist. His skill in evaluating the extent of the patient's handicap and of his residual resources, in devising self-help devices and training the nurses to plan an appropriate role in the whole enterprise,

these qualities were the heart of the program.

Well trained personnel for vocational and home rehabilitation are exceedingly scarce. Time and again arthritis programs have been delayed for months because competent personnel to staff them could not be found. The growing activity in all areas of rehabilitation, welcome though it is, places a demand for personnel on the training schools which they have been unable to meet.

If this country is to meet the need for rehabilitation, if it is to encourage home rehabilitation through the visiting nurses, if it is to stimulate the development of vocational rehabilitation in suburban communities, we must produce more well trained physical therapists and vocational counselors. Only thus can we help these agencies to broaden their responsibilities to meet the needs of these changing times.

In conclusion, although I have reported to you on the experiences confined to New York City, Long Island, and Westchester, I believe that the needs of our arthritis patients here, the methods devised for meeting these needs, and the problems encountered, are representative of the needs, methods, and problems facing all the agencies throughout this country, which are trying to maintain in 10 million American arthritics the maximum capacity for motion, self-care and selfsupport.

Mr. Еглотт. Thank you, Dr. Manheimer.

The gentleman from New York, Mr. Lindsay, has a question he would like to ask.

Mr. Lindsay. Dr. Manheimer, how much money is raised nationally

by the foundation?

Dr. Manheimer. I am familiar with the chapter organization, and I am not quite sure about the national. I believe it is over \$1 million, about \$11/2 million.

Mr. Lindsay. What is the chapter's?

Dr. Manheimer. The chapter's range is between \$500,000 and \$600,000. We have our own local program of about \$200,000, and 40 percent of our fund is committed to the national for their program, which is basically laboratory research.

Mr. Lindsay. Does the State of New York give you any direct as-

sistance earmarked for arthritis?

Dr. Manheimer. No.

Mr. Lindsay. Thank you. Mr. Elliott. Thank you very much, Dr. Manheimer. Your statement will be very helpful to the subcommittee.

Has Mr. Loberfeld arrived? Has Mr. Bristow arrived? Is Mr. Bluestein present?

Is Mr. George J. Hecht, of the American Parents Committee present?

You are Dr. Clarence D. O'Connor, superintendent of the Lexing-

ton School for the Deaf; is that correct?

Mr. O'CONNOR. That is correct.

Mr. Elliott. Mr. O'Connor, if you will, summarize your statement in about 6 or 7 minutes. Your full statement will be made a part of the record immediately following your oral presentation.

STATEMENT OF CLARENCE D. O'CONNOR, SUPERINTENDENT, LEXINGTON SCHOOL FOR THE DEAF, NEW YORK CITY

Mr. O'Connor. This is a statement from Mr. George J. Hecht, who was also asked to be a witness, publisher of Parents magazine, and chairman of the American Parents Committee, Inc.

Mr. Elliott and members of the committee, the American Parents Committee, which, as you know, is an organization which works for Federal legislation for

the health, education, and welfare of the Nation's children. We are very interested in the bills before you which would stimulate and help secure specially trained teachers for the deaf and specially trained speech pathologists and audiologists for those children who suffer speech and hearing impairment. The bills which we support are the ones introduced by you, Mr. Elliott, House Joint Resolution 494 and its counterpart, House Joint Resolution 488 introduced by

As the witness for the American Parents Committee, I would like to present Dr. Clarence O. Connor, who is an expert in the field. Dr. O'Connor is superintendent of the Lexington School for the Deaf in New York City. He has had over three decades of experience in teaching deaf children and has engaged in active research in classroom hearing aids to facilitate such teaching. I am sure

Dr. O'Connor will be a valuable witness to your committee.

Mr. Elliott. We are glad to have you, Mr. O'Connor, and I am sure

you are an expert in your field. You may proceed.

Mr. O'Connor. Mr. Elliott and members of the committee: What I have to say today is being said on behalf of Mr. George J. Hecht and the American Parents Committee, Inc., of which he is chairman, and on my own behalf as one who has been concerned with the welfare and education of the deaf for 30 years.

In addition, although I have not been requested to speak for these groups, I am confident that what I say essentially expresses the views of the following organizations working in the interests of the deaf:

The Conference of Executives of American Schools for the Deaf; the Alexander Graham Bell Association for the Deaf, of which I was president for 12 years; the Convention of American Instructors of the Deaf; the New York State Association of Educators of the Deaf; and the National Association of the Deaf.

Those for whom I speak strongly support the bill you have introduced, Mr. Elliott, House Joint Resolution 494 and its counterparts, House Joint Resolutions 488, 503, 507, 512, 516, and 526 introduced, respectively, by Congressmen Fogarty, Boland, Thornberry, Loser, Baker, and Moorhead.

These bills would provide grants-in-aid to training centers which would enable them to recruit and train professional workers for the presently seriously understaffed area of special education, the speech

handicapped or impaired, and hearing impaired.

The degree of effectiveness with which one is able to communicate with one's fellow man has a profound influence on one's whole social The reduction of the severity of a speech handicap and economic life. through expert therapy, the acquisition of skill in lipreading by one who is hard of hearing, or the miracle of learning to speak by one born deaf who, because he cannot hear, would never learn to speak unless specially taught, makes it possible for those so helped to meet more equably the challenge of our competitive society, and broadens the base of their contribution as citizens.

There are millions of American children with varying degrees of speech and hearing difficulties who need the services of specially trained people to help them reach this higher level of performance. Many of these are denied this help because of the very serious shortage

of trained workers in this field.

Grants-in-aid would be a powerful recruitment boost in interesting young people to enter this special field. The main factor that keeps them out is money, for special training programs are frequently superimposed on a 4-year college course. This means an extra and uncontemplated year of expense, so the easy alternative is to enter the regular teaching field immediately after graduation.

An example of this is our experience at the Lexington School for the Deaf. We provide a teacher preparation program on the graduate level in conjunction with Teachers College, Columbia University.

For the academic year 1959-60, we received inquiries from at least 50 or 60 interested young men and women, most of whom were in their senior year in college. At least 10 and undoubtedly many more were forced to give up the idea of special training in the field of the deaf in the face of the necessity of finding up to \$2,000 to cover expenses for the year.

We could have undoubtedly had a group of 40 or 50 trainees if grants-in-aid or scholarships were at hand. Instead, we are training only 12. Some of these 12 are here, and you cannot tell from looking at them, but they have mortgaged their next several years, through

borrowing, to take this special training.

Title I of House Joint Resolution 494 provides for assisting educational centers in preparing teachers of the deaf. It is generally conceded by educators dealing with all types of exceptional children that there is a more critical teacher shortage in the area of the deaf than any other field of exceptionality. A few statistics will confirm this.

In June of 1959, only 127 teachers of the deaf were graduated from the educational centers in the United States offering teacher preparation programs in this field. Over 500 were needed to supply the requirements of more than 300 school facilities in the country providing

programs for deaf children.

This imbalance has prevailed for years so the cumulative effect of this is almost catastrophic. In many schools, particularly in those sections of the country with traditionally low salary schedules, educational services must, of necessity, therefore, be provided by large numbers of sincere but untrained teachers, except for what inservice training can be provided by an already overworked staff.

It is possible that in some schools as many as 75 percent of the staff might fall in this category. Financial assistance would definitely improve this most undesirable condition, and would undoubtedly make possible the establishment of regional training centers in different sections of the country which could more effectively meet the needs

of each particular area.

Accompanying my statement is a bulletin published by the American Annals of the Deaf, giving detailed statistics concerning the great

teacher shortage that exists in the area of the deaf.

Title II of House Joint Resolution 494 provides for financial assistance in preparing speech pathologists and audiologists. The early detection of hearing impairment is vastly important for two reasons. First, the hearing loss in many cases is reversible if discovered early enough. Second, if it is not reversible, proper educational treatment can then be provided at an early age and accordingly greater educational gains are possible.

The audiologist is the key member of the team in this process of early detection. Many more are needed than are now being trained. There are millions of children and adults in our land with speech handicaps. Some of these handicaps are the result of mild or moderate hearing impairment—these are the hard of hearing as contrasted with

the deaf. Others are caused by neurological or physical disorders. Only trained speech pathologists can properly serve this vast group. A serious shortage of trained personnel exists in this field of excep-

tionality.

In connection with title II, I should like to point out to the committee that probably the majority of these millions with speech handicaps are children. Accordingly, possibly the responsibility for this area of personnel training should be placed in the U.S. Office of Education rather than the Office of Vocational Rehabilitation.

I wish to thank the committee for giving me this opportunity to bring to your attention the critical nature of the shortage of trained personnel in the field of the speech handicapped and hearing impaired, and express the hope that our combined efforts to relieve this

condition will be successful.

Mr. Elliott. The Chair recognizes the gentleman from New Jersey. Mr. Daniels. Dr. O'Connor, how many children would you esti-

mate are in the United States who are totally deaf?

Mr. O'Connor. Attending schools for the deaf and the programs that I mentioned, over 300 programs, there would be 24,000 or 25,000 approximately, and in the whole United States, children between the school ages of 5 to 18, perhaps, we might calculate that there would be as many as 40,000 to 50,000 really deaf children, severely deaf.

Mr. Daniels. Are there any children that do not attend school? Mr. O'Connor. Some of these youngsters attend schools for the

normally hearing, are integrated with them.

Mr. Daniels. How many of them do you think suffer from speech

defects, requiring training from specialized personnel?

Mr. O'Connor. In the speech field, I am not as familiar with that field, but I think the figure used for all speech handicaps is 6 million, and this is the range of from 3 to those over 65. Within the speech area, this is the calculation; there would be several million that have speech defects.

Mr. Daniels. How many accredited institutions are there in the

United States for the teaching of personnel for the deaf?

Mr. O'CONNOR. Training the teachers of the deaf? I think we count 22.

Mr. Daniels. Do you know where they are located?

Mr. O'CONNOR. They are located throughout the United States. I think they are listed in the pamphlet which has been submitted.

No, I am not sure that they are.

Mr. Daniels. Could you obtain a list for the committee and furnish that to the committee in the next few days?

Mr. O'Connor. I will be glad to.

Mr. Daniels. Do you know how many teachers there are in training at the present time?

Mr. O'Connor. Something in the neighborhood of 150 or 160. It

is a little more this year than it was last year.

Mr. Daniels. How many teachers would you estimate would be necessary in order to take care of our present needs and requirements?

Mr. O'Connor. Properly to take care of them, we should train 500 a year at least, to fill in at least the backlog of this accumulation of untrained personnel.

Mr. Daniels. What do you estimate to be the shortage of teaching

personnel for the deaf and the speech handicapped?

Mr. O'Connor. The speech I will have to pass to the experts in the speech field. In the field of the deaf particularly—although I know the figures they are using, they feel they should train 1,500 speech pathologists and audiologists per year, in order to catch up on the services not being rendered properly; in the area of the deaf, it is estimated that 500 a year will meet the current needs.
Mr. Daniels. In what period of time?

Mr. O'Connor. 500 a year.

Mr. Daniels. For how many years?

Mr. O'Connor. This would be a figure that would go on indefinitely. The replacement factor is this number.

Mr. Daniels. If I understand your testimony correctly, there is a

great shortage at the present time.

Mr. O'CONNOR. That is correct.

Mr. Daniels. What do you estimate the shortage to be, so that the committee can formulate some opinion as to what the need may be and appropriate the necessary sum of money if we feel it should be done?

Mr. O'CONNOR. The difference between those fully trained and those needed to be fully trained is about 350. This means about 150 are being prepared, but we need 500. This would mean that 350, a differential of that number, each year, would be necessary to meet the ongoing needs. Multiply this by any number of years.

Of course, this does not provide for the replacement of those that I

spoke of that are operating and untrained.

Mr. Daniels. Thank you, Doctor. Mr. Elliott. Mr. Giaimo? Mr. Giaimo. No questions. Mr. Elliott. Mr. Lafore? Mr. Lafore. No questions. Mr. Elliott. Mr. Lindsay?

Mr. Lindsay. It is a pleasure to listen to Dr. O'Connor's testimony.

He is really one of the experts and leaders in this field.

I should like to say that if the members of this subcommittee have any time at all in their crowded schedule, I am sure Dr. O'Connor would be pleased to show the facilities and the things that they are doing in the school that he heads up, the Lexington School for the Deaf.

Mr. O'Connor. I will be very happy to, indeed, any time. have our teacher training program there, and you can see what is required of young people to meet this challenge of a year's graduate

study to become teachers of the deaf, and why.

Mr. Elliott. How many teachers are you training at your school this year?

Mr. O'Connor. Twelve this year.

Mr. Elliott. Are these young ladies part of the class [indicating a group attending hearing]?

Mr. O'CONNOR. These young ladies, and Father John, himself.

Mr. Elliott. Where is your school located? Mr. O'Connor. 68th and Lexington, New York.

Mr. Elliott. Thank you very much. We have heard you with a great deal of interest. What you have said is very helpful, Dr. O'Connor.

Mr. O'CONNOR. Thank you.

Mr. Elliott. May I say that the subcommittee is very happy to have with it this morning the chairman of the full Committee on Education and Labor of the U.S. House of Representatives, the Honorable Graham A. Barden, of North Carolina.

We are indeed happy to have you, Mr. Barden, and trust that you

will enjoy our hearing here in New York City. Would you care to say anything at this time?

Chairman Barden. Not at this point, Mr. Chairman.

Mr. Elliott. Our next witness is Mr. William J. Rosengarten, director of special services, Roslyn Public Schools.

Mr. Rosengarten, will you summarize your testimony and leave the written statement with the reporter?

Mr. Rosengarten. Yes, Mr. Chairman.

Mr. Elliott. You may proceed.

STATEMENT OF WILLIAM J. ROSENGARTEN, DIRECTOR, SPECIAL SERVICES, ROSLYN PUBLIC SCHOOLS

Mr. Rosengarten. Mr. Chairman and gentlemen, I come here not as an expert. I know that there are experts available. I come here as an educator on the local level who is facing this problem of finding proper educational placement for youngsters of various disabil-

I am particularly anxious this morning to relate a little about the plight, if I may use the word, of a fellow like me when he is faced with a problem of placing a youngster who is labeled by the general term "emotionally disturbed" or even "brain injured."

No one has cared to define that exactly, and I am not interested, really, in the definition nor the therapy, nor the ideology, or whatever it is that the M.D.'s and other doctors do along the lines of therapy and that kind of aid. I am interested in education, the problem of educating children who come to us with these symptoms, which can be

described in various medical and educational terms.

The emotionally disturbed child, who cannot benefit from education that is provided in the public schools, and when I say public schools I am referring to my own limited bailiwick—Roslyn is a relatively small suburban community on Long Island whose citizens do try, to the best of their ability, to meet the educational needs of all the youngsters, including the handicapped—the problem of the emotionally disturbed has been taken up somewhat this year by the Vocational Education and Extension Board of Nassau County, under the auspices of the State education department, in a limited way to make a start.

I have heard other witnesses plead for the training of teachers, and the development of research projects that may help. On the local level, however, I feel that the greatest benefit can come from research carried on at the local level, where the teaching needs to be done, rather than in the university classroom or laboratory classroom that can be set up in limited quantities here and there in the country.

If the Federal Government could help the States through financial aid and any other matter, by providing expert advice to offset the costs of setting up small experimental groups in the various communities where such children reside, I think we could develop some kind of

program for the emotionally disturbed or the brain injured which would result in their education, their gaining of knowledge, perhaps their ability to handle themselves in the so-called normal world.

I feel a little bit disturbed when we have to exempt youngsters from public education because they cannot benefit from what we have. While legally this exempts us from certain responsibility, I do not feel exempted morally and I would like to see something further done if

we can assume this responsibility.
So my plea, then, is just one: That the Federal Government, if it can, assist the State with special moneys earmarked for experimentation on the local level in the area of the emotionally disturbed or brain injured who would ordinarly be excluded from normal public education.

Thank you.

Mr. Elliott. Are there any questions of this witness?

The Chair recognizes the gentleman from North Carolina. Chairman Barden. Would you go just a little further and describe

the kind of setup you would want in your local community?

Mr. Rosengarten. If it were possible, through the efforts of the experts, to identify a number of children who could be placed or put together as a group, rather than as a 1-to-1 therapist-patient setupwell, a group can be defined as more than one, anywhere from 2 to 5

to 10, I don't know, but I presume it would be small.

The effort made in Nassau County now is in one section a group of 5 and in other communities it gets as large as 12 or 15. If this group of children could be brought together within the age limits of compatibility as well as the compatibility of symptoms so that a teacher could work with these youngsters, regardless of what we label them. to educate them in whatever way they can benefit, whether the teacher can be provided with special methods, special curricular objectives, material, and equipment, if all this could be worked on at the local level, then I think we would have the kind of group or setup which might make a start, at least, in handling this program.

Chairman Barden. May I follow that by asking: Would you have that teacher with special qualifications or is that a type of mutual education, she learning the habits, the ways, and so forth of these children,

and working from a practical point of view?

Mr. Rosengarten. You sound as if you are an educator, too, because teachers always learn from their children, and education is mutual. It would certainly be mutual in this regard because the teacher at this time is not truly an expert, because with all the help of the other agencies that have testified here, and I am sure that will follow, it makes a difference when you are right in with the youngsters trying to accomplish something with them, to alter their behavior, to reach some educational objectives which you can see and observe, and measure in a youngster's achievement or accomplishment.

So this teacher would certainly have certain qualifications. would have to be able to approach this problem without preconceived ideas, although he has probably been reading as much as he can, or conferring as much as he can, with the experts; a teacher who would be able, through his own personality, to understand the plight of the youngster and his parents, and who would be able to withstand a great deal of frustration, who could reorient his own life from the traditional academic point of view to the type of curriculum involved which might be quite different from the three R's in the usual educational objectives.

A person that flexible, that devoted, that strong, to be able to withstand the problems that would arise from this sort of exercise, would

be required.

Chairman BARDEN. That is all.

Mr. Elliott. Are there any further questions? If not, thank you very much, Mr. Rosengarten.

Our next witness is Mr. H. L. Tunney, secretary, Department of Corrections, State of New York.

Is Mr. Tunney here?

If not, our next witness is Dr. H. Schueler, chairman, Department

of Education, Hunter College.

Dr. Schueler, you may proceed. If you possibly can, hold your presentation within 7 or 8 minutes. It will be appreciated.

STATEMENT OF DR. H. SCHUELER, CHAIRMAN, DEPARTMENT OF EDUCATION, HUNTER COLLEGE

Dr. Schueler. Thank you, Mr. Chairman.

I speak on behalf of the teacher education program at Hunter College, but in a sense everything I have to say applies in the same measure, although different in details, to the teacher education programs in the other three municipal colleges in the New York City municipal college system, City College, Brooklyn College, and Queens College.

All four colleges have programs in special education and rehabilitation although they specialize in different phases. There are several suggestions that I would have to make as to possible assistance that these programs could use. It is not necessarily true that all this assistance should come from the Federal Government, but there are certain areas in which we feel that we do need assistance. Let me give you some specific examples.

For example, we feel very strongly the need for a year-round demonstration center in the special education rehabilitation, that is, a type of laboratory school. We feel very strongly that future and present teachers in special education and rehabilitation need to see the immediate, practical applications of whatever work they do in the university and need to have the opportunity to see actual demonstrations and to

practice with handicapped people who have special needs.

We have such a program in the summer session. We have a special demonstration center for our summer program. It has been so successful that we would like to expand it for the year around. Obviously, facilities are not available at the present time. We utilize resources that are used in the college during the year, demonstration resources in our campus schools, that are available only in the summer.

This I would put first in the need in this area for us, assistance in whatever way is possible, especially in physical facilities and specialized personnel. Such a center would be most valuable, not only as a demonstration center but, of course, also as a center for research, needed research in, for example, the area of the multiple handicapped. Such research, the experts tell me, is desperately needed.

A second area is, again, an extension of the research area. I have been told that many funds have been made available for research in

mental and medical health problems of the handicapped, but a rather limited amount has been made available for research into the methods of training and development to fruitful citizenship of the handicapped.

We are specifically interested in that area and would like to expand

whatever work we have been able to do.

Another area is one of assistance to students, especially future teachers, in this area of special education and rehabilitation. We have in our graduate program a student body of approximately 250. The largest proportion of this group is in part-time attendance. These may be teachers in service who take a course or two whenever the time has come to take that course.

We have very few, or relatively few, and far fewer than desirable, full-time students who can pursue an intensive program of short duration to make them fully qualified to enter the profession of training

the handicapped and those with special needs.

In order to do that, however, since there is no particular advantage, at least a monetary professional advantage, for the teacher of the special areas, we feel a very great need for fellowships, or some other type of subsistence program, to enable young people and teachers in service to spend a year with us in full-time residence in intensive study, rather than to piece out their training in the area over 4, 5, or 6 years, and perhaps even abandoning it after a while.

A third area is some assistance in the personnel of the colleges. As you undoubtedly know, the demands of this training require training in very small groups. The best analogy I can think of is in some of the more specialized laboratory sciences. To have large lecture sessions or even large seminar sessions of 30 and 35 in this area is useful up to a point, but you have to have a smaller student-teacher ratio, professor-student ratio, than is usual in most college programs.

A practical course, for example, on guidance, or one of the courses in guidance that is needed is the kind in which you have the best possible opportunity for interplay and meeting of minds with the teacher and the students. Therefore, a laboratory approach, a work-

shop approach of small groups, is needed.

Under our present resources which are partially tax levy, partially student fees, partially from private funds in special education, we find ourselves unable to even approach what we consider to be the optimum professor-student ratio. There we are seeking and continually seeking for ways to increase our staff, even with the student body that we now have, in order to make this training more meaning ful.

Another area of need is in the area of training of supervisors, people who are at work in the schools who are trained teachers but would have to coordinate programs of multiple need. In an average school you will have, if you are lucky, a classroom for the handicapped, let us say and you have all kinds in there. Most of the teachers are not prepared in all of the areas that we would like them to be prepared.

Proper supervision is most important. We would like, for example, to establish, let us say, an intensive summer institute for personnel already engaged in working with the handicapped, but on the techniques and possibilities of the supervision of the partially trained or even the nontrained people whom they have to deal with in programs of special need in the schools and in private agencies.

An analogy would be the types of intensive institutes for the training of mathematics and science teachers that have received Federal funds. We have had those at the colleges, and City College has found them most useful. To extend that type of aid to the area of special education we would find most helpful.

We feel, even with our resources, which I know are considerable, at least for a public institution, that if we were to expand our work in a more close approximation of needs, we would have to take too large a proportion of the budget that is available, let us say, for the training

of teachers of all kinds.

We train every conceivable type of teacher and supervisor in our schools. But experience has shown that the specific needs of special education require a larger proportion of such resources because of the particular problems that are involved. We feel that we have gone far enough and will not be able to go any further with our present resources, and even though we feel we are doing a good job in our programs, we are looking for assistance in various areas. The Federal Government is just one of the many.

I think that summarizes what I have to say.

Mr. Elliott. The Chair recognizes the gentleman from New Jersey.
Mr. Daniels. Dr. Schueler, were you present when the previous witness testified?

Dr. Schueler. Yes.

Mr. Daniels. He recommended a teacher be engaged to teach various children suffering from handicaps, both mental and physical.

Do you think that is a good, practical proposition?

Dr. Schueler. It is a practical proposition, because that is the reality at the present time. The extent to which any school system can afford to establish special classes for the specially handicapped is extremely limited.

Mr. Daniels. Are not various problems presented by virtue of the disabilities that each particular child has, and it might require some

special knowledge or training?

Dr. Schueler. Yes.

Mr. Daniels. Would one person be able to attend and take care

of all of those special problems?

Dr. Schueler. In any situation even approaching the satisfactory, I would say no. Of course, it depends upon the size. You would need to section according to special needs in special areas. Of course, with unlimited resources and large numbers, you can section more closely, but, for example, the orthopedically handicapped, the deaf, the blind, the mentally retarded, and the combination of the neurologically impaired and the mentally retarded with orthopedic handicaps, which are often present, and the emotionally disturbed, each of these areas presents very special problems.

There are common things, of course. But to put them all in one room, even though it has to be done, and have one person expected to

do it all, I think is tragic.

Mr. Daniels. Therefore, it requires training of personnel to deal with each individual problem.

Dr. Schueler. That is right; yes, sir.

Mr. Daniels. Thank you.

Mr. Elliott. The Chair recognizes the gentleman from Connecticut.

Mr. Giaimo. Doctor, you are speaking of existing projects and enlarging them with Federal funds; is that the idea?

Dr. Schueler. That is right.

Mr. Giaimo. Can you tell me what part the States are playing in

the enlargement of these projects, if any?

Dr. Schueler. I have no specific knowledge. I know there is some assistance gotten through the States, and through special legislation in the State of New York attempts are being made for special education. The specific nature of that I have no immediate knowledge of.

Mr. Giaimo. What you are suggesting is that we enlarge the train-

ing of personnel and supervisors?

Dr. Schueler. Yes. There is obviously a need for no duplication of State and Federal effort, but a coordination of the two.

Mr. GIAIMO. That is all. Mr. Elliott. Mr. Lafore? Mr. Lafore. No questions. Mr. Elliott. Mr. Lindsay?

Mr. Lindsay. No questions, Mr. Chairman. Mr. Elliott. Thank you very much, Dr. Schueler. Your testimony has been helpful and we appreciate it very much.

Our next witness is Mr. Joseph Prendergast, executive director of

the National Recreation Association.

Is Mr. Prendergast present?

Miss Hill. I am representing Mr. Prendergast.

I am Beatrice Hill, director of the consultant service recreation for the ill and handicapped of the National Recreation Association.

STATEMENT OF MISS BEATRICE HILL, DIRECTOR, CONSULTANT SERVICE RECREATION FOR THE ILL AND HANDICAPPED OF THE NATIONAL RECREATION ASSOCIATION

Mr. Elliott. You are appearing for Mr. Prendergast?

Miss Hill. Yes.

This is my specialty.

Mr. Elliott. You may proceed. Miss Hull. Thank you very much.

It is not my purpose here in any way to quarrel with the concept of the rehabilitation of the chronically ill and handicapped. We are all gathered here precisely because of one thing, our belief in this, the third phase of medicine, rehabilitation, and because all of us wish to contribute whatever we can toward expanding and improving this service, rehabilitation, to the severely ill and handicapped citizens of the United States.

We in the reclamation profession have no cause to question what has been done rehabilitatively for the chronically ill and handicapped. But we do question what is not being done for them, the unmet needs.

I am speaking here both of the vocationally rehabilitatible and of

the supposedly nonemployable.

On the subject of who can and who cannot be gainfully employed, let me tell you the story of a very dear friend of mine, Jimmy Seaborn. The year is 1949. The boy Jimmy is 18 years old. The diagnosis is rheumatoid arthritis. It affected his entire spine. Vocational rehabilitation rating is zero.

Rehabilitation teams say, "Sorry, kid, we can't do a darn thing for you. You are just going to have to spend the rest of your life in a chronic hospital here in New York City." He had no family.

Today, 10 years later, Jimmy, unable to either walk or sit, is limited in movement to a slow-motion shuffle on crutches, or he gets all over the place on a self-propelled stretcher, is a full-time recreation leader at the prevailing wage scale in the St. Joseph's Home for the Aged in Peoria, Ill., 1,000 miles from Goldwater Memorial Hospital in New York City, for so many years his permanent home.

How did this come to be?

America?

No. The answer to Jimmy Seaborn and his triumph over his crippling handicap was motivation through social rehabilitation; in short, developing in him a driving need to function to the fullest degree possible within the limitations of his handicap and the knowledge and skills necessary to satisfy the need.

Ten years ago, when I first met Jimmy, he was technically on the verge of melancholia, living in one of Goldwater's 32 wards. They have 2,000 patients, with little or no contact with people beyond their own ward. He was discovered by me in one of my tours of the ward.

I was recreation therapist there.

The first step in the development of James Seaborn, recreation leader, was taken. I persuaded him to join the patients' glee club. In a short while, not too many months later, Jimmy became the glee club director.

Then I talked him into becoming a reporter on the patient's newspaper. I am saying this as if it went quickly, but it didn't. It was very slow. He went on the newspaper and became the editor of the

newspaper.

So it went over the years, with constant encouragement, motivation in recreation therapy and skills. He participated in dramatics, arts, crafts, the hospital intercom radio operation; in short, all the activities which make up a well-rounded program of recreation in a

hospital.

Today, as I said, this boy who cannot sit in a chair as you or I, can only move with the greatest of difficulty, directs a complete recreational program for the aged. He recruits and trains volunteer aids in Peoria. He motivates the aged patients of St. Joseph's Home toward the social community which is necessary if the home is to be a community, not just a home, in the true sense of the word. They are not just there to wait for death.

This is just one example, but an extraordinary one, of the value of recreational therapy as a tool in helping to motivate the seriously handicapped to the point where whatever potential is left is susceptible

to vocational rehabilitation.

It is not our claim that all persons as severely handicapped as Jimmy can develop their employment potential to the degree that he did, but there are thousands and thousands of Jimmys. We see them all the time, institutionalized and noninstitutionalized, of all ages, and they have never gotten their chance, because at the time of interview and evaluation there seemed to be no possibility of vocationally re-

habilitating them. Due to their severe disability, they had been iso-

lated, either in the hospital or their own home.

Thus, through their lack of group contact, they had not had the opportunity to be able to learn to feel confident and to express themselves in the best possible manner. And also, perhaps, the most wonderful thing about the Jimmy story is not that he was employed 4 months ago, but rather that he was happy in the 9 years prior to that in the real community atmosphere which regularly programed recreation created in this hospital.

This brings me to the suitability of the vocationally nonemployable. What a very big subject that is, embracing several million chronically ill or handicapped people. To be very trite, a statement we all make 10 times a day, medical science has added many years to these people's But what is being done to make their lives meaningful?

Take one of my pet targets, which is the nursing homes. There are 25,000, and they are only just beginning nursing homes in this coun-

They house 450,000 people.

In no place that I have discovered in the Hill-Burton Act is the need for recreation activities, for food for the mind as well as for the body, emphasized before any one of these nursing homes can be built.

I and my organization, the National Recreation Association, have been and are intimately concerned with the developments of recrea-

tion activities in any and all nursing homes.

Two years ago, and that is not awfully long ago, less than 1 percent of the nursing homes out of this group of 25,000 had any type, leave alone what type, of recreation activities for their old people.

As Dr. Russell says, they were given "bed and bored.

Today we are beginning to make excellent headway through a plan

we developed.

I also want to say that we now have serviced over 1,000 nursing homes by the most simple thing, simply that if a home can't afford a recreation leader, which they can't—how can an 18-bed home afford one recreation leader—we get six or seven together in the area to coordinate salary and basic equipment, and then recruit and train volunteers in the community to service this home.

You would think I had made an Einstein discovery, but it was very simple. Now over a thousand homes that we have account of have

recreation, and there are still 24,000 more to go.

During the course of this work in nursing homes and voluntary workers in the homes, I have had many contacts with social workers, some of them working with the Federal Government. This is what I hear over and over again: "Miss Hill, first things come first. are so many essentials that need attention first. Food, adequate nursing care, fire hazards," and on and on.

My answer is: "Since when in our culture has the sustenance of the spirit ceased to be a basic essential to the normal living? What is the use of keeping the person alive if there is nothing to live for?"

To me, this goes hand in hand, recreation activities—whatever you want to call it—with good nursing care and fire safety. I think the Government should be very concerned in this area.

Current studies show that without meaningful activity the mind as well as the body regresses. There are about 25 studies, which I can show anyone interested, proving exactly this. Regression comes by lack of activities in the aged. Our minds apparently do not stand still. They either go forward or backward, and without activity they

go backward.

Our viewpoint is that it is important, as I said, to the nursing or care of the individual; just so important is recreation activity, social communication, food for the mind, as well as the body, and there must be legislation and it must be enforced.

These people cannot be put in these homes and left there to die.

According to the Office of Vocational Rehabilitation, there are several million chronically ill or handicapped homebound individuals in the United States. The figure I believe, is 4 million that are homebound. Fewer than 200 agencies—and most of them are the small voluntary groups, none within New York City—do anything in the way of meeting the recreational social communication needs of these shut-ins. Very, very few of these people are serviced socially.

Again, like the old people in the homes, they sit studying alone in their rooms, in their homes, homebound, day after day and year after year, staring at the windows. Nobody comes to see them, and they go to see nobody. Recreation can be brought to them, and with proper planning a great lot of these people can go to places of

recreation in the community via adequate transportation.

It should be the responsibility of agencies servicing the homebound that they are not only given occupational therapy occasionally, physical medicine, social service, and housekeeping, but what about the

most important thing-happiness?

Social rehabilitation must be provided, and it can be done. Any time I am asked, I can tell you. I sincerely believe that the rehabilitation team cannot fully determine the extent of the patient limitation, physical or mental, without proper evaluation of his social potential. This can only be studied in the context of social activity. Fewer than 2,000 of our 7,000 hospitals provide recreational services to their long-term chronically ill patients. The patient's ills are ably treated. His physical surroundings for the most part are comfortable. But little or nothing is being done to help him adjust to his surroundings and hospital routine, to help sustain or cultivate his morale, to contribute to the general welfare of his whole being by providing enjoyable experiences and opportunities for social expression.

There is also a dramatic need in the pure rehabilitation setting. We should have a ward in a hospital, a rehabilitation ward, or be it a clinic, for programing which will help the patient learn new social activities which accommodate his physical or mental rehabilitation. And more than just teaching him things he can do for happiness with his handicap, the department needs to go further. They need to evaluate his family and the community to which the patient is going to return and see where are the available social outlets, recreational outlets, and be sure that the patient learns of them, and doubly be sure that the patient is welcomed by the bowling alley, the hobby club, or wherever it is, wherever he can find some happiness when he returns, a rehabilitated but handicapped individual.

Another area of great need is playgrounds for children. I don't remember how many thousands of playgrounds—there were so many that I couldn't get a count for today—there are in the United States. But I had sent questionnaires around to every one of them a year ago.

It was in the thousands. I got answers from 247 playgrounds that in any way—I am not going into the quality—the handicapped child was allowed to play or provision made for him in this country.

Take your neighborhood centers around the United States, the

Take your neighborhood centers around the United States, the camps, the centers for the aged, if you accept the handicapped, young or old. A statistical count of those that do is very, very small.

That the Federal Government is mindful of the importance of recreation therapy is clearly evidence by the wonderful programing which is an essential part of the total care program of every service and Veterans' Administration hospital in this country. But much further, Federal aid is needed to adequately develop this much-needed service, recreation for our ill and handicapped population, whatever their surroundings be—hospital, home, nursing home, or furnished room.

Grants are needed to do research, to properly evaluate the job to be done in recreation and how best to do it. Money is needed to develop demonstration projects in recreation for the ill and handicapped.

Finally, to develop visual material, particularly pamphlets and manuals, presenting the findings and studies of the demonstrations

and studies for recreation for the ill and handicapped.

Without social communication, which is the end result of recreational

therapy, there can be no independent living.

In conclusion, there is a great difference, as you all know so well, between isolation and independence. Independence means freedom and the ability to form relationships with others; dependency can be a great isolating factor. There must be a reinterpretation of rehabilitation agencies and services, and vocation must not always be the main goal. To quote a doctor friend of mine, "There is a need to make a life rather than a living."

Thank you very much. I hope I got in under 10 minutes.

Mr. Elliott. Thank you, Miss Hill. Your presentation was very interesting. We appreciate it very much.

Miss HILL. Thank you.

Mr. Eliott. Are there any questions?

If not, thank you very much.

May I say that Dr. Merel Frampton, who is the director of the Special Rehabilitation Study of the Subcommittee on Special Education of our committee, has a statement for the record, I believe, from some gentleman who was scheduled to testify.

Dr. Frampton. Ernest E. L. Hammer, president of the Lavelle School for the Blind, could not be here today, and requested that I present this statement of his testimony to be received by your com-

mittee.

If it meets your pleasure, I would like to so present this statement and request that it be included in the record.

Mr. Elliott. Without objection, the statement will be made a part of the record at this point.

(Statement referred to follows:)

MEMORANDUM SUBMITTED BY HON. ERNEST E. L. HAMMER, PRESIDENT OF LAVELLE SCHOOL FOR THE BLIND, NEW YORK CITY, N.Y.

Speaking only from my personal experience as president of Lavelle School since 1952, as a trustee since 1927, and personal contact since 1916, I am of the opinion that each and every blind and handicapped child should be given such

public aid as will place each child in a position of comparable equality with

normal children.

By rough estimate, in the United States in 1951 the number of blind persons of all ages amounted to 330,000, and of that number 30,200 were under 21 years. The numbers stated for 1940 were 230,354 and under 21 years 22,400, and in 1950 the figures were 297,000 and 25,600, respectively. This indicates an increase of the under-21 group of about 12½ percent in 10 years and about 40 percent in 16 years. This also indicates an increase of approximately $2\frac{1}{2}$ percent per year.

Mr. M. Robert Barnett, executive director of the American Foundation for the Blind, Inc., in testimony as an expert on handicaps in respect of the condition of blindness, per se, and in the relationships of the blind with the sighted in family, home, school, and in adult social life and gainful employment, referred

to some significant statistics as of 1959. He stated:

"At the moment, the best estimates place the total number of blind people in the United States at about 350,000. Statisticians predict that the number will be in excess of 400,000 by 1970. About 10 percent are of school age, meaning more accurately under 21, while the most significant age breakdown is that of 65 years of age and over, into which category more than half of the total number falls. Somewhere in between are those of so-called employable age. However, the actual percentage of clearly employable people comes down markedly because of factors which complicate simple blindness."

This indicates an increase of one-seventh or about 14 percent in about 10 years. In 1956, Lavelle School had an attendance of 102. If Lavelle School attendance, which in 1956 was 102, and in 1959 was 185, merely increases at the rate of $2\frac{1}{2}$ percent per year, in 1969 we would have 231 and in 1979 about 277. However, our attendance increase in the 5 years from 1954 to 1959 was 83 in numbers and rough percentage about 16 percent per year, or the indicated additional attendance of 333 in the next 5 years. Even if this estimate were discounted by 50 percent per year, it would result in about 40 percent increase or 259 pupils in 5 years and 80 percent in 10 years; i.e., an addition of 148 or a total of 333 children in 1969. This type of thinking leads one intimately familiar with Lavelle School, its facilities, administration, management, and progress to the estimate of about 300 children in attendance in 10 years, but in no event less than 200 to 250 in the intervening years.

My personal services, and the services of the other officers and trustees, of course, are given gratuitously to Lavelle School for the Blind, the children in attendance, and the school's graduates in high schools, colleges, and in their later business and social lives and their useful participation in the activities of society. In New York State there are three so-called residential schools for the blind. They are the New York State School for the Blind at Batavia, N.Y.; the Institute for the Blind and Lavelle School for the Blind, both of the latter being in Bronx County, New York City. These schools, formerly completely residential, have become mainly day schools. This change from residential school to residence at home has occurred by reason of the change in thinking and policy of the New York State Department of Education and that of educators and sociologists in regard to the family and parents' relationship and the home and social life as more beneficial to the handicapped than residence at school.

The services rendered by the administrative staffs, the superintendents, principals, teachers, nurses, physicians, psychologists, social workers, and other assistants, as well as by the executives, trustees, and directors, undoubtedly extend out and have an influence in the general welfare of the blind and other handicapped. In a measure, therefore, that which is good for one school or institution becomes a benefit to others and is helpful for the common good.

This outspreading of benefits also undoubtedly helps in the education and attitudes of the public generally in respect of the blind and the otherwise handicapped. It also, I believe, tends to relieve or reduce psychosocial, organic, physiological, and other medically known factors which may disturb the blind and the handicapped and prevents mental blocks or attitudes rendering it difficult for the handicapped child and sometimes even the adult to make normal use of existing capacities and abilities. Behaviorisms resulting from mental disturbance sometimes cause animosities, resentments, and retailatory acts on the part of the handicapped or the other normal person in particular association or transaction and consequent unfair judgment or action on one side or the other.

The law of the State of New York (art. 89, secs. 4401, 4402, et seq.) defines "a physical handicapped child" as a person under the age of 21 years, who by reason of a physical defect or infirmity, whether congenital or acquired by accident, injury, or disease, is or may be expected to be totally or partially incapacitated for education or for remunerative occupation. In section 4402, which sets forth the duties of the State education department, the department is required—

1. "* * * to use all means and measures necessary to adequately meet physical and educational needs of such children as provided by law."

2. "To stimulate all private and public efforts designed to relieve, care for, cure, or educate physically handicapped and mentally retarded children, and to coordinate such efforts with the work and function of governmental agencies."

The State law in subsequent sections 4403, 4404, and 4405 provides for similar obligations and duties for the city of New York and the school districts outside of the city and their respective appropriate officers and agents. State financial assistance is also authorized and provided as also are approved special teachers, psychologists, and medical help. There is also provision for the establishment of camps for temporary vacations. In addition, if it be found in exceptional cases that the facilities within the State are inadequate, then the State department may send the child at State expense, not to exceed \$2,000, to an institution outside the State found to have appropriate adequate facilities.

This legally authorized obligated service by the State of New York and its agencies is excellent. Modify that by the recognized right of parents to select the school of recognized standards and the service is practically perfect.

It appears to be obvious that the best service that can be rendered to aid the blind and other handicapped persons is direct individual service rather than service so generalized that little of it gets as far down as to reach any of the individuals who are the actual intended objects of the bounty obtained either by public solicitation or legislative appropriation and taxation. In New York State two of the three schools of preeminent reputation in the education of blind children, namely, New York Institute for the Blind and Lavelle School for the Blind are operated by organizations formed for that particular purpose. Funds are required greatly in addition to those provided by State, city, or school district aid.

The land had to be acquired, the building erected, and the equipment and furnishings provided. Maintenance, repairs and additions, including extensions and new buildings, are constant or recurring expenses. There are many other miscellaneous and newly required expenditures wholly outside the items considered in the amount of aid given for the children appointed by the department of education and other State agencies for attendance at the particular school.

Lavelle School for the Blind is a corporation organized under and existing by virtue of the laws of the State of New York. Its purposes stated in its certificate

of incorporation are the following:

"Second: The particular objects for which the corporation is to be formed, are to perform such work among the blind, as will tend to promote their mental,

moral and physical development, welfare and advancement.'

Lavelle School is authorized and does receive money and other gifts and bequests which have been expended for the items referred to and the objects and purposes of the school and corporation. In its maintenance, the annual deficit, beyond public aid, is about \$45,000. This does not include structural or unusual repairs. The officers and trustees render their services without compensation, and the Dominican Sisters, a superintendent and a principal, and qualified teachers of regular subjects and music, who are in residence at the school, directly care for and teach the children, render voluntary service without compensation, except for board and a small monthly donation to the community. In addition, there are lay teachers, a registered nurse, social worker, psychologist, medical doctor, ophthalmologist, and pediatrician. Office dental service is also furnished.

Specifically, I am of the opinion that such Federal aid as is provided for the education and care of blind children socially, medically, and in formal school education should be given directly to the blind as far as that is possible, rather than spread among quasi-public eleemosynary or charitable, educational, or welfare organizations having the avowed purpose of improving or alleviating the condition of the blind through general activities of formulation of rules and regulations, inspection, and visitation, and statistically rating of schools and institutions directly engaged in the care and education of blind, or otherwise

handicapped children.

It must be stated with enthusiastic approbation that many such general organizations have been helpful and some have accomplished excellent results for the blind, and otherwise handicapped. What is said here is not intended as

criticism of any of them.

It is my opinion, nevertheless, that Federal aid, if given, should be allotted directly to the blind and the handicapped, or appropriated for governmental agencies directly in charge of supervision and regulation, such as those in New York State previously mentioned by me. Public funds should also be provided to aid in training teachers, nurses, social workers, and also ophthalmologists, pediatricians, and psychologists, or to enable them to add to and perfect their specialized aptitudes for the care and improvement of conditions found.

All direct and ancillary public services should have sufficient appropriated funds to supply the needs of blind and other handicapped children. Funds through Federal loans should be made, or direct grants should be provided for one-half the amount needed for capital investment in necessary new buildings or additions, where the particular school seeking aid has on hand the other equal one-half for the necessary constructions and the furnishings and equipment also required. Federal funds should also be supplied, when necessary, for education, care and maintenance, and rehabilitation services at the level of secondary schools.

After careful and protracted consideration of the matter under consideration by your Committee on Education and Labor, the above conclusory suggestions have been determined upon by me. I trust that they will be helpful to your

committee.

Mr. Elliott. The subcommittee will now recess until 1:30.

The witnesses, including Mr. Bristow, who did not get here this morning, will be heard first. I will call the list of those who did not come. We will start with them and try to finish today's group by this afternoon.

(Thereupon, at 12:20 p.m., the committee recessed, to reconvene at 1:30 p.m. same day.)

AFTERNOON SESSION

The committee reconvened at 1:30 p.m., upon the expiration of the recess.

Mr. Elliott. The subcommittee will be in order.

We will begin this afternoon by calling the roll of those witnesses who did not appear this morning, who were scheduled.

Mr. Loberfeld. Mr. Cloud.

Mr. Bristow.

Mr. Bristow, you will be first.

Let me say to all of you that the subcommittee deeply appreciates the witnesses coming here to testify today. The witnesses are numerous. If you possibly can, confine your remarks to a summary of your statements, with the understanding that the full, complete, written statement will go into the record.

With that understanding, you may proceed, Mr. Bristow.

STATEMENT OF WILLIAM H. BRISTOW, DIRECTOR, NEW YORK CITY BOARD OF EDUCATION, BUREAU OF CURRICULUM RESEARCH

Mr. Bristow. I have two observations. The first one is with respect to H.R. 3465.

There is a concern on the part of some of us that the administrative operation of this bill in relation to the use of the advisory boards of vocational education may not give the proper balance to the health factors which seem to be paramount in this particular effort to extend

vocational rehabilitation to the employable people without the specific

job objective goal.

The task of vocational rehabilitation for employment is very, very large. It is the concern of some of us that we may be getting into kinds of patterns; especially as the administration comes into the State.

That is one observation.

The second observation, and the reason why I value very much an opportunity to come before the committee, is to put into the record a very troublesome problem for teachers and administrators—that is, the development of teaching materials for youngsters, and also the development of suggestions and materials which will help teachers in carrying forward their program.

As the problem of teaching becomes more difficult, and as we enlist the more teachers for special education, we are called upon to provide more rapid means of orientation and to provide teachers with better

materials than they have heretofore had.

This is corollary to, for instance, the whole teacher training program—that is, the teacher training program that is projected with respect to blind people seems to me to be something that we ought to encourage.

But corollary to it is the research incident to the production of publication, the distribution and the use of text materials, audiovisual materials, and other materials that are especially adapted to the needs of special education.

You don't have to think very far to realize the need for this with respect to the blind and the hard of hearing, and especially with re-

spect to the retarded.

One of the problems that faces almost every school system and every teacher is the need for getting appropriate materials that can be used, that are adapted to the youngsters under their charge, regardless of the area of special education.

The problem needs both public and private support.

Up to now the text materials and other kinds of materials have largely come to us from textbook companies and others who have found it possible to develop these materials and to get sufficient reward from their sales.

In this area, very often, materials are too limited—that is, the sale possibility is too limited to make them a profitable venture, and,

therefore, we need to look for a new and different alinement.

This requires staff work. It requires making it possible for people who otherwise would not be free to work on materials to have time to work on projects of this sort.

Up to now, we have depended upon the good will of the teachers, the interests of the teachers, the interest of the systems, to develop

the materials, and to make them then available.

My purpose here is to call, if I may, this important item to the attention of the committee and hope that I might put into the record some other materials which would outline in more detail what some of the possibilities are.

Mr. Elliott. We will be happy to have the additional materials

which you have, Mr. Bristow.

1. 12.1

Mr. Bristow. I would like to submit those, if I may. Is it possible to submit for the record the things that I do not have here?

Mr. Elliott. Yes.

Mr. Bristow. Thank you.

Mr. Elliott. If you could let us have those in about a week, let's say in 10 days from today—that will be by the 8th of this November—if you can have them to us by that time, that will be satisfactory.

Mr. Bristow. Yes.

Mr. Elliott. Are there any questions of Mr. Bristow? Chairman Barden. May I ask this one question?

Do you recommend in your statement who shall prepare this

material.

Mr. Bristow. My own feeling is that much of it must be prepared by the school system—the State or the local school system—and that that is chargeable to the instructional program, although I am of the opinion that there are possibilities for developing materials on a larger basis which would eventually get into the regular stream of the publishing industry in this country.

But the publication in the first instance very often cannot be

charged against a commercial distribution of a publication.

Chairman Barden. You are suggesting that the Federal Govern-

ment take part in the financing?

Mr. Bristow. I am suggesting that we find some way to subsidize the development of such materials either on a State or on a local basis.

For instance, we are subsidizing research at the moment. But almost none of that research is directed toward materials. It is directed primarily at special problems in relation to the retarded—that is, why did they get that way; and how do you deal with them individually?

But the nub of this whole business finally is the teacher working

with the youngster in a classroom with certain materials.

Up to now, at least in our experience, the teachers have been largely responsible for developing their materials in their own classroom. I would not want to relieve them of developing such materials as are appropriate, locally.

But we need, and we don't quite know how to do it, to get materials

that can be used on a broader basis.

Chairman Barden. I just wanted to be sure that you were not

suggesting that the material be prepared on the Federal level.

Mr. Bristow. No, I don't think it is on that basis. I think there is the possibility, though, of it being prepared at various spots and then being made available through regular channels—not through the Government, but through regular channels, for other people.

We have had a little experience ourselves in relation to the preparation of reading materials for the retarded, and there are instances

throughout the country.

But the thing is not pulled together by any means.

Mr. Elliott. Are there any further questions of Dr. Bristow?

If not, thank you very much, Dr. Bristow.

Our next witness is Sister Rose Gertrude, of the St. Mary's School for the Deaf.

STATEMENT OF SISTER ROSE GERTRUDE, ST. MARY'S SCHOOL FOR THE DEAF

Mr. Elliott. You may proceed in any manner you see fit, Sister Rose.

Sister Rose Gertrude. Good afternoon, gentlemen. This is the first time we have ever attended a public hearing on a congressional bill. But we are here today to support the bill that will provide trained personnel to alleviate the handicaps of deafness.

We are from St. Mary's School for the Deaf in Buffalo, N.Y., where there are more than 330 severely deaf and hard-of-hearing children

enrolled

Since 1937 a cooperative program has been carried on between St. Mary's and the University of Buffalo to train teachers of the deaf. The program is approved by the New York State Department of Education, and it is also 1 of the 22 teacher-training centers approved by the Conference of Executives of American Schools for the Deaf for training teachers of the deaf.

There was an estimated shortage of more than 350 teachers of the deaf this fall, and it is expected 500 annually will be needed for the

next several years.

Last year at St. Mary's there were 10 in training, and we received 25 requests for teachers from various schools and day classes. We

needed five in our own school, so only five were available.

This year there are only 14 in the class. Those from out of town especially find it most difficult to get along financially. Some of the trainees gave up remunerative positions to enter this field, and we hope that they can stay in it.

Many college students visit St. Mary's from Buffalo State Teachers College, Fredonia State Teachers College, and others. They evidence

great interest in the work.

But the obstacle of that extra year without a salary seems insurmountable. Teachers are needed not only in schools for the deaf, but also in day classes, day schools, and speech and hearing clinics. The basic training received makes it possible to become not only professional teachers in this field, but also in related fields. Some student teachers trained at St. Mary's have later specialized in audiology, speech correction, vocational guidance, and in administrative positions.

Some of our students have worked at the Walter Reed Hospital. The opportunity is given at the school to work with severely deaf and hard-of-hearing children from the age of 3 to 20, for the program

ranges from preschool through high school.

Among these are also multiple-handicapped deaf children, such as

cerebral palsy, slow learners, and visually handicapped.

There is need for many qualified teachers to specialize in teaching these children. Some means must be found to facilitate the recruiting and training of teachers in this highly specialized field of deafness and its allied fields.

The problem has become acute. Each year the enrollment of deaf children increases about 400. Last year it was reputed to be 1,200.

You might think this would not mean many more teachers, but

for young deaf children, 5 or 6 in a class is maximum, and not more than 10 or 12 can be enrolled in each class for the older children, for

the child totally or severely deaf from infancy is educationally handicapped rather than physically handicapped, who can run and play, laugh and cry, and is apparently normal, yet he has no means of communication with others, no speech, no language upon which depends all intellectual development.

A hearing child who enrolls in a nursery school has an estimated vocabulary of from 2,000 to 5,000 words. A deaf child has none. It requires individual teaching by an especially trained teacher to

develop his vocabulary.

At the end of the first year in preschool, he may know a few hun-

dred words in lipreading, but, of course, not in speech.

The teaching of speech to the deaf is the most difficult task of all. The teacher must have the necessary technical knowledge and great skill to succeed. Each child responds differently. One child may require months of patient work and drill to give a clear sound. Another may have difficulty in learning to give K or S and so on, so intensive speech work must continue all through the school years.

Then language must be built up gradually. First, sentences of two words are taught, "I know," "I feel," "I bowed."

Then those of three words, "I have a top," "I threw a ball," then five, "I put a ball on the chair," and so forth.

It will require perhaps 3 years of intensive school work before the child reaches this step in sentence building, before he has mastered the meaning of pronouns, the difference between in and on, under. The proper form of the verb, so that he can use such language principles to express his needs, his thoughts, his experiences.

Then all the question forms must be taught and used, "who," "what,"

"where," "when," "why."

The English language is conceded to be one of the most difficult to The deaf child has no background of any language to serve as the basis of comparison. His language and vocabulary difficulties last all through his life. He only learns the words he is taught.

The various school subjects have to be modified to meet his under-

standing.

In the light of the above brief statement, one can see the need for small classes, the need for highly qualified teachers of the deaf, and the need for special schools for the deaf.

Each year, some teachers retire or leave to establish homes, a few receive exchange fellowships to teach in foreign countries, and these and

other causes deplete the ranks of trained teachers.

At St. Mary's, we try to give a little help financially to 10 prospective teachers each year, to enable them to take the training course. We use their services as substitute teachers for special coaching, teacher aids, and the like, and pay them as assistant teachers. The cost of living and the classes, however, is high, and the trainee finds it very difficult to get along, especially after just finishing college.

We hope this proposed bill, H.J. Res. 494, will supply the help that is so desperately needed to train teachers for those who are afflicted

with deafness.

The deaf child has a God-given right to the education that will make him a happy, self-respecting, self-supporting citizen. Only those teachers who are especially trained can reach the mind closed by deafness, and so develop and educate the child physically, intellectually, socially, and spiritually.

Thank you.

Mr. Elliott. Thank you very much. Do you have any questions, Mr. Barden?

Chairman Barden. No questions. Mr. Elliott. Mr. Daniels?

Mr. Daniels. I have no questions. Mr. Elliott. Mr. Giaimo?

Mr. Giaimo. No questions. Mr. Elliott. Are there any questions?

If not, thank you very much for a very fine presentation.

Our next witness is Dr. S. S. Bluestone, director of the New York State Rehabilitation Hospital.

STATEMENT OF DR. S. S. BLUESTONE, DIRECTOR, DEPARTMENT OF HEALTH, NEW YORK STATE REHABILITATION HOSPITAL

Mr. Elliott. We are very happy to have you, Doctor. If you can, summarize your views with reference to these several matters in about 10 minutes.

Dr. Bluestone. I believe I can, sir.

I am a physician, director of the New York State Rehabilitation Hospital at West Haverstraw, which is a unit of the New York State Department of Health.

Our commissioner has asked me to express his regrets at being unable to attend this hearing, but he does hope to attend later hearings of the

committee concerning H.R. 3465.

I have been told to state that my statement does not necessarily represent the views of the Governor of the State of New York.

Briefly, on my own qualifications, I have been in medicine for 16 years, and that included 1 year as public health and welfare officer in the U.S. Military Government in Korea. I engaged in private practice of medicine after having been formally trained in the field of pediatrics; since 1954 I have been solely in the field of rehabilitation, both clinically and as administrator, being in my present position since July 1957.

Mr. Elliott. Where is this rehabilitation center?

Dr. Bluestone. About 40 miles from New York City.

I am assistant clinical professor of clinical medicine at New York University, and also a member of the New York State Interdepart-

mental Health Board.

The hospital has 204 beds, which are devoted exclusively to rehabilitation and provide comprehensive services to patients of all ages and to the wide variety of disabilities, which include spinal cord injuries, strokes, cerebral palsy, arthritis, and many others.

The hospital has a mandatory daily charge of \$13, about half of the

cost, the deficit being met out of State funds each year.

For the purpose of attracting the participation of the welfare departments in a special project, we established a reduced rate of \$5 per day for patients referred to by welfare departments.

I am very strongly in favor of the aims of H.R. 3465, particularly as regards the provision of rehabilitation services for handicapped

adults, whose potential may be somewhat less in employment or re-

employment.

The rehabilitation hospital now has to turn away many such people whose means do not permit personal payment of even our modest rates but who, nevertheless, are not eligible for financial assistance under existing programs.

Truly, the hospital is unable to serve all of those who are referred. We have a waiting list now which is about equal to half of our capacity,

and admission delay is estimated at 2 to 3 months.

However, it is not in keeping with our philosophy to have to select our patients on the basis of their financial resources. It is too well known that disability is accompanied by loss of income and exhaustion of savings.

Under this pilot welfare project that I mentioned, we admitted a total of 540 disabled welfare recipients. These people were not eligible

for our services under the vocational rehabilitation laws.

Of the 540, I might mention that all of them presented the worst

physical, social, and psychological problems that we see.

Of the 540, we selected a random sample of 99 who have been studied in their home communities 6 months and longer after discharge from

the hospital.

Viewed from the standpoint of personal care alone, there were 71 individuals who at the time of admission required attendant care. Of these 71, 28, or 39 percent, were completely independent at the time of the field visit 6 months or longer after discharge from the hospital.

Of those, some were completely independent, even outside the home. Of 11 individuals who prior to admission were able to take care of themselves at home, 5 were able to extend their activities outside of the home. Many others made lesser gains. While wholeheartedly endorsing the principle of H.R. 3465, I recommend its amendment so that the Governor in each State will be allowed to select a particular agency in that State best qualified to administer the independent living program, and so that the State and local health departments would be required to participate in the provision of medical services under the bill.

Operating rehabilitation service programs have become identified as being medically oriented or vocationally oriented, each discipline having relatively minor assistance from the other and each having personnel in the professions of psychology and social services.

The population to be served under this bill by these definitions has no object of use vocational prospects. The primary need, therefore,

is for medical and allied services.

The wording of the bill itself recognizes this in its words of services, section 206(a) and of rehabilitation services, section 403, and in its requirements for grants for rehabilitation facilities, section 302(b)(2)(B).

The vocational agency and professional personnel in the vocational field can be expected to play no more than an incidental role and that only if the vocational potential becomes manifest in the patients

as a result of medical services.

It is my belief that even the existing vocational rehabilitation program would benefit if the medical aspects of the program were administered by a medical agency.

The proposed program, under H.R. 3465, is a radical departure from the deeply ingrained work-oriented philosophy of vocational coun-

selors in vocational agencies.

On the other hand, in New York State, for example, the health department is represented by important elements in every county. A physician administrator, the health officer, is in charge, whose training includes medical, social, and psychological aspects of chronic disease and disablements. He knows the available skills in the county, the hospital and treatment facilities intimately. He is already providing medical, nursing, and physical therapy services and even social service. Through his friendship and liaison with the practicing physicians in the area, the health officer already identifies those individuals who need rehabilitation services immediately after the onset of their disability, when such services are most valuable and most effective. As a physician, he has the respect and confidence of other physicians and can readily translate the short technical reports of the other physicians into terms which are readily understood by the allied professional people.

The health officer is already providing the necessary support of services to help the patient retain his independence. The rehabilitation hospital and other similar centers make routine referrals to units of the health department in New York City. The State and local health departments are already active in research to complete the needs of

the nonemployable, aged, and disabled.

The New York State Department of Health is already providing training funds and programs for the various specialists needed in rehabilitation. It already has an extensive program of public education, geared to the prevention of disability, and to the prevention of

the secondary effects of disability.

Finally, the New York State Department of Health already has proven channels for interagency cooperation and referral with the State and county departments of welfare, with the division of vocational rehabilitation of the State education department, with the department of mental hygiene, with a large number of voluntary and public agencies.

In conclusion, I have indicated that the means to achieve independent living as defined in H.R. 3465 is through the provision of medical services. But such services should be administered by a medical agency and, in New York City, the health department is emi-

nently qualified to undertake its administration.

It is urged, therefore, that the bill be amended to permit each State's Governor to designate the agency in that State to administer the bill, but that he be required, in any event, to place the medical aspects of the bill under the direct supervision of the State department of health.

Thank you, gentlemen, for the privilege of being permitted to ex-

press my views.

Mr. Elliott. Thank you very much, Doctor.

Are there any questions?

If not, we thank you very much for the information you have brought us, Dr. Bluestone.

Dr. Bluestone. Thank you.

Mr. Elliott. Our next witness is Mr. Ben Light, secretary, Ithaca College.

STATEMENT OF BEN LIGHT, SECRETARY, ITHACA COLLEGE, ITHACA, N.Y.

Mr. Elliott. How far is it to Ithaca, Mr. Light?

Mr. Light. Two hundred and forty miles.

My statement will be rather brief. I am representing Dr. Dillingham, who is unable to appear here today.

Ithaca College supports wholeheartedly the proposed legislation in

the bill and resolutions.

We prepare teachers of speech and emphasize correction, but do not feel that our experience in this field permits us to make practical suggestions regarding the training of teachers for the deaf, or speech pathologists and audiologists as outlined in the resolutions.

With regard to H.R. 3465, we do feel that our experience permits us to call your attention to the following facts and to make a special representation for Federal aid for physical plants, families, and workshops in the fields of physical therapy, recreation, health and

physical education.

Our school of health and physical education was initiated by the college in 1926. Since 1931 we have awarded the bachelor of science degree of 1,852 men and women majoring in physical education. Most of these graduates are currently employed in public school systems of New York and many other States, while others are teaching in private schools and colleges.

O division of physical therapy was started in 1948 and has gradu-

ated 278 men and women since that time.

Mr. Elliott. What was that date?

Mr. Light. 1948.

Practically all are now engaged in professional work in this field. We have enrolled currently 98 physical therapy majors who study at our Ithaca, N.Y., campus for the first 3 years. Their senior year is spent studying at Albert Einstein Medical College in New York City, with whom we are affiliated. After the academic work is completed in June of their senior year, our students engage in concentrated practical application of therapeutic methods at four hospitals in this medical center before being permitted to take the New York State licensing examination for physical therapists. The complete 4-year program is under the direction of an eminent doctor of physical medicine, Arthur S. Abramson.

Most of our graduates from the School of Health and Physical Education are in the fields of physical education and recreation. The emphasis there, as you know, is on fitness and prevention, rather than

rehabilitation.

Our physical therapists, on the other hand, under medical supervision, specialize in rehabilitation, particurally in the area of crippling

diseases and injury.

There is definite need for adequately trained physical therapists and we, as well as other colleges, want to train and develop more of them. Our problem, however, is a simple one. We do not have enough adequate facilities or equipment to train more students than we have now. Financial aid is becoming more available in the field of the national and physical sciences, the social sciences and the humanities. Unfortunately, this is not so in the areas of physical therapy and

physical education. It does not seem likely that such aid will be forthcoming to schools such as ours, which is a private, nonendowed, completely self-supporting college, unless it comes from the Federal Government.

We need financial aid for additional plant facilities, workshops in

physical therapy, and recreation, and for therapeutic equipment.

Legislation enacted by the Congress in these areas will be welcomed. Ithaca College is a fully accredited liberal arts college. However, our experience in special education dates back to 1892, the year of our founding, and includes education in the fields of music, drama, television, and radio as well as the aforementioned speech, physical therapy, physical education, and recreation.

Mr. Егллотт. Thank you very much.

Are there any questions?

If not, our next witness is Mr. Sol Tapper of the Parent-Teacher

Association, School for the Deaf and Hard of Hearing.

Mr. Tapper, may I urge that you summarize your views and opinions with reference to this matter, and then that your statement in writing be given to us within 10 days, if you do not have it ready at this time.

STATEMENT OF SOL TAPPER, PARENT-TEACHER ASSOCIATION, SCHOOL FOR THE DEAF AND HARD OF HEARING, JUNIOR HIGH SCHOOL 47

Mr. TAPPER. I have not any prepared text. I think I could summarize the picture and the viewpoint of the PTA of Junior High School 47.

Mr. Elliott. Thank you.

Mr. TAPPER. I represent the PTA of Junior High School 47, which I consider and I think is the laregst deaf school in the United States. It is known as a junior high school but it starts with children at three and a half, pretraining, until they are ready to enter high school level.

Actually, the witness you had from St. Mary's School for the Deaf was an excellent witness in outlining the situation and the prob-

lems of a deaf child.

I think the résumé presented to the committee really brought out

the actual problems that a deaf child has.

I believe Representative Daniels, from New Jersey, this morning questioned a witness and asked the difference between a speaking child, the one that has oral speech, and the number that are completely deaf, that cannot give any type of speech. I did not get the answer that the witness rendered, but, at the outset, I would like to state that there is a vast difference between a child that is born deaf and one that becomes deaf later in life. A child that is born deaf, that never did have any type of hearing, or could not hear sound, is a far greater problem than a hard of-hearing child.

There is a vast difference between a deaf child and a hard-of-hear-

ing child.

Federal aid we believe can help, and where we find the greatest shortage, is in the teachers of the deaf. There are not enough of them. The Federal Government can aid them in some sort of a plan whereby they can scholarship teachers or induce them to enter this field.

There is a shortage of speech pathologists which are sadly needed. Audiologists are needed, as well as psychiatrists and psychologists.

I do not know if it is within the committee's jurisdiction, and from what I read in the bill, it is not in there, but I also consider that the training of the deaf is made by a team, a team of teachers, audiologists, psychologists, and psychiatrists. There is a vast shortage of psychologists and psychiatrists, very few that know the problems of a deaf child or are cognizant of them. They should be associated at a deaf school, trained at a deaf school to know what problems this child will reach when he reaches maturity, and be able to guide parents, mainly, and the child, to live a normal and healthy life.

House Joint Resolutions 494 and 316 cover a good portion. The PTA is for it. We are very happy to see that the Federal Government is stepping into the picture of rendering some sort of aid.

Another thing that we feel they can also render would be training films that can be distributed to parent-teacher associations. We find that the parents can do a lot with a deaf child at home. They can aid the teachers with that. His life at home has to be a normal existence because the deaf child has to live in a normal world. He has to be integrated. If he is shunted and moved around from situations and place to place, it is wrong.

Training films and literature by the parent can aid this child at home, would aid all the teachers and all the psychologists just as well

and cut down the problem of psychiatric care later on.

In the rehabilitation field, the problem has always been what happens to the deaf child when he is graduated or when he finishes his formal training at a school.

H.R. 3465 includes, I notice, the deaf with the other physically handicapped. In my estimation, there has been very, very little done

for the deaf person after he does leave his formal training.

What will he do in his normal life? What field of endeavor will

he enter into?

The Federal Government can, I believe, aid in working with State rehabilitation groups, to survey the field of private industry, educate private industry to accept these physically handicapped deaf people, what types of jobs they can do, whereby communication or their speech will not hinder them in any way.

There is a lot of work to be done in that field, where later on they can go on and earn a fair living and have a regular place in the world.

Maybe the Federal services can be surveyed to see what type of jobs can be opened up to deaf individuals, where the physically handicapped portion can be eliminated, where they can compete with normal hearing people for certain types of jobs.

There is where I believe the committee can aid greatly in helping

the deaf person.

In closing, all I can say is to thank the committee and bring the thanks of the parents of the Junior High School 47, and maybe I will say the parents of all deaf children. They are quite happy to see that

legislation is on its way to aid in this field that we believe was forgotten for quite a number of years.

Mr. Elliott. Thank you very much, Mr. Tapper.

Your testimony will be very helpful. We appreciate it.

Our next witness is Mrs. Shirley Kurs.

Is Mrs. Shirley Kurs here?

If not, our next witness is Mr. B. Scher.

Mr. Scher is the executive director of the Girls' Service League. If he is not here, the next witness is Mr. A. W. Sherman, executive director, The Lighthouse, New York Association for the Blind.

Is Mrs. Alma W. Fraas here?

STATEMENT OF MRS. ALMA W. FRAAS, ADMINISTRATIVE ASSIST-ANT, IN BEHALF OF A. W. SHERMAN, EXECUTIVE DIRECTOR, THE LIGHTHOUSE, NEW YORK ASSOCIATION FOR THE BLIND

Mrs. Fraas. I am Mr. Sherman's administrative assistant. He

asked that I file his statement with the committee.

Mr. Elliott. Without objection, the statement mentioned by the assistant to Mr. Sherman, will be made a part of the record at this point.

(The statement referred to follows:)

STATEMENT BY ALLAN W. SHERMAN, EXECUTIVE DIRECTOR, THE NEW YORK ASSOCIATION FOR THE BLIND

Mr. Chairman and gentleman, the following material has been prepared by members of the professional staff of the New York Association for the Blind as the result of many years of practical experience in providing services to 5,000 blind people each year. It is respectfully submitted for consideration by your committee.

I. EMPLOYMENT OPPORTUNITIES NEEDED FOR BLIND PEOPLE

In spite of the great progress made in securing acceptance of properly trained blind persons in the labor market there will remain many areas where employment could and should be extended. Some of these needs are as follows:

1. Placement of professionaly trained blind persons.—In order to fully utilize the abilities of blind persons with ability, study of those already in professional or semiprofessional positions needs to be made to secure a body of knowledge about such opportunities which would then be useful in counseling those persons contemplating advanced study and which would be essential in helping these trained individuals in suitable job placement.

Because this is a nationwide need and problem, Federal funds would be helpful in providing the study indicated and in stimulating greater activity in this

area.

2. Examination of civil service laws and other "discriminatory regulations."—Many public positions, both Federal and State, requiring professional training, often come under civil-service laws and regulations. Changes may be necessary to make these opportunities a reality for qualified blind persons. Civil-service and other requirements should not be discriminatory against blindness. The emphasis should be placed on qualifications and abilities, not on disabilities. The solution of this problem may require legislation, but as a study it would include both Federal and State discriminatory laws and regulations. Such a study, because of its broadness, could best be financed through Federal grantsin-aid.

3. Placement agents and counseling services needed.—Standards for counseling and placement services for blind persons should be raised and opportunities for training stimulated and traineeship programs broadened and extended. While much has been accomplished in this area under Public Law 565, more needs to be done. A key factor in this area would be the establishment in State

programs of work opportunities with pay scales commensurate with the importance of these jobs and the training required. To stimulate such raising of standards and compensation rates, grants-in-aid to cover such administrative costs which meet standards that have been agreed upon and set should be con-

sidered.

4. Employment services and opportunities for homebound blind persons.—One of the most difficult yet challenging problems in work for the blind are adequate programs to provide employment opportunities for blind persons who are homebound. In a great urban area such as New York there is great need for such opportunities under proper regulations. Following a pilot study done in a rural area, there needs to be a pilot project in an urban area. This might best be done under the auspices of a voluntary agency and should probably utilize other handicapped individuals as well as blind persons. Because of the heavy cost of such a program, only through the encouragement of substantial Federal grantsin-aid would agencies be enable to enter into such an important project.

5. Piano tuning and repairing.—There is still a good opportunity in this type of work for properly trained blind persons. What is needed are training centers, equipment and staff to produce well trained tuners and repair men. Federal grants to voluntary agencies or educational institutions would stimulate the development of centers for training in this technical, practical, job opportunity.

II. EMPLOYMENT PROBLEMS RELATED TO WORKSHOP

Workshops have become an integral and important part of rehabilitation and employment services. It is generally agreed that workshops fulfill two objectives: (1) training and (2) providing terminal employment of less skilled persons, multiple-handicapped and older persons.

As training facilities, workshops are a part of an overall program of service to blind persons. The objective of training programs should be to place qualified blind persons in the competitive labor market through selective place-

ment.

For those workshops providing terminal employment, there is need for modernizing programs in order to increase the productivity of such persons to

enable them to earn more adequate wages.

The Wagner-O'Day Act has helped considerably in workshop programs for blind persons. Public Law 565 has helped some in the development of workshop facilities. Now and in the future there is a great need to stimulate and help workshops raise their level of operation through studies of manufacturing processes, marketing and product research. This is a very difficult area of work and for too long we have been satisfied with the manufacture of products which have come to be related to stereotypes of blindness. The workshops which now are having to work with persons with little ability are still having such people engage in "craft type" operations in which a high level of skill is not required. This results not only in poor work but in meager production which can only produce low wage rates.

Workshops must be encouraged to provide working conditions which will permit maximum efficiency, using the most modern manufacturing techniques and automatic devices in order to increase the productivity of this labor. This will require research and study and the utilization of engineering and technical skills which a single workshop will find it difficult to afford. Therefore, it is urged that Federal funds be made available to stimulate and assist progressive workshops or even the National Industries for the Blind in moving ahead in

this important area.

A corollary to such a program would be the training of foremen, supervisors, and administrators for such workshop programs.

III. MEETING THE NEEDS OF OLDER PERSONS

While voluntary agencies such as the Lighthouse, the Industrial Home for the Blind, and the New York Guild for the Jewish Blind, have for many years provided programs of service for older blind persons in an effective way, stimulation should be given to increased activities in this area which would help to raise the standards of rehabilitation for this group which constitutes the majority of the blind population. The use of centered and field work programs for providing such services should be encouraged and services should be at a

higher level. Our conception of rehabilitation for this group should include

provisions for self-care and more independent living.

There is need for improvement of facilities for those blind persons who are also chronically ill. We are not suggesting segregated facilities for them but rather a way to provide staff in existing hospitals for the chronically ill to serve persons who are blind.

IV. PUBLIC LAW 565

This law has provided great stimulus for rehabilitation services and pro-We should like to make the following observations and suggestions regarding programs established under this law:

1. Specialized services for blind people.-We sincerely believe in the need for specialized services for blind persons and we urge the retention of such services in States where this has proven to be the best service for blind persons.

2. Financing through the States.—One of the problems which has developed in these programs has been the inability of State programs to adjust to important changes which occur in caseloads. Perhaps a study of the formula through which Federal funds are provided should be worked out so that State programs would be able to adjust more easily to changes in caseloads.

3. Service standards and purchase of service.—Through this law, service standards have been raised in both State and voluntary agencies. As a principle, it is essential that service purchased from voluntary agencies should be

as close to the cost of providing such service as possible.

4. Training blind people for general work.—While it is immediately related to State regulations and sound counseling, we would suggest that opportunities be made to train blind people for general work as well as for specific jobs.

5. Elimination of delays.—We need to eliminate the delays between the time vocational objectives have been established and the date of authorization.

6. Case loads.—A study of projected case loads would indicate a need for expansion of these programs under Public Law 565.

V. LAWS RELATING TO VENDING STANDS

Operation of vending stands has proven to be one of the most feasible business opportunities for proper qualified and trained blind persons. The legislation which provides help to blind persons in this area of employment needs to be carefully studied and brought into line with existing realities in such a way as to protect the interest of blind persons. Such areas as the following are—

1. What shall be the relationship between the vending-stand program for blind persons and other programs of General Services Administration?

2. How should the vending-machine program be handled by State and voluntary agencies engaged in vending-stand programs?

3. Can some provisions be made for the purchase of existing small businesses to provide an opportunity for qualified blind persons?

VI. SUGGESTED REVISIONS OF THE SOCIAL SECURITY ACT

While such matters may not be considered within the work of this committee, the following areas of need are indicated because of their importance to persons who are now blind or who may lose their slight in the future:

1. Amendment to title II .- An amendment to title II of the Social Security Act to provide disability insurance payment to persons who lose their sight would be desirable. We are fully in agreement with the provisions for such amendment as are embodied in the Anfusco bill (H.R. 8218) and the Bosch bill (H.R. 8219).

2. Revision of title X.—This section of the Social Security Act, relating to the program for aid to blind people through the State should be revised in order more adequately to meet the special needs of these people and to reduce

as much as possible the pauperizing effect of the present law.

To bring this about we suggest that more adequate and frequent review be made of individual persons by staff and supervisors trained in working with blind persons. We recognize the practical implications and problems of such a recommendation, but much stimulation could be given to the adequacy of training of public welfare workers.

It is suggested that the limit be raised for individuals on real property, real estate, savings, and insurance in accordance with some formula to be determined which will enable blind persons, particularly older blind people, to retain some

of the results of their labors during their productive years.

3. Revise section devoted to "carned income" (title X).—A revision of this part of the Social Security Act should be made to encourage blind persons now on relief to engage in employment to the end that they would eventually become self-sustaining.

The \$50 of earned income now exempt from being considered as a resource has helped to encourage blind persons to work, but this does not go far enough beause it does not enable the blind person to reach the point where he is able to leave public-assistance rolls. We suggest amendment of these provisions to establish a sliding scale so that a blind person might retain at least 50 percent of his earnings up to a maximum of \$1,200.

Mr. Elliott. Our next witness is Dr. J. A. Brussel, assistant commissioner, Department of Mental Hygiene, State of New York.

STATEMENT OF DR. J. A. BRUSSEL, ASSISTANT COMMISSIONER, DEPARTMENT OF MENTAL HYGIENE, STATE OF NEW YORK

Mr. Elliott. Dr. Brussel, you may summarize your statement with the understanding that it will be filed when you are finished.

Dr. Brussel. Mr. Chairman and gentlemen, thank you very much for the privilege and honor of appearing before your committee.

The subject of special education as encompassed in H.R. 3465 and S. 772 has a specific implication for those of us who deal with the mentally ill and the mentally retarded, particularly from the stand-

point of institutionalization.

Present mental hygiene statistics, taking into account therapeutic progress and the projection of mortality tables, plainly indicate that within a decade our institutions will be housing only the very young and the very old. Therefore, it is obvious that two problems will be manifold as time progresses: the institutional care and treatment of

youth and old age.

First, the question of the elderly. It is estimated that in the next 15 years, out of a total population of 200 million, somewhere in the neighborhood of 35 million citizens will be in the 60-and-over age bracket. Psychiatry of itself is not the exclusive answer to the everincreasing geriatric challenge in this country. Nor are recreation centers, specially designed living quarters, and doles the panaceas. The oldsters who regard leisure and retirement as synonymous with inactivity and fail to find gainful employment, feel rejected and inferior and swiftly are imbued with overwhelming depression and a sense of futility. It is one thing to speak of psychiatric rehabilitation and reeducation. For what is the aged person being rehabilitated and/or reeducated? Many individuals over the age of 65 are physically, mentally, and emotionally equipped to carry on work they had been doing in earlier years with comparable efficiency-or, to easily learn The immediate inference and perform a new trade or occupation. would seem to be rehabilitation and reeducation.

Mr. Elliott. It is rather cruel, is it not, Doctor, that we practically drive people from the work force who are 65 years of age, when, as you said, in many instances they are at the height of their powers.

Dr. Brussel. That is correct, sir.

But these oldsters cannot find work. Our ever-increasing social consciousness benefiting it superficially promises, actually guarantees,

that the elderly should not be hired because, for example, social security benefits are available for men and women at 65 and 62 respectively. Similarly, it is a well-known fact that employers, with rare exception, are averse to hiring applicants over the age of 50, and more usually,

Considering the staggering challenge of old age, it appears that rehabilitation and reeducation, per se, are not the answers. Gainful employment, to counteract the lack of hope in these elderly persons, is of paramount importance. Otherwise, unable to hold up their heads, to face senility with hope and self-respect, nothing but depression, futility, and enforced dependence on a handout become the prime factors accounting for the ever-increasing numbers of the aged who suffer with mental and emotional disorders. Thirty years ago only 2.5 percent of all first admissions to mental institutions were in the over-60 age bracket. Today this group is in excess of 40 percent of all first admissions.

In the field of the very young, one must contemplate the devastating problem of juvenile delinquency in which emotional disorders play a prominent role. Statistics, as furnished by the New York State Department of Mental Hygiene, plainly indicate a marked relative and absolute increase in child psychiatry with a large component of behavior disorders. It is felt that we must have far more community psychiatric facilities, probably started in a pilot project, as we suggest,

established in urban localities than are available today.

Rapidly rising juvenile delinquency is uncovering more and more youngsters with mental and emotional disorders who require hospital treatment. This automatically implies a demand for increased educational facilities within such institutions, but these cannot be mere carbon copies of ordinary schools within the community. Principals and teachers must be fortified with special training in the handling of these youngsters.

Similarly, since it is obvious that few of these children are endowed with the mental and emotional capacity to pursue higher academic education, the institutions caring for these youngsters should have a wide range of vocational training modalities as a major facet of the education program. Education would, of course, be combined with

psychotherapy.

It should be recognized that juvenile delinquency is an expression of the youngsters' resentment of, disregard for, or rebellion against authority—the teacher, the policeman, et cetera. It is recognized that the lack of esteem for authority is directly traceable to the home where the child should have first learned his respect for authority, i.e., the

parent.

Obviously, the question arises as to where therapy and education should be administered. The permissive atmosphere of a mental hospital is frustrating to those who wish to treat these youngsters. The primary difficulty to be overcome is the seeming disregard for, and/or hostility toward, authority. Neither coddling nor the best oriented therapeutic or educational program will materially alter such social deviants. But this program of psychiatric treatment, education, group activity, vocational training, et cetera, will be far more effective in a milieu where discipline can be enforced, where it is statutorily permissible to punish as well as to reward. Strict

discipline and humane punitive measures cannot be followed in a mental institution; they can, however, within a correctional setting.

An ever-increasing problem is encountered in the field of mental retardation, the numbers of which are mounting at an appalling rate. Formerly, for example, mongolians and mongoloid infants seldom survived the age of 2 because of fatal intercurrent infections. Today, thanks to antibiotics, these children are living and attaining advanced age.

If any funds are to be appropriated for the training and education of mentally retarded children, this speaker feels that to do so would be

taking a potshot in the dark.

Research and investigation are more important, if we are to properly spend tax money for the purpose of battling the challenge of mental retardation. Certainly an attempt to discover the cause or causes of mental retardation, with a view of prevention, is a scientifically sound approach.

Likewise, a survey to discover in what areas mental retardation is

more acute than in others, is also indicated.

In New York City alone, 3,000 to 4,000 mentally retarded infants are born every year. It is estimated that 3 percent of the American population is mentally deficient. However, if "borderline" intelligence is included—an IQ range of 70 to 75—that figure becomes 4 percent. It is amazing, nevertheless, that only three one-hundredths of

1 percent of all grades are institutionalized.

It is interesting to note how this hospitalized group is distributed in the three categories of mental deficiency—considering intelligence level only for this immediate presentation—because an appreciation of this clinical-statistical phenomenon must influence the approach to-therapy, on which lay and medical authorities differ, as we shall see. The distribution of the hospitalized defectives is as follows:

Percent of total:	IQ range
30	0-19
50	20-49
20	50-70

It is more advantageous and helpful in any plan to regard mental defectives as the acutely retarded who are totally dependent, moderately retarded who are trainable, and mildly retarded who are educable.

The overwhelming bulk of hospitalized defectives is the severely and mentally retarded groups. They present, primarily, physical and psychiatric handicaps. Only a very small number are in institutions for academic training.

This, then, is the irrefutable answer to well-meaning but uninformed groups who believe the panacea for institutionalized defectives is spe-

cial education.

P

It appears to this writer that special centers, within the community for the education of mildly mentally retarded children, is far more preferable. While supervision of such centers should be under the jurisdiction of local boards of education, planning, guidance, and consultation should be provided by psychiatrists and those skilled and experienced in the approach to the treatment of mental retardation.

Thank you, sir.

Mr. Elliott. Thank you very much, Dr. Brussel, for a very helpful statement.

I recognize the gentleman from North Carolina.

Mr. BARDEN. I did not have a question, but I wanted the record to carry this as a reminder to all of us: Of course, I have been interested in this rehabilitation for many years, but there is the practice grown up in the Government at this time which disturbs me. I know it is the practice in Navy installations where they have these repair shops and so forth. That is, in spite of the fact that every year the President issues a proclamation to the Nation encouraging the employment of the physically handicapped, yet the practice is that if, upon a physical examination, they find a man physically handicapped, maybe the doctor will say that he cannot climb high ladders, and he is a painter, that he cannot do that, they just fire him and recommend that private employment take him up. The whole building has to be painted, and it would make better sense to me if they put him to work painting the lower part of the building and let those who can climb the high ladder paint the top of the building, rather than fire him. Nevertheless, they will do that. Of course, if the disability did not arise as a result of his work, he is thrown out without any compensation, and private employment is not very ready to take him, maybe one or two painters. unless the painter can paint the whole building.

It does not make any sense to me for the Congress to pass every kind of law that we could figure out would be helpful up to now, and it be the policy of the Government to encourage the employment of the physically handicapped, if one department of the Navy just takes off in the other direction and fires anybody they can unless he is 100-

percent efficient.

Dr. Brussel. Mr. Barden, there can be a more useful generalized principle to assist in the point you are trying to make, and that is if each individual was inventoried for his assets rather than his liabilities, then those assets might well be exploited for the mutual benefit of the individual himself and for the service.

Mr. Barden. Of course, he could be.

I have been in the same shop, and the chairman knows what I am referring to, with some 4,000 employees, where part of them did work sitting at a table. Yet, if they find one of those that cannot do the work that is 'way up high, or something like that, instead of letting some man at the table who is capable of doing it do the other work and

put the first man at the table, they just fire him.

I will close my statement by saying that I think if the one responsible for setting the policy in the Navy Department for the civilian personnel was called before the committee to explain just why that happens, I believe it would be a start toward the changing of policy. I think it has just been permitted to continue. But living right near one of these bases, I am becoming pretty sensitive to it because about half a dozen a week come to see me to see if I cannot get them back. You know about what chance that is when some doctor says, "No, he should not climb a ladder," and the colonel says, "If he cannot climb a ladder, fire him." That is it.

Mr. Elliott. Thank you very much, Mr. Barden.

Thank you, Dr. Brussel. Dr. Brussel. Thank you.

Mr. Elliott. Our next witness is Miss H. F. McLaughlin, principal, Board of Education of New York City, Junior High School 47.

I hope you will summarize your statement, Miss McLaughlin. If

you will, we will be grateful.

You may proceed.

STATEMENT OF MISS H. F. McLAUGHLIN, PRINCIPAL, BOARD OF EDUÇATION OF NEW YORK CITY, JUNIOR HIGH SCHOOL 47

Miss McLaughlin. We are very grateful that you are interested in this problem of teaching the deaf, and that you are going to use your

efforts to do something about it.

We heartily endorse your bill for a teacher training program and hope that it will contain some incentives to encourage people to go into this very difficult area of teaching, with scholarships to carry on their training.

In addition to this, we find a few other unmet needs that are very important in this field. There is a lack of adequate diagnostic facilities in examining children who present multiple problems so that proper recommendations for an educational placement can be made.

The team needed for this project would include a psychiatrist, psychologist, social worker, and a secretary, as well as members of

various medical and teaching groups concerned.

There has been a noticeable growth in the number of atypical children over the last few years. We know so much more now about hearing than we did 20 years ago, and about other factors. We did not know about the Rh factor 20 years ago, and that it resulted in deafness and in destroying other areas of the brain.

The rate of infant mortality has declined in the last 50 years; 90 percent of the babies who used to have meningitis died from it. Now 90 percent live. As a result of the drugs that are used in this, they are brain damaged, deaf, mentally retarded, or have some other ail-

ment.

You heard from the gentleman who spoke before me of the problems of the mentally retarded. I assure you the mentally retarded deaf present a much bigger problem. It is very, very difficult to reach them.

We have so many premature babies. That is all anoxia and that results in deafness. We did not know about that some years ago.

We have a great deal more knowledge about the workings of the ear and the brain than we used to have, and there have been many revealing developments in measuring hearing. We know now that very few babies, if any, are born totally deaf, and this little residual of hearing that they have can be stimulated from very early in life, and then they become more like hard of hearing children than like deaf children, when they do not grow up in an entirely silent world.

Many such children apply to my organization for admission. My concern is to find out just what the problem is and what the proper educational program should be for them and where that exists.

Another unmet need is a pilot project in prevocational training and testing for these multiple handicapped children. We work very closely with the Bureau of Vocational Rehabilitation, and they say they will train these children for us if we tell them what they can do. We do not know what the child is able to do, what a mentally retarded

deaf child can do. But we think of a pilot project set up in a large area such as New York City, in that the results would benefit similar children all over the country. We have more because of being in the metropolitan area. Beyond that, there are very few places that have readily available information to help older deaf.

I have problems presented to me all the time from different organi-

zations and from parents of children who have left the school.

One such problem, to illustrate, would be a hospital might call up and say that "a deaf woman is going home with a newborn baby. What about that baby when it cries at night? She will not be able to hear it."

Well, there is an equipment, something that has been invented, with a little microphone that hangs over a baby's crib, and a wire that lights the light at the mother's bed and flashes the light on and off so that she will wake up and tend to the baby. But there are not many

deaf who know about that.

I would like to see a regional office set up in different large areas, like Los Angeles, Chicago, New York, where many of these problems, such as that type of problem, or social security information, or other information that the deaf need, could be made available to them, because they are a very isolated group.

To make, of course, all these problems improve, we need research in

this area.

Thank you very much.

Mr. Elliott. Thank you, Miss McLaughlin.

(The following statement was submitted by Miss McLaughlin:)

STATEMENT BY MISS H. F. McLAUGHLIN, PRINCIPAL, BOARD OF EDUCATION OF NEW YORK CITY, JUNIOR HIGH SCHOOL 47

Gentlemen, educators of the deaf are very grateful to you for your interest in this field of education and for your efforts to help. Teaching the deaf is acknowledged to be the most difficult pedagogical problem with the single exception of the deaf and blind. I shall list a few of the unmet needs.

I. A TEACHER TRAINING PROBLEM

We heartily endorse your proposal as described in House Joint Resolution 494 (86th Cong., 1st sess.) to evolve and carry forward a planned, structured, training program for teachers and audiologists. While we are aware of the calue of this proposal to training centers throughout the country, in New York City we have no difficulty in obtaining training under the New York State fifth-year program. Our problem is one of recruitment. Unless some salary incentive is made available, candidates will continue to be unavailable in this very difficult area of teaching. Out of 96 teaching positions in the school where I serve, only 41 teachers are licensed teachers of the deaf.

May I point out here the need for incorporating into the final bill—training other people to work with deaf children if the school program is to function successfully. These include social workers, psychologists, and psychiatrists who

are oriented to the handicap of deafness.

Section 106(a): The suggested appropriation of \$1,500,000 for the year 1950-60 appears to be somewhat inadequate for a total program of training sufficient teachers of the deaf. Along with maintaining scholarships (for which the cost is increasing), there is research needed to evaluate these programs, there is a need for increased personnel for training and administrative purposes, and a need for more adequate facilities including equipment to be utilized in these training programs.

II. LACK OF ADEQUATE DIAGNOSTIC FACILITIES

Lack of adequate diagnostic facilities in examining children who present multiple problems so that proper recommendations for educational placement may result. The team needed for this project would include a psychiatrist, a psychologist, a social worker, and a secretary—as well as members of various medical and teaching groups concerned. The problem of differential diagnosis is a very important one. We have found that final and proper educational placement can sometimes be made only after trial in a group. Teachers' opinion helps to clarify some elements of diagnosis. A pilot study (class) should be set up as a part of this project.

There has been a noticeable growth in the number of atypical children—one of whose problems may be deafness. Some of the reasons for this increase are:

(a) Rate of infant mortality has declined during the last 50 years. Formerly 90 percent of children who contracted meningitis died. Now more than 90 percent live but, due to chemotherapy, these children may have many difficulties. Twenty years ago the RH factor was unknown. Now these children live and are found to be brain-damaged, aphasic, deaf, or have other problems.

Anoxia at birth: These children are often not responsive to sound at an early age. Later they may or may not be able to perceive or conceptualizes. Supervirsuses cause central damages. Some children learn to inhibit sound because it is not meaningful. There may be no damage to hearing mecha-

nism in these cases.

(b) Tremendous increase of knowledge of auditory system.

(c) Many revealing developments in measuring.

A basic question is not how much they hear but how they hear. If trained early enough with hearing aids, they may become hard of hearing rather than deaf. Insulation of nerves may change with proper and early stimulation. It is difficult to distinguish between disfunction and retardation.

Money should be made available for research with the rapidly growing num-

ber of atypical children throughout the country.

Many such children apply for admission to my organization. My concern is to find out just what is the problem, and whether there is an education program to fit their needs.

TII. PILOT PROJECT IN PREVOCATIONAL TRAINING AND TESTING

A program to determine the job potential of aphasic, mentally retarded deaf, and others with special problems. This would involve an exploratory training program in various vocational areas on a very elementary level. The New York State Division of Vocational Rehabilitation will undertake the training of the handicapped if we can tell them in what areas there is a possibility of success. This should be considered a laboratory not just a special study.

Any results obtained from such a project would benefit students with similar handicaps in other parts of the country. New York City is an ideal place to carry on such an experiment because of the numbers of students available in

a large metropolitan area.

IV. REGIONAL CENTERS FOR ADULT DEAF

There is great need for centers to be set up in areas throughout the country where deaf adults may go, or may be referred, for help in a large variety of areas other than vocational training which is ably handled by the division of vocational rehabilitation. These regional centers should be equipped with personnel to handle psychological, matrimonial, religious, legal, housing, communication, unemployment, social security, and all informational questions related to the deaf.

Such regional centers might well be a vital part of the bill H.R. 3465 (86th Cong., 1st sess.), pointed toward assisting handicapped persons to achieve in-

dependent living.

Our organization receives requests continually from former students, parents of former students, the general public, divisions of the New York City Board of Education, and outside agencies for information.

A few examples of recent, simple, but vitally necessary, information follow:

1. Visit from a parent of a former student who stated that she had awakened her son daily so he would get to work on time. Now he is to be married to a deaf girl. How can he be awakened on time?

We told her about various devices, such as an alarm clock with an attachment to the bedspring. When the alarm goes off, the bed shakes until the alarm

is turned off.

2. Request from a district superintendent in Brooklyn for someone to be present at a hearing of a delinquent, vocational high-school student, to be held this current week. The parents of the boy are deaf and it is necessary for someone to see that they understand the charges, and be able to communicate their testimony.

3. A telephone call from a hospital seeking help. A deaf mother is returning home with her new baby. If the baby cries, especially at night, the mother

will not hear it.

We explained that there is an electronic device consisting of a microphone attached to the baby's crib with a wire strug to a lamp which shines on the mother's bed. When the baby cries, the lamp light up and continues to flash. The cost is \$60. In cases of need, the regional office should be able to provide such equipment.

Thank you for the privilege of testifying.

Mr. Elliott. Our next witness is Dr. Paul H. Hoch, commissioner,

Department of Mental Hygiene, State of New York.

Dr. Elliott. Dr. Hoch wrote you a letter stating that, because of the departmental budget hearings this afternoon, he could not be here, but he asked me to come representing the division.

Mr. Elliott. And what is your name, please?

STATEMENT OF DR. HELEN ELLIOTT, DEPUTY ASSISTANT COMMISSIONER, DIVISION OF MEDICAL SERVICES AND RESEARCH, ON BEHALF OF DR. PAUL H. HOCH, COMMISSIONER, DEPARTMENT OF MENTAL HYGIENE, STATE OF NEW YORK

Dr. Elliott. I am Helen Elliott. I am deputy assistant commissioner, Division of Medical Services and Research, Department of Mental Hygiene, State of New York.

Mental Hygiene, State of New York.

Mr. Elliott. You may proceed, Dr. Elliott. If you will summarize your statement, we will appreciate it. That will be with the under-

standing that it will be made a part of the record in full.

Dr. Elliott. I will be glad to send it later.

Since the Department of Mental Hygiene of New York State may be considered as an operation in psychiatric rehabilitation, this hearing of the Subcommittee on Special Education we consider of vital

importance to us.

The problem of rehabilitation is perhaps more prominent in connection with psychiatric disorders than in many other areas of medical practice, on account of the multiple practices involved and the various symptom complexes with their mental and emotional items, which often endanger a sense of rejection and social stigma on the part of both the public and the patient.

Rehabilitation is implicit in the goals of the treatment program of the department of mental hygiene. This is implemented by an orientation throughout all our personnel to the concept that the activities are directed to returning the patients to the community as an active

participant in the functions of society.

The program must be sufficiently comprehensive to cover every age group, practically every type of problem, and at the same time flexible enough to meet the needs and potential assets of the individuals

The Rehabilitation Act of 1959 would provide for the furtherance of this purpose in areas of unusual concern to us. Specifically, at present, a considerable number of the 560 adolescents in the age group

16 to 19 who annually are placed in the community from the mental hospitals in the department of mental hygiene and the 250 in the same age group who are released from the State schools and hospitals for the retarded, often enter society under handicaps and encounter difficulties and hindrances in their adjustment that result in social maladjustments requiring reinstitutionization.

It is our opinion that this should be evaluated fully to its conclusion to solving the problem of this group and of the much larger group of

the young psychiatric problem cases in the community.

Such a pilot program would include community-based sheltered workshops, day care centers, vocationally oriented, and halfway houses for brief residential care, all with integrated psychiatric services.

Such resources, separate as to physical plants but identical and appropriate psychiatric services, should be also provided and available for the mentally retarded educable in the community, and the delinquent in this age group. Thus, for those groups, there would be provided a way to economic and socially responsible citizenship.

The inclusion of the latter group, the delinquent adolescent, is an expression of our concern for those of this age group who have given indications of a social ill and the precursor in our department for such service is our present services to the Department of Corrections, New

York State.

With the purpose of preventing institutionalization of retarded individuals in the employable age group, a particular need is service for rural and semirural areas in the establishment of occupational training centers to provide model short-term training, under psychiatric supervision.

These should be in conjunction with community residential facilities to provide maintenance during the time the individual is away from home. Their establishment in national centers of the population of

the areas served is recommended.

There appears to be a need for a more extensive program of vocational rehabilitation integrated with the program of in-patient psychiatric services.

This also needs critical evaluation and might well develop as a greatly extended system of sheltered workshops and vocational coun-

seling and rehabilitation.

Preliminary experience has already been had with sheltered workshops in our department. Two of these are at present in operation in State mental hospitals; that is, within the hospital, and enabling legislation for the establishment and maintenance of sheltered workshops in State institutions, for the department of mental hygiene, is contained in chapter 394 of the New York State laws of 1959.

The sheltered workshop at the Manhattan State Hospital was set up under OM-228, of the Department of Health, Education, and Welfare, National Institutes of Health, to the research division of the Manhattan State Hospital, and is designed to evaluate by scientific study the influence of meaningful work on the patient's hospitalization

and subsequent course.

These initial ventures provide a baseline for our suggested projects.

Prominent in any consideration of services for former mental hospital patients living in the community are those persons whose adjust-

ment is tenuous, due to factors of environmental and economic stress. These are usually concentrated in the large cities, and statistically there are one-quarter to one-third more women than men in this category. Their need for vocational evaluation and training services is urgent and vital.

Of deep concern are those of the 17,000 patients who are convalescing

in the community at any one time from our hospitals.

The division of the research unit at the Manhattan clinic has an ongoing study under grant No. SP-176 from the Office of Vocational Rehabilitation, and this is relevant to the subject. In the report of the director of interim program, it showed that 28 percent of the patients in this study met the criteria for referral to the division of vocational rehabilitation. It is thought that 7 percent of all released patients could benefit materially by the establishment of a halfway house, to relieve environmental pressures which militate against their adjustment to competitive employment and community living.

The pattern under which this study has been set up in the Manhattan clinic is illustrative of the close and continuing collaboration of a representative of the division of rehabilitation, and the treating psychiatrist is one that might well be duplicated in other proposed projections.

ects.

To determine the most effective ways of using the techniques developed and the knowledge gained by the proposed pilot programs, it is essential that each pilot project design have ability in measure of its merit, including its applicability to all areas of the State as well as efficiency and economy.

Through the provisions of the Community Mental Health Services Act of New York State, which provides for the granting of State aid for approved mental health services, psychiatric rehabilitation services may be developed, expanded, and evaluated under local auspices.

The department of mental hygiene deeply appreciates the opportunity to testify at this hearing, especially so if the bill is enacted. The psychotherapeutic techniques in use in the department may be

well agumented by the gains made in the range of the pilot program.

Thank you, gentlemen.

Mr. Elliott. Thank you very much, Dr. Elliott.

Our next witness is Dr. M. Schmideberg, director of Clinical Serv-

ices Association for Psychiatric Treatment of Offenders.

If she is not here, our next witness will be Dr. S. Zwerling, Coordinating Council of the First District Branch of the Medical Society of New York City.

Dr. Zwerling, you may proceed.

STATEMENT OF DR. S. ZWERLING, DIRECTOR, COORDINATING COUNCIL, FIRST DISTRICT BRANCH, COUNTY MEDICAL SOCIETIES OF GREATER NEW YORK

Dr. Zwerling. Mr. Chairman, committee members, it is a privilege to appear before your committee as a representative of the Coordinating Council of the County Medical Societies of Greater New York.

I fear that my interest in the subject far exceeds my professional abilities. However, I would like to state the position of the physician at large, and particularly the otologists, pediatricians, and psychia-

trists. We are increasingly interested in the education and rehabilitation of the hearing handicapped, and indeed in the early detection of hearing impairment. With equal interest we appear before this committee for help in maintaining the facilities now available and increasing the facilities to meet the needs where speech and hearing centers are not available.

Our interest today lies in the patient who comes to us with an irreversible hearing loss—the patient who requires education and the allover problem of rehabilitation. Although there are facilities available in the New York area which provide these services, these centers

and agencies are overtaxed in every department.

At the New York League for the Hard of Hearing the waiting list for hearing aid consultations, for example, is never less than 3 months, although in special instances our hearing aid consultant will stay overtime in cases where a job depends on a properly fitted hearing aid.

Many physicians have very frankly stated that they would be more interested in the examination of these children and adults if they had facilities available where their patients could be referred, and this

with a minimum amount of travel.

The facilities available to us as physicians have long waiting lists. This applies to both public and private schools, institutions, and organizations alike. Since we suspect that about 1 in 10 persons has some degree of hearing impairment, we at once have large numbers of children and adults who may need the services offered by these various agencies.

I have a copy here of the Greater New York Council of Agencies for

the Hearing Impaired which I will leave with your committee.

We are all aware of the growing public and professional interestin the hard-of-hearing individual and the significance of the hearing loss not only to the individual but also to the community. Hearing impairment is a public health problem because of its many facets, its implications, and the great number of people affected by hearing loss.

We are more conscious than ever before of the need for compensatory education for the hearing impaired individuals. We find that more and more people are asking for advice, information, and help on this subject. As an otologist who has been interested in the problems of the hard of hearing for many years, I feel that the facilities for the hearing impaired, particularly those for children, might be better distributed, populationwise, geographically, and also in the sense of their requirements. Therefore, I believe that Government subsidy for present resources is indicated, particularly for the medically indigent.

Only recently I received a "thank you" letter from the mother of two of my little patients, thanking me for sending in my report to the local school requesting lipreading instruction for these two little girls. The mother stated in her letter that as a result of my contact with the school, a lipreading teacher was hired. This is a very fortunate situation for there are many local school systems which make no provision

for the hiring of special teachers.

On the other hand, trained personnel would be hired in some areas were such teachers available. By "trained personnel," I mean public school physicians, speech-and-hearing therapists, teachers in remedial reading, and other areas. At the present time requirements in this

field of education are fairly high. A master of arts degree, with its consequent extra years of study, is almost obligatory and minimal. In some situations a Ph. D. is a requirement. A solution to this lack of trained personnel would be the provision of scholarships for

young people interested in the field.

I believe that in some places the school cannot acquire or expend funds unless there are a specific number of children in the school who require special help. For example, I am informed that there must be more than five hearing-impaired children in a school of 1,000 pupils to justify hiring a speech-and-hearing therapist. As a physician, I cannot imagine having a child wait who needs help until four other children join him in his trouble, whether it be a matter of vision, cardiac, or malnutrition. There must be a way around this.

Could there not be Federal help given in the form of a subsidy for teacher, materials, and space needed for special education for even one child (such as that granted by the Smith-Hughes Act for home

economics)?

There appears to be a lack of coordination among the governmental departments dealing with the needs of the hearing impaired. At present there are at least three departments concerned in this matter, whether it be education, provision of hearing aids, or vocational training. Perhaps this committee could recommend the appointment of a coordinator who would have the authority and funds to ease the way for the hearing-impaired individual. There appears to be a lack of centralized information between not only Government agencies but also between individuals agencies, and schools dealing with our hearing-impaired population. One might say that this is a matter for private or individual effort. On the contrary, however, the Federal Government and public health authorities surely would be in the most favorable position to collect and disseminate this information on request.

Another specific area in which the Federal Government could solve a present need is that of financial assistance to old people—and I am referring to the needs for hearing aids and the cost of upkeep. There is no reason for people on old-age assistance to worry about a hearing aid. They will be better, happier, and more able citizens with a well-fitted hearing aid. At the present time, no one on the subsistence pay allowed by OAA could possibly afford to wear a hearing aid.

Mr. Elliott. What does a hearing aid cost?

Dr. ZWERLING. It varies anywhere from \$100 to \$250, up, depend-

ing upon whether it is one ear or both ears.

The problem of noise poses an occupational hazard. It appears that there ought to be uniform legislation for the prevention of oc-

cupational hearing loss.

The value of lipreading, scientifically taught, cannot be overestimated. I recently saw a patient who came in complaining that his hearing aid was not functioning properly. On checking the situation, the fault lay with the patient and not the aid. He had reached the stage where amplification was of no help, and this because of the progressive deterioration of his hearing. How did we communicate? By writing. Had this man had facilities for lipreading instruction, his problem would not be as catastrophic.

I know from experience, particularly with our local otologists and pediatricians, that they would be more interested in the problems of the hard of hearing and more cooperative if they had adequate facilities for diagnosis and followup for their hard-of-hearing patients.

The otologist, too, requires facilities for consultation, particularly in arriving at a diagnosis qualitative and quantitative, and this espe-

cially in his very young patients.

We need more teachers. We need more workers in the field who will receive an adequate salary as compensation, not only for their labors, but also for their heartaches. Our workers are dedicated men and women who are woefully underpaid and who receive less benefits than do the dishwasher or laborer. Better salaries, better facilities, and more space would, indeed, be an added attraction for students in our field.

Hearing is perhaps our most important sense and, naturally, any marked interference with its functioning will produce difficulties in communication and in adjusting to our environment (Newby, "Audiology," p. 214).

Let us remember that hearing is the most important sense in acquiring knowledge. As an otologist, I ask for help for those dedicated people who come to our assistance when medical and surgical intervention are not indicated, thus building a better and happier group of hearing handicapped individuals.

We, therefore, respectfully appeal to your committee for assistance and support in order that we may maintain the facilities now available, and we plead that your committee approve increasing the facilities to meet the needs where speech and hearing centers are not available.

Thank you.

Mr. Elliott. Mr. Lindsay has a question.

Mr. Lindsay. Do I understand from your testimony that the Medical Society of New York wishes to go on record in support of Senate Joint Resolutions 494 and 316? Those are the aid-to-the-teaching-training hearing bills.

Dr. Zwerling. Yes, sir.

Mr. Lindsay. Does the same apply with respect to H.R. 3465, which is the Rehabilitation Act of 1959, the so-called independent living?

Dr. Zwerling. Yes, sir; insofar as I know.

Mr. Lindsay. The medical society takes the same position on that? Dr. Zwerling. Yes, sir.

Mr. Elliott. Thank you.

Our next witness is Mr. A. D. Buchmueller, executive director of the Child Study Association of America.

Is Mr. Buchmueller here?

He is not here, I am informed.

Let me go back a moment. Did Mr. Loberfeld come in?

Did Mr. Cloud arrive? He is the superintendent of the New York School for the Deaf.

Did Mr. Tunney, secretary of the Department of Correction, State

of New York, arrive?

We will go to Mrs. Shirley Kurs, of the Parents' Association, New York School for the Deaf.

Is Dr. M. Schmideberg present? Is Mr. A. D. Buchmueller present? Is Mr. Manual Kardonsky here, from the New York Association for Brain-Injured Children?

Is Dr. John Paul, chairman of the department of speech, State

University College of Education, present?

Dr. Paul, you may proceed.

STATEMENT OF DR. JOHN PAUL, CHAIRMAN, DEPARTMENT OF SPEECH, STATE UNIVERSITY COLLEGE OF EDUCATION, GENESEO, N.Y.

Dr. PAUL. Mr. Chairman and members of the committee, this is quite a distinct pleasure to be able to appear here to represent our unit from the State University of New York.

Mr. Elliott. It is a pleasure to have you. Where is the State Uni-

versity?

Dr. PAUL. Our university is at Geneseo, N.Y., about 400 miles up-

State.

Although I am appearing here as a representative of the institution and working there in a teaching and administrative capacity, I would like to qualify myself also as an expert witness in the area of speech

pathology and audiology.

Prior to coming here, I was director of speech pathology at the University of Alabama Medical Center, and prior to that the director of the training program and clinic at the University of Mississippi, and before that the assistant director of the clinic at Purdue University.

In all of these positions, I have been concerned with other areas

that are under consideration today.

I have served on the Professional Board of Aid to Retarded Children in Birmingham, Ala., and was adviser to the State chapter of that group, as well as being consultant to the cerebral palsy school there.

In Mississippi I was consultant to the State cerebral palsy state hospital and the state school for the deaf, among other organizations.

I would, first of all, like to note that in the 20-some years that I have been concerned with this field, it has been with a great deal of pleasure that I have seen the Federal Government taking steps to help overcome the increasing difficulties we are having in attempting to cope with the needs, particularly in the fields of speech and hearing.

Mr. Elliott. Dr. Paul, what do you think about the mentally retarded bill we passed last year, but for which we just made the initial appropriation in the session of Congress just closing? We appropriated \$1 million, as you may know, to provide teaching fellowships.

Dr. PAUL. Yes, sir, this is a very helpful kind of thing. We do have a teacher training unit at Geneseo for training teachers of the mentally retarded. We are getting financial assistance and it is very helpful.

Mr. Elliott. Is it your general idea that we ought to do something along that same line in these other fields that you are speaking to us about?

Dr. Paul. Yes, sir. I think there are several other areas besides the mentally handicapped field in which direct support of the institution as well as the student can help considerably.

Mr. Elliott. I did not want to get ahead of you, but I am interested in what you are saying.

You may proceed.

Dr. PAUL. In general, I think I must say that without some kind of additional assistance, we are going to be more swamped in the very near future than we are now with regard to the need for assistance in all of these areas.

I am not going to go into the facts and figures which you have already heard, but with the increased assistance from medical science, you know that more children are living with more difficulties today than ever before in history, and that along with our birth rate, which has jumped remarkably since World War II, we are having the very difficult situation of attempting to contend with a greatly increased demand for services, at the same time we are drawing from one of the lowest manpower pools we have had to face in recent years.

If you go back to the low birth rate year of 1933, that makes our people who are now in the doctorial training programs coming from this very low birth rate year, and yet trying to deal with a large number of children, particularly, for whom we need a great deal of service. Of course, we can come right on down the line with regard to those who

are at the master's level now.

Mr. Elliott. In which fields, Doctor, are the shortages the greatest? Dr. Paul. I could not give you comparative figures on all fields. I have a general notion of the shortages in other areas. The shortages I am most concerned with, of course, are those in speech pathology and audiology, that being my own professional area.

Mr. Elliott. Discuss the shortage in that field a little bit, with

specific numbers, if you would.

Dr. Paul. With regard to House Joint Resolution 494, which I believe is the bill you introduced, the figures there, I think, are a very conservative estimate, both of the number of children who are involved and the shortage insofar as the trained personnel are concerned. The figure is just normally, insofar as incidence is concerned, or the figures compiled by Wendell Johnson for use at the White House Conference, a 6 percent incidence of speech handicapped people and 4 percent incidence of hearing handicapped people, which is the lowest defensible figure, not the highest. We cannot go below this figure. It makes a total of close to 10 percent. You cannot go below that figure and defend going any lower.

Mr. Elliott. Is there much overlapping in those two fields?

Dr. Paul. Yes.

Mr. Elliott. What percentage?

Dr. PAUL. Insofar as the hard of hearing are concerned, over half are in need of speech correction. Of course, when you go in to the area of multiple handicaps, that has already been mentioned today, we have people who are cerebral palsied, hard of hearing and partially sighted with speech problems, and, of course, quite often mentally retarded.

The medical director of the largest center for taking care of epileptics in the country, if not in the world, told me that they were having a great deal of difficulty because they have good medical care, they have young people who are controlled as far as seizures are controlled,

medically, but they have no one to teach any of the children, they have no one in speech correction, no one to work with speech.

There are several shortages insofar as other professions are con-

cerned than medicine.

I was very interested in hearing the remarks that Dr. Zwerling had to make concerning the needs that the medical profession is recognizing insofar as the consideration of other professions is concerned. It is something that has become more and more apparent.

I can assure you that my medical colleagues at Alabama shared this feeling 100 percent. I was in the department there in my pro-

fessorial appointment.

The needs insofar as speech and hearing are concerned, as I indicated, I believe are rather conservatively stated because these figures were gathered some 5 or 6 years ago, and we have had, of course, our continuing increase of children getting particularly into the public schools where the need really becomes apparent and where we do our best job of case location.

But our needs go further than just the need for having rehabilitation personnel. It has been mentioned several times by several witnesses before this committee that we have the first problem of loca-

tion, and then after location a very difficult problem of diagnosis, particularly for these multiple handicapped children, when you need the services sometimes of 8 to 10 specialists before you know what to do first or how to proceed after a certain amount of work has been

accomplished.

The diagnostic end of our work, particularly in speech and hearing, which is my field, is one that I think is very often overlooked. This is an area in which I think this particular committee and its recommendations and consequent possible legislation, can be of a great deal of assistance. The money end, I think, is quite obvious, that in order to get an increase in personnel, many people need financial assistance. But more than that, the money that is needed to provide training facilities is quite considerable also.

One witness this morning mentioned that in order to train people in a highly skilled occupation or profession takes more trained people for the training than you need in order to give a lecture to a group

of 40 or 50 students.

A study that we made while I was working with the Southern Regional Education Board on the Special Education Committee indicated that the better clinics throughout the South used a ratio of one instructor to every eight or nine students in speech and hearing clinics for their training program. This is, of course, quite different than the 1 to 25 ratio which is often used for classroom teaching purposes. But the financial end is very difficult in many institutions.

There is also, of course, the problem of staffing the present training programs. This is becoming an increasingly difficult job because of the need across the board for professionally trained people in hospitals, clinics, in speech and hearing centers across the country, so it is now getting difficult to obtain the professional services of well-trained, highly skilled people in speech pathology and audiology, who are willing to teach, because it not only is a matter of a shortage of people but the salaries are not as good as you can get in other places. So there is a difficulty of even staffing our training programs in existence,

much less expanding programs beyond those that already exist or

building them up to a necessary level.

One point that I would like to make in support of one of the provisions of House Joint Resolution 494, with regard to training of speech pathologists and audiologists has to do with section 201, the sentence beginning on line 14 and ending on line 20, which has to do with national certification qualifications for the selection of training programs for support.

This is a very difficult problem locally in institutions of higher education; that is, State by State. In all the States I have worked in, I find that the State education departments set minimum standards, and they are confessedly minimum standards, and yet these minimum standards very often become the maximum standards for the training institutions for some of the reasons that have been mentioned pre-

viously.

So, going to a national professional certifying agency rather than depending upon local educational agencies, I think, is a very important way of encouraging the upgrading of training programs. In fact, I had one responsible certifying officer in one State department of education say he was not concerned with the American Speech & Hearing Association, which does certify nationally, that the difficulty was in getting someone out to take care of the children immediately, which I think is an evasion of a primary fundamental responsibility.

The upgrading of the training is one thing that I think should be encouraged whenever possible. This, would, I believe, serve to do

that.

The principal point that I would like to make with regard to how I believe particularly Resolution 494 would help, quite apart from .

the financing end of things, is in the recruiting of students.

One thing I think that is very often overlooked by people who are not directly concerned with training programs is that, in order to get graduate training programs built up, we must draw from an undergraduate program. So, in order to get at the figures which are mentioned in this bill, which is to quadruple the supply of speech pathologists and audiologists today, that means that we must somehow recruit from an undergraduate program which, in itself, has an attrition rate of about 40 percent, from the time students start in until the time they are ready to go into graduate work. So the recruiting, as a factor in increasing the supply of professional personnel, has to actually reach down to the junior level in high school. This is what we are experiencing in our offices across the country. I have this from our director of admissions, that unless we get the people interested in a given field by their junior year in high school, they are already applying for admission to a given program and a given college when they are seniors. In fact, we are interviewing people right now for admission next fall, seniors in high school.

If we are going to draw from an undergraduate training program for speech correction, at the graduate level in 1 year's time, if we are going to train people to be competent diagnosticians as well as therapists, they must get a portion of that training in their undergraduate

years.

That means essentially that to quadruple the number of well-trained highly qualified specialists at the graduate level, we have to

expand our undergraduate training programs also, perhaps to the

tune of 6 to 8 times, if not 10 times.

My suggestion directly on this score is that smaller training institutions be encouraged to expand their training programs at the master's level rather than depending upon a few large institutional training programs across the country to supply the manpower we need.

Most institutions serve a rather restricted local area. So if we have many smaller, medium size and smaller institutions across the country recruiting in all of these areas, we will then have the feeders up to the graduate program which are necessary if we are actually going to get four times as many highly competent specialists as we have today.

Mr. Elliott. Doctor, Mr. Daniels has a question for you.

Mr. Daniels. Apparently you are familiar with House Joint Resolution 494, which recites that some 8 million Americans of all ages suffer from speech or hearing impairments and further recites there are some 20,000 speech pathologists and audiologists needed to train, diagnose, and rehabilitate them.

Are those figures a conservative estimate of the number of people

in that field and the number of teachers, in your opinion?

Dr. Paul. I think that the estimate of the number of people needing attention is quite conservative, provided you will admit the less complex, less severe cases, because, actually 10 percent is the figure that has been arrived at nationally through our national association as the number of people actually in need of trained assistance in both areas of speech and hearing.

So, out of the 180 million population, that means 80 million rather

than 8 million.

For severe cases, yes; I would agree with that figure.

Mr. Daniels. How many training centers do we have in the United States for the training of speech therapists and aduiologists?

Dr. Paul. That is a tricky question because you go into the matter of qualifications. If you accept local qualifications where in some States 6 hours' training is adequate, we have many. If we accept the national standards now being written into law by many State departments of education, you would reduce the number considerably.

Mr. Daniels. Are the present facilities adequate for the training

of the necessary personnel?

Dr. Paul. No, sir. We seem to be losing ground rather than gaining right now.

Mr. Daniels. Do you think the Federal Government is wise in looking into this area?

Dr. Paul. I think not only wise but to be very much commended for doing so.

Mr. Elliott. Are there any further questions?

Mr. Giaimo. Assuming that the Federal Government does not get into this field, what plans are envisioned for trying to accomplish

some of the results?

Dr. Paul. Well, there are several of us who share my own feelings that the solution is building up smaller training programs in many locations across the country. Several of my colleagues are doing just that, have done exactly what I did, leave a strictly professional practice to go back into a training or educating function.

This is about the best we can see, except for grants from certain agencies. There are certain agencies that do help, such as United Cerebral Palsy, Society for Crippled Children and Adults. There are many agencies that will assist, but it is rather stopgap and temporary.

Mr. Giaimo. Are the States becoming increasingly aware of the

problem you are faced with?

Dr. Paul. Yes; as the demand grows, particularly in the public schools, where I think most of the work really needs to be done, as the demand grows, the State administrations become increasingly aware. But by the time it trickles down to the local administrations in the institutions of higher learning we are still pretty far behind in trying to catch up.

Mr. Giaimo. Thank you.

Mr. Elliott. Thank you very much, Doctor.

I am told that Dr. M. Schmideberg, director, Clinical Services Asso-

ciation for Psychiatric Treatment of Offenders, is present.

You may proceed, Dr. Schmideberg, with the exception that we have to limit our witnesses to about 10 minutes.

STATEMENT OF DR. M. SCHMIDEBERG, DIRECTOR, CLINICAL SERVICES, ASSOCIATION FOR PSYCHIATRIC TREATMENT OF OFFENDERS

Dr. Schmideberg. My main point today is that we see a great number of juveniles, mainly over 16, who either cannot read or cannot read but at the second- or third-year level. Sometimes they can read and do not understand what they read, and alternatively they can read but do not know arithmetic. Ask them, "How much is 3 times 15?" and you get amazing answers.

I think some stress has been laid on reading disability, which is, to me, illiteracy, but not knowing arithmetic—what it means in practice, of course, is this: The only chance a boy has who cannot read or who does not know elementary arithmetic is to become a trucker's

helper. He cannot even be a messenger boy.

So what happens to these boys?

I want to stress two things. These are not foreign-born. These are boys who are Americans, born here, or Puerto Ricans who have been in New York City for over 10 years, and they have normal intelligence. In fact, some of them are of superior intelligence. They have gone to school, they have even gone to high school, and somehow managed to get through school without really learning to read. It is hard to know how many are like that.

The training schools told me that, according to their statistics, 80 percent of their boys, and particularly those from the New York area, are below the fifth-year reading level, and their staff at the training school is so limited that they leave more or less as they were when

they came in.

If somebody can read at all, they manage to get him to the secondyear level, but not above. All organizations treat them as illiterates. They are usually on probation or parole, or sent to social agencies.

We have started now an auxiliary service of teaching them to read, to learn how to do some simple multiplication, and a minimum of

manners; by "minimum" I mean that that is necessary to get you a

job, where they do not know how to apply for a job.

What it means is also this: If somebody is going through the school and has not learned to read, he is outside of civilization; he is different from others, which has a very bad psychological effect on him.

There may have been peculiar reasons why they did not learn to read; but whether or not, not having learned to read, sitting on the back bench or being unwanted at school, of course, has a very bad effect

on their mentality.

Also, going to school and learning something is a preparation for the discipline you need to work later on. If they never have that discipline at school, if they never learned to read and write, or what used to be salled the three R's, they are unable to be employed. Usually they are unemployed. A large number of them become delinquents.

What happens is that they hang around at lunch time. Because they have nothing to do, they go out and steal a car in the afternoons.

Some do not even have that initiative, but stay home and are burdens to welfare. They are the first people to lose their jobs if there is

just a shade of a depression.

It seems to me it is important that something should be done. Apparently, the schools cannot help them, because a large number have been out of the schools. There are no facilities whatsoever for people over 16 learning to read and write.

It is also very hard to teach them. It is much easier to teach a small child and much easier to teach a foreigner. It needs a great deal of perseverence, patience, and understanding to teach them.

We have been trying in our organization, and we have also worked with various college men, and they have tried to do it. They go to the homes and they keep after these boys to get them to attend. There are great difficulties getting them to attend. We are trying to prevail upon the judges that it should be made a condition of probation that they learn to read. Some judges make it a condition and some do not.

I think there should be more publicity given to it and more should

be tested.

It is a very frequent reason for not having jobs and not holding jobs.

I think in the present shortage there are practically no facilities,

but there should be facilities.

In the meantime, I think we should enlist the citizens under professional guidance, trying to train boys and girls who do not know the most elementary knowledge.

That is all I have to say.

Mr. Daniels. In the State of New York, do you not have compulsory education?

Dr. Schmideberg. Yes.

Mr. Daniels. Are these children not obliged to attend school?

Dr. Schmideberg. Yes. They have compulsory education and go to school, but they manage to go without learning.

Mr. Daniels. If that is so, how do you account for the fact that the

boys, 15 and 16 years of age, are totally illiterate?

Dr. Schmideberg. Because until 2 years ago they were advanced whether they could read or not.

Mr. Daniels. These boys were permitted to remain in school being totally illiterate, unable to read, unable to do their arithmetic problems?

Dr. Schmideberg. Yes.

Mr. Daniels. And no program has been set up in the school system?

Dr. Schmideberg. Well, some schools have remedial reading, as it is called, but it is quite insufficient for the demand.

Mr. Daniels. Has any study been made, to your knowledge, as to

the causes of these conditions that you find?

Dr. Schmideberg. To my knowledge, no. But also I do not think a study has been made as to the extent of the illiteracy.

I think the first thing would be to establish the extent of it. I

have only discovered it by asking the boys.

When you see them, they appear like anybody else, and you do not even have the idea they do not know how to read and write until you ask them the questions.

Mr. Daniels. You have become cognizant of this problem by vir-

tue of your position?

Dr. Schmideberg. Yes.

Mr. Daniels. What is your position?

Dr. Schmideberg. I am director of the clinical services of the Association for Psychiatric Treatment of Offenders.

Mr. Daniels. Where?

Dr. Schmideberg. In New York City. That means we are treating offenders mainly referred by the courts but also by social agencies.

I believe that some court clinics are aware of it, but I do not think

sufficiently.

Probation officers are usually overworked. I imagine the welfare officials are too overworked to inquire into people's abilities to read and write.

Actually, I do not think anybody ever thinks of it, because you just take it for granted that people can read and write, until you find

out that they cannot.

So, it seems to me that the first step would be to find out what percentage it is. The training schools are aware of this to some extent.

Mr. Daniels. What percentage of the pupils referred to your agency by the court do you find in the category you have described here today?

Dr. Schmideberg. Of the juveniles, it is a large percentage. I do not think I could give it percentagewise because we only take a lim-

ited number.

Mr. Daniels. Suppose we try to arrive at it in a different way. How many boys per annum are referred to your agency by the courts?

Dr. Schmideberg. I would say about 200. Mr. Daniels. And of that percentage?

Dr. Schmideberg. I would say about 50 of them have very poor knowledge.

Mr. Daniels. About 20 percent?

Dr. Schmideberg. Yes. The training schools give a much higher percentage. As I say, our agency is not representative because we are picking and choosing. But I think the probation officers could find out if they have the time.

The training schools have made studies and have arrived at the 80 percent figure, which is a very bad one, and they claim it is not being remedied because of the shortage of staff.

Mr. Daniels. I have just one further question.

With reference to this delinquency problem, do you find that the children come from a certain area or strata of society, or would you

say from all levels?

Dr. Schmideberg. Well, I would say geographically they are all neighborhoods. Socially they are a poorer class. Maybe they can read, perhaps not well, but they do learn to read. But we have decent working class parents who themselves can read and whose children cannot.

Mr. Dantels. Thank you. Mr. Giaimo. Is it your contention that these people are emotionally disturbed not because of psychiatric disorders of some type or mental illness, but because of the fact that they do not know how to

read?

Dr. Schmideberg. I think it is a vicious circle. It is a question of the hen and the egg. I think of somebody 3 months behind, but it is not picked up until he is 3, 4 and 5 years behind, by which time he is utterly disinterested because he cannot follow. He is out of civilization. The other children look down on him. He feels like an outsider in the school. It makes him antisocial. He does not participate in normal activities. He feels different and he is different. So it is a vicious circle.

The large proportion of them are likely to become delinquent, first, because they are different, and, second, because they are not likely to get a job or they will get a very, very poor job. Those who do not become delinquent I think become welfare cases. Those become

emotionally disturbed.

Mr. Giaimo. But you think that basically it is the disability to learn

Dr. Schmideberg. And arithmetic, multiplication. They can do some arithmetic up to a point, but they do not know the multiplication table except hazily. They cannot do multiplication, they cannot do subtractions, and divisions I do not yet ask anybody to do.

Mr. Giaimo. What is your proposal to the committee?

Dr. Schmideberg. I think it should be directed to all levels. The schools should be given more help.

Mr. Giaimo. To teach them to read or to find out why they cannot

learn to read?

Dr. Schmideberg. To give those who are behind extra tuition. The training schools, almost all of them, are behind and need more staff to teach them. I think the college and welfare agencies should be alerted to the needs. I think a survey should be made as to the extent of this illiteracy.

Mr. Giaimo. Do you think the illiteracy is just because of the fact

that they are not getting special instructions?

Dr. Schmideberg. Well, having been 10 years behind your peers. Mr. Giaimo. Do you think if they had this special instruction, they would be able to read?

Dr. Schmideberg. At the proper time. The later you give it, the harder it is to give it, the more they have to adjust.

I think the courts also should use their powers. I think any agency that gets in contact with this type of population should use as much power, persuasion, and, if possible, other power, but also provide facilities. I think you should be giving individual instruction. I do not think you can give it in class any more because they are too difficult. They must be very, very small classes, maybe four or five.

Mr. Giaimo. Thank you. Mr. Elliott. Thank you very much, Dr. Schmideberg. Let me call the list again. Has Mrs. Shirley Kurs arrived? We have a telephone call that Mrs. B. Scher will not be here.

Is Mr. A. D. Buchmueller here, from the Child Study Association of America?

Is Manual Kardonsky here?

STATEMENT OF MANUAL KARDONSKY, PRESIDENT, NEW YORK ASSOCIATION FOR BRAIN INJURED CHILDREN

Mr. Elliott. Mr. Kardonsky comes to us from the New York Asso-

ciation for Brain Injured Children.

Mr. Kardonsky, will you do your best to summarize in 10 minutes? Mr. Kardonsky. Mr. Chairman and members of the committee, I am glad to see under your bill H.R. 3465, under the facts and declaration, you have a finding that there are many severely handicapped persons, and then you include "including the mentally ill or retarded." glad to see that, that you have these categories. But as a representative of an organization for brain injured children, I wish that you would include an additional phrase "or brain injured" in that particular area.

By "brain injury," medically speaking, we know that it is any dam-

age to the brain, whether it is prenatal or postnatal.

I submit to the committee a brief résumé of talks by Dr. Lawrence Taft, who is from the Department of Pediatrics of the Albert Einstein College of Medicine, a definition of brain injury, a diagnosis, the causes and the treatment.

Mr. Elliott. Without objection, that statement will be made a part

of the record.

(Material part of committee file.)

Mr. KARDONSKY. What I would like from the committee is that you would please include the problems of the brain injured in your thinking, in your planning.

For instance, in New York State, in the Department of Education, and in New York City in the Board of Education, brain injured children are considered to be physically handicapped. From this, they are presumed to derive certain benefits under certain laws.

In your rehabilitation or habilitation of persons, if you would aid them and perhaps follow on through on the thinking that the State of New York uses, we can derive benefits for brain injured children.

What are the main problems or what is the main problem of brain injured children? It is that they must receive education. It is one of the greatest crimes in New York City, in New York State, that you cannot find too many teachers to teach the brain injured children, and you turn around and have a vicious cycle. Because there are no

classes, there are no teachers studying for that field. Because there

are no teachers studying for that field, there are no classes.

I would suggest for your consideration that you find, through some of your teacher training grants, ways and means of implementing the funds available for such teacher training, as small as they might be. For instance, in New York City, the board of education grants sabbatical leaves of absence wherein the teachers who take such leaves may use it for study, for educational purposes, for travel, or what have you. They receive up to 40 percent of their salary.

We in New York City, and also in Westchester, allocate from our meager funds \$1,000 for each of the two communities toward the teacher training grant, but we find that no teacher is willing to take

the \$1,000 per annum as the basis of their annual salary.

If we can find some institution, or the congressional committee or some fund agency, to make up the difference to these teachers, we will find that there will be teachers willing to study for this particular field.

Gentlemen, if you take that into consideration as a beginning, I think that is doing something for the children who are brain injured.

Mr. Elliott. Thank you very much.

Mr. Daniels. Your recommendation, then, is a direct grant to the

student?

Mr. Kardonsky. Whether it is to the State—some means so that a student may get a grant. For instance, in New York State they have grants for cerebral palsy. If you have an additional grant in the State of New York for brain injured children, as such, we can then have teachers come into our field.

I will give you an example in New York City. They want to open a class. What do they do? They scout around for a teacher who may have some training and they will take her out of, say, a cerebral palsy class or a mentally retarded class or a health class, and say to

her, "Teach."

What happens is that if she is willing and has the heart for it, she will grow as the children grow. She will learn how to handle these children as the problems come up before her. If she knows where to turn to for supervision, she can really get some good aid in that sense.

We, as an organization, have several avenues where teachers can train in New York City and in Westchester. The only trouble is we do not have the funds for the teachers so that they can spend full time training. We feel that if they would train for 1 year they could be adequately prepared to handle our children.

Mr. Daniels. Where are these training centers that you refer to? Mr. Kardonsky. There is one at the Stephen Wise Synagogue in Manhattan here on West 68th Street, specializing in brain-injured

children.

Mr. Daniels. Are there any others?

Mr. Kardonsky. There is another one called the Lottie Kolinsky School, on West 77th Street. There is also in Westchester a school in Pelham. These are three centers which are outstanding in the handling of brain-injured children.

Mr. Daniels. Thank you. Mr. Elliott. Thank you very much.

Our next witness is Dr. B. Siegenthaler of the Speech and Hearing Clinic, of the Pennsylvania State University.

STATEMENT OF DR. B. SIEGENTHALER, AMERICAN SPEECH & HEARING ASSOCIATION

Dr. Siegenthaler. Although I am at the Pennsylvania State University as an associate professor of clinical speech, I am here today

representing the American Speech & Hearing Association.

For over 30 years the American Speech & Hearing Association has been active studying the causes of and treatments for problems of speech and hearing. Members of the association have been and continue to be interested in the magnitude of the problems, as well as in the professional training of speech pathologists and audiologists. The association has a continuing program of certification for its members, who represent the professions of speech pathology and audiology in America. This certification program, especially at the advanced level, indicates the presently acceptable competence for well-qualified professional speech pathologists and audiologists.

The intent of the following is to indicate the prevalence of speech and hearing problems according to studies by members of the American Speech & Hearing Association, as well as studies by other persons and agencies, and to support efforts to increase the number of ade-

quately trained speech pathologists and audiologists.

Prevalence of speech and hearing problems: It is convenient to subdivide the information that follows into several sections. In essence, we are speaking of the legislation as exemplified in House Joint Resolution 494. For clarity and convenience I have divided the following information into several subsections.

In all instances the final prevalence figures are based on the predicted continental United States, Alaska, Hawaii, and Puerto Rico

population for 1960.

Speech problems among children 5 to 19 years of age: The data on incidence of speech problems among children vary somewhat, but an attempt was made to arrive at an incidence figure which, all factors taken into consideration, gives a relatively conservative estimate of the magnitude of the problem. For the present purposes 5 percent was used as the incidence of speech problems among schoolchildren. The publication, Statistical Abstracts of the United States, 1959, 80th edition, U.S. Department of Commerce, Bureau of the Census, indicates that in 1960 there are expected to be 49,782,000 children between the ages of 5 and 19 years in the United States, excluding Alaska, Hawaii, and Puerto Rico. If the incidence of 5 percent is applied to this population, 2,489,100 children of school age are expected to have speech problems in 1960. This does not include children with hearing problems.

A number of specific aspects of the data are of interest. For example, in 1959, Ohio had 79,688 school age children with speech problems. Of these only about 30 percent were receiving corrective therapy, largely because of the lack of trained therapists. Cerebral palsy, a neurological disorder which frequently causes speech problems, afflicted between 75,000 and 125,000 children living in the United

States in 1947.

In 1953, there were 306,743 children in special education classes specifically because of speech disorders.

In 1946, there were 1,134 cleft-palate children living in the State of

Wisconsin

These figures, although fragmentary and somewhat out of date, give a few details of speech problems among school age children.

Speech problems among children under 5 years of age: There are no comprehensive studies available regarding incidence of speech problems among children under 5 years of age. However, a number of conditions causing speech problems are present at birth. Both cerebral palsy and cleft palate are of this type, and the incidence of cleft palate and cerebral palsy would be expected to be as great among preschool children as among older children. Stuttering typically has its onset during the preschool years. Other speech problems, such as articulation defects, also have their onset during the preschool years, but they are more difficult to diagnose at that age.

Cerebral palsy occurs in about 0.07 percent of the live births, and the rate of cleft palate is about 0.18 percent among live births. If these two figures are applied to the estimated 21,019,000 of children under 5 years of age predicted for the United States in 1960, it is expected that 52,457 children under 5 will be suffering from these 2 afflictions. In addition, a very conservative estimate would be that an additional 1 percent of the children under 5 years will have other types of speech problems. This percentage would produce 210,190

additional children with speech problems.

Thus, it may be predicted that in 1960 there will be an estimated 262,737 children of preschool age with speech problems living in continental United States. This does not include children with hearing

problems.

Speech problems among adults: As with incidence studies on children, the data on adults vary somewhat from study to study. Studies, in which trained speech therapists examined the sample of populations considered, have reported the incidence to be as high as about 5 percent. Inasmuch as speech pathologists have the effect of reducing the prevalence of speech problems among the patients they treat, the incidence of speech problems among adults may be expected to be somewhat less than among children. However, a countereffect is that stroke, traumatic injuries, and removal of the larynx as a treatment for cancer are more common among adults, especially among the older citizens than among children. In view of these counterbalancing factors a 3-percent incidence is reasonable for speech problems among the adult population. The estimated U.S. population over 19 years of age is 110,353,000 in 1960, excluding Alaska, Hawaii and Puerto Rico. Thus, it is estimated that there will be 3,310,590 adults in the United States with speech problems in 1960.

Some specific data are of interest. Among the 170 Veterans' Administration hospitals it is estimated that 1,500 veterans per year are admitted because of stroke, which commonly produces aphasia. In the State of Pennsylvania alone, during a 6-month period in 1958, 92 persons were operated on for cancer of the larynx. At this rate there are at least 1,108 laryngectomies performed in the United States

each year.

Speech problems in Alaska, Hawaii, and Puerto Rico: The bulletin, "Bureau of Census Current Population Reports, Population Esti-

mates, February, 1959," gives the 1957 combined population for Alaska, Hawaii, Puerto Rico as 2,990,000. Allowing only a 10,000 increase in population for these areas by 1960, and utilizing the same overall rate as found for the continental United States, namely, 3.4 percent, an estimated 102,000 persons of all ages may be expected to have speech problems in 1960 in Alaska, Hawaii, and Puerto Rico.

Hearing loss among school age children: The results of a number of recent surveys suggest that the incidence of hearing loss among school age children is about 3 percent. Thus 1,493,460 school age children may be expected to have some reduction in hearing acuity in

1960, within the continental United States.

However, many of these children will have mild losses, or losses limited to one ear which do not necessarily result in education handicaps. The incidence of significant or handicapping hearing loss is about 7 percent among the U.S. population between the ages of 5 and 19 years. Thus 348,474 school age children may be expected to have educationally significant hearing problems in 1960, excluding Alaska,

Hawaii, and Puerto Rico.

Hearing loss among children under 5 years of age: Among preschool age children the incidence of handicapping hearing loss is expected to be lower than among older children. Although many children are born with hearing loss which remains throughout their lives, others acquire hearing loss after becoming of school age. For purposes of the present report a somewhat arbitrary figure of 3 percent was chosen to estimate the number of hearing handicapped children of preschool age. When this incidence figure is applied to the estimated 21,019,000 children of preschool age for 1960, it is to be expected that 63,057 children under 5 years will have significant hearing problems, excluding Alaska, Hawaii, and Puerto Rico.

Hearing loss among adults: Among the adult population the incidence of significant hearing loss is believed to be greater than the incidence of significant hearing loss among children. This is true partially because hearing acuity undergoes progressive reduction as a function of age. Thus the older segment of our population has a relatively high incidence of handicapping hearing loss. It has been estimated that as of 1959 there were 2,302,700 hard of hearing and deaf persons over 15 years of age in the United States. This is an incidence of 2.1 percent. Applying the 2.1 percent incidence to the estimated adult population in 1960 gives 2,317,413 with significant hearing problems in the continental United States.

Some data on specific segments of our adult population are of interest. For example, at the present time there are 90,000 veterans receiving either compensation for "service connected disability" or "pensions" because of hearing loss. During the years 1954 through 1958 the bureau of rehabilitation in Pennsylvania brought to successful closure 1,952 clients who either had deafness or handicapping

hearing losses.

Hearing loss among Alaska, Hawaii, and Puerto Rico:

According to the previous computations, 1.5 percent is the overall incidence of handicapping hearing loss among the population residing on the mainland. If this same incidence figure is applied to the estimated 3 million total population of Alaska, Hawaii, and Puerto Rico, there will be an estimated 45,000 individuals with handicapping hearing loss in these areas in 1960.

Summary of speech and hearing problems in United States and Puerto Rico: If all of the previously obtained data are summed we find that there will be an estimated 6,164,427 individuals with speech problems, and an estimated 2,773,944 individuals with handicapping hearing problems in the United States in 1960. The grand total of these figures is 8,938,371, the estimated speech and hearing problem population of this country in 1960. These nearly 9 million American citizens with speech and hearing problems represents what is believed to be a relatively conservative estimate which does not take into account the probable increase in the proportion of our population over the age of 65. As indicated earlier, this older part of our population may be expected to have an increased rate of handicapping hearing problems as well as an increased rate of certain types of speech problems.

Attached to this manuscript is a summary of the incidence and

prevalence figures mentioned earlier in this report.

(The figures referred to follow:)

Estimated incidence and prevalence of speech and hearing problems among U.S. 1960 population (continental United States, Alaska, Hawaii, and Puerto Rico)

	1960 population	Incidence, speech problems	Prevalence, speech problems	Incidence, significant hearing problems	Prevalence, significant hearing problems

Dr. Siegenthaler. Personnel needs for adequately serving the population with speech and hearing problems: The successful habilitation of persons with speech and hearing problems requires the services of well qualified professional speech pathologists and audiologists. Good practice suggests a caseload of not more than 100 children per therapist in a public school speech and hearing program. The approximately 2,500,000 children of school age with speech problems indicates the necessity for 25,000 public school therapists. The office of vocational rehabilitation has estimated the need for one speech pathologist and one audiologist per 50,000 population in addition to public school therapists providing a strong speech and hearing program is operating in the schools. To meet the needs of the general population 7,366 speech pathologists and audiologists will be required as of 1960. Thus, a total of over 32,000 professional, competent people are required to meet the needs of our population with speech and hearing problems.

Mr. Elliott. Is that 32,000 in addition to what we now have?

Dr. Siegenthaler. This is including the present approximately 7,000.

Mr. Elliott. We have a shortage, according to your testimony, of about 25,000?

Dr. Siegenthaler. Something of that order at this moment.

This large number of appropriately trained speech pathologists and audiologists is in sharp contrast to the present supply of about 2,000 certificated and 5,000 noncertificated persons in the speech and hearing field.

Mr. Elliott. Is that the 7,000 you mentioned?

Dr. Siegenthaler. Yes.

Mr. Elliott. Only 2,000 of the 7,000 are certificated?

Dr. Siegenthaler. That is correct, at any level in the American Speech and Hearing Association. I am speaking in favor of the ad-

vanced level of certification.

To attempt to supply the Nation with over 32,000 professional personnel in speech and hearing within the immediate future is obviously unrealistic. The professional preparation of a speech pathologist or audiologist is rigorous and time consuming. The training must include academic work specific to speech and hearing problems, comprehensive clinical practicum or internship, training in cognate and ancillary fields, and at least some research orientated experience. To specify less in the professional preparation of speech pathologists and audiologists would produce persons incompetent to serve

the needs of our speech and hearing problem population.

If we set an exceedingly conservative goal of only 20,000 professionally trained personnel for 10 years from now, we must train speech pathologists and audiologists at the rate of 1,500 per year. The training of 1,500 per year would result in 15,000 over a 10-year period. This 15,000, added to the present 2,000 certificated and 5,000 noncertificated personnel would result in a total of 22,000. By allowing a 10 percent loss through marriage and so forth, there would be 20,000 remaining. Thus, if we wish by 1970 to obtain only 20,000 professionally trained personnel to meet the needs of those with speech and hearing problems, we must immediately begin to train at least 1,500 well-qualified speech pathologists and audiologists per year.

The 1,500 figure is markedly different than the 400 persons currently being trained in the speech and hearing field each year. The problem is even more acute when we consider the shortage of university personnel needed to train the future speech pathologists and audiologists. In 1956 only 34 doctorate degrees in speech pathology and audiology were granted. In 1957 the number had increased to

37.

The national professional body, the American Speech and Hearing Association, lists 30 schools training at the Ph.D. degree level and 40 at the masters degree level. To provide each of these training centers with additional staff and equipment to upgrade and expand teraining facilities would require on the average (based on Office of Vocational Rehabilitation experience at the past 2 years) \$11,000 per school per year, or a total of \$770,000 per year. If support were to be provided for the training of one-third of the needed 1,500 personnel we must train each year, and if this support were to beat the current average of Office of Vocational Rehabilitation traineeships (approximately \$2,500 per year) \$1,250,000 would be needed annually for traineeships. The combined annual cost of the teaching grants to 70 schools and training grants to 500 trainees would come to a total of about \$2 million. At the present time this would appear to be the only feasible method to begin to secure the personnel prepared at

a professional level if we are to make useful taxpaying citizens of the millions of speech and hearing handicapped in the United States—most of whom are presently receiving no professional help with their handicap because of the desperate shortage of trained personnel in

the speech and hearing field.

In closing may I express the appreciation of the American Speech and Hearing Association for this opportunity to present the above information to this committee. May the Congress as well as other governmental bodies be assured that the American Speech and Hearing Association stands ready to serve in whatever way it can the needs of these citizens who have speech and hearing problems.

Mr. Elliott. Thank you very much, Doctor.

Our next witness is Miss M. E. Tuttle, director of the vocational advisory service.

Is Miss Tuttle present?

If not, I will call the list of those who have been absent. Mr. Loberfeld? Is Mr. Bluestine here? Mr. Cloud? Mrs. Kurs? Mr. Buchmueller? Mr. Buchmueller is here.

STATEMENT OF A. D. BUCHMUELLER, EXECUTIVE DIRECTOR, CHILD STUDY ASSOCIATION OF AMERICA

Mr. Elliott. Mr. Buchmueller, you are the 23d witness we have today and, if you will, summarize, or proceed in whatever manner you care to within a 10-minute period. We will appreciate it.

Mr. Buchmueller. I will make it very brief, Mr. Chairman.

I just want to mention that I am very pleased that we have the opportunity of talking to the committee today as we have previously on other matters you have been interested in, such as prevention of delinquency.

Mr. Elliott. Mr. Buchmueller represents the Child Study Associa-

tion of Amorica

Mr. Buchmueller. As the committee may recall, the Child Study Association of America has the program of working with parents and training professional persons to work with parents to prevent problems of family relationships developing and, in this particular field of working with parents of children with handicaps during the past couple of years, we have been requested by more and more agencies, local and national, as well as private, voluntary, and governmental, to develop programs to work with parents in groups, particularly in this way: that as medicine has advanced its research and treatment programs for the development of services for the handicapped and chronically ill children, there has been an increasing trend to keep youngsters in hospitals and institutions a lesser period of time, and, therefore, place a greater burden on parents and families for their care and training development.

As a result of this, we have been working with a number of institutions, such as the Institutes for Physical Medicine here in New York, and the Children's Medical Center in Boston, in the development of training programs to train such persons as public health nurses, medical social workers, physicians and others, to work with parents in groups in the further understanding of the emotional as well as physical needs of youngsters with chronic illnesses and physical handi-

caps.

As a result of this, the week before last an institute provided by the Children's Medical Society of Boston and the Child Study Association of America was conducted for professional persons in Boston to explore and develop the needs as well as the resources available to carry on this kind of work—that is, to be of help to parents in groups in understanding and dealing with the problems of everyday living with children with handicaps so that programs of rehabilitation of these youngsters can have a more sound foundation in earlier life.

Since this was an institute that was held just a little more than a week ago, we do not have the proceedings as yet; but, with your permission, I would like to submit to you the summary of the addresses given to the general session, as well as the summaries of the workshops of the several days of institute in order to have this available to you, and see what can be done as far as work with parents when resources are available for the handicapped children.

Mr. Elliotr. Without objection, the several summaries referred to by Mr. Buchmueller will be received and made a part of the com-

mittee's files.

Mr. Buchmueller, if you could get those things down within a few pages, we could include them in the record as a part of your testimony, if you care to.

Do you think you could have them within 10 days?

Mr. Buchmueller. Yes. These would have to be summaries.

Mr. Elliott. If you really summarize, say, within 10 or 15 pages, we will receive it as part of your testimony, and the committee would have the benefit of it.

If you send us a big, thick book, though, we may not get around to

reading it.

Mr. Buchmueller. I appreciate that.

Mr. Elliott. Send it to my office at Jasper, Ala., if you will.

Mr. Buchmueller. The reason we are very happy to be able to present this point of view is that although we realize there are tremendous needs for services to the handicapped and chronically ill, in direct medical as well as social services, we feel that by developing some of these services to work with parents must necessarily form a foundation upon which other kinds of activities can be based for later life.

I would be very happy to answer any questions that any of the

gentlemen would like to raise.

Mr. Elliott. Are there any questions of Mr. Buchmueller?

If not, thank you very much, Mr. Buchmueller. We will expect to hear from you again later.

Mr. Buchmueller. Thank you.

Mr. Elliott. For the last time: Are Mr. Loberfeld, Mr. Bluestein,

Mr. Cloud, Mr. Scher, or Miss Tuttle present?

Miss Tuttle was actually not scheduled to be here until 4:10 p.m. I have 4:05 now. If Miss Tuttle should come in in the next 5 or 10 minutes, we will accept her statement in writing for the record; or if she wants to return tomorrow morning, she can be heard at that time.

At this point I will place into the record a statement of the American Diabetes Association, dated October 28, 1959, and also a statement

of the Vocational Advisory Service, New York, N.Y., dated October 28, 1959.

(The statements referred to follow:)

STATEMENT BY THE AMERICAN DIABETES ASSOCIATION

The American Diabetes Association was organized and incorporated as a medical organization in 1940. The association is a nonprofit membership organization and the only national organization of its kind serving in the field of diabetes in the United States.

The association's membership today numbers about 2,500 physicians and other scientists and includes members from every State in the Union, from

Puerto Rico, and from 27 foreign countries.

The broad objectives of the association, in the language of its constitution and bylaws, are "to further the general welfare through acquisition and dissemination of useful and accurate knowledge and information regarding diabetes melitus and to undertake in the public interest such activities as will improve the physical welfare of persons having that disorder." To these ends, the association strives—

(1) To promote among physicians and others the free exchange of knowl-

edge with respect to diabetes mellitus;

(2) To improve the standards of treatment;

(3) To promote medical research by individuals, hospitals, clinics, universities, and other institutions;

(4) To educate the public in the early recognition of the disease and in

the importance of medical supervision of its treatment;

(5) To distribute accurate information to the general public by literature, meetings, and other appropriate means;

(6) To develop educational methods designed to give diabetic patients

a better understanding of their disease;
(7) To encourage the formation of subsidiary groups which will cooper-

ate actively with the association in its program.

The association now has more than 35 boards and committees which are active in virtually every phase of diabetes. To assist the American Diabetes Association in fulfilling its objectives, 41 local and State affiliate associations have been established throughout the United States. These affiliates carry out the program of the national organization in the fields of professional, patient, and public education at the local level. Active contact is maintained with more than 900 county and State medical societies which have working committees on diabetes, as well as many national, international, and government agencies and organizations. It has been a member of the National Health Council since 1944 and was one of the charter members of the International Diabetes Federation in 1952.

It is estimated that there are more than 2 million diabetics in the United States and almost one-half of that number are unaware that they have the ailment. Approximately 4,750,000 living today are potential diabetics, which means that they will develop the condition sometime during their lives. Almost 65,000 persons become diabetic each year. It is estimated that four out of every five diabetics is in the 40-and-over-age group. The following table represents,

generally, the incidence of diabetes by age groups:

				iabetes	
up	to	20	1	in	2,500
20	to	40			
40	to	50			
50	to	60	1	in	100
60	to	70	1	in	50

In carrying out its general purposes, the American Diabetes Association conducts a broad program, primarily educational in nature, and directed to the diabetic patient, to the public, and to the members of the medical profession.

Public education and detection

Each year during the third week in November, the American Diabetes Association, with the cooperation of its 41 affiliates and county and State medical societies throughout the country, observe Diabetes Week, the annual highlight of a year-round program in education and detection. During this period an intensive nationwide search is made for unknown diabetics and materials for

millions of tests designed for mass screening are distributed. This is combined with a broad educational program to acquaint all segments of the community with the important facts and symptoms relating to diabetes through appropriate literature and through the media of newspapers, magazines, radio and television. Labor, industry, schools, pharmacists, civic organizations, and other groups participate and a special effort is made to reach elderly diabetics. It is suggested that each community set aside 1 day during Diabetes Week to be known as Senior Citizen's Day and that the local organization responsible for the diabetes program cooperate with Senior Citizens' Clubs, Golden Age Clubs, welfare departments, homes for the aged, churches, and all other groups within the community. This entire program emphasizes the importance of early detection and adequate control of the condition. Active participation of public or voluntary groups is sought to develop a communitywide detection drive, especially during Diabetes Week. As indicated in a survey of State and local projects compiled by the staff of the Committee on Labor and Public Welfare, "Studies of the Aged and Aging," Volume X, January, 1957, many health departments are cooperating in the conducting of diabetes-detection programs.

Pilot studies are conducted from time to time for the purpose of developing and evaluating new mass screening techniques. The most recent of these was held in the fall of 1958 by affiliates of the American Diabetes Association in Atlanta, Mich., St. Louis, and Dallas. This study resulted in the adoption of a new method for processing the urine testing unit known as the Dreypak.

In addition, the association prepared a public exhibit entitled "What Is Diabetes?" which is made available for showing to the general public. This exhibit, 10 copies of which are available, is in constant circulation at health fairs, county and State fairs and expositions, public buildings, on television, and such miscellaneous events as farm and home week programs.

Patient education

The increase in the number of local lay societies of affiliates has greatly strengthened the association's work in patient education. There can be no substitute for educational work done at first hand in the community and literally scores of meetings are now held each year by our affiliates. These include lectures, teaching classes, panel discussions, "cooking schools," and a variety of social activities which well lend themselves to educational purposes.

The American Diabetes Association also publishes a bimonthly magazine for diabetics and their families which now has a worldwide circulation of more than 55,000 copies. Arrangements have recently been concluded with the National Braille Press to publish copies of "ADA Forecast" in Braille for blind diabetics. The association is cooperating with the American Foundation for the Blind in the preparation of a transcribed "Talking Book" series consisting of transcriptions of 19 outstanding articles from "ADA Forecast." For those diabetics whose complications include blindness, copies of these transcriptions may be borrowed through the 30 regional libraries of the U.S. Library of Congress.

Forty-eight articles of special interest from "ADA Forecast" are now available in leaflet form and 200,000 copies of these articles have already been widely

distributed.

The association has also prepared a 32-page booklet entitled "Facts About Diabetes," especially for the newly detected diabetic and his family and the inter-

ested general public. Over 71,000 copies have been distributed.

In response to a widely expressed need, the American Diabetes Association has just published "A Cookbook for Diabetics," a 176-page compilation of recipes and menus. Available at very low cost (\$1) this book is considered to be of special value because diet is still the keystone in the treatment of all diabetics, whether they are controlled by diet alone or by diet along with insulin or the newer oral compounds.

The association suggests that all diabetics carry a suitable means of identification and the association publishes diabetes-identification cards which include a place for the diabetic's name, address, and phone number, his physician's name,

address, and phone number, type of insulin and dosage.

Professional education

The annual meeting of the American Diabetes Association is both the scientific and organizational center of association activities. The scientific sessions of the annual meetings are a clearinghouse for information collected or developed by individual members or invited guests and offer those in attendance an unusually complete summary of current information. There are now among the association of the scientific and the scienti

ation's various committees and boards 12 which are devoted to scientific discussion or to the consideration of scientific problems in the field.

The association has conducted seven annual 3-day postgraduate courses for physicians which have maintained a consistently high standard. The faculty has included a number of physicians eminent in the field and the series has been attended not only by physicians but by graduate students, medical students, interns, residents, and fellows. The postgraduate courses include basic information on diabetes and its treatment, as well as information on its recent developments. In this area, too, the association feels that the maximum effectiveness of its educational program can only be achieved through active, local cooperation. Affiliates are conducting clinical meetings regularly and many have their own postgraduate seminars, symposia or regular scientific sessions. In other areas, many county and State medical societies frequently devote all or a part of their scientific sessions to the subject of diabetes.

The journal Diabetes, published by the American Diabetes Association, is in its eighth year of publication and is virtually the only scientific journal in the world devoted exclusively to this ailment. Its circulation has increased steadily and now includes more than 3,600 physicians and other scientists particularly interested in this field of medicine. A number of articles and abstracts have appeared in the journal which relate to the problems inherent in the older diabetic and, particularly, with reference to cardiovascular problems. Of the several degenerative complications of diabetes, those of cardiovascular origin

are probably the most significant.

The association also publishes a 95-page "Diabetes Guide Book for the Physician," second edition, which is designed to aid the practicing physician in the management of diabetic patients. Recently the guidebook was supplemented

with an addendum on tolbutamide, an oral hypoglycemic compound.

A 24-page booklet entitled "Meal Planning With Exchange Lists" was also developed in cooperation with the U.S. Public Health Service and the American Dietetic Association and was prepared for physicians to help diabetics to select foods. This booklet was revised in 1957 and supplemented with a new section for juvenile diabetics. Our association, alone, has distributed about 90,000 of these booklets and approximately 150,000 exchange lists.

The American Diabetes Association has five scientific exhibits, one of which is displayed each year at the convention of the American Medical Association. They are available for and distributed to scientific organizations for display at scientific meetings throughout the country. These exhibits are entitled "Diabetes Detection by the Physician," "Management of Diabetes Mellitus," "Pathology of Diabetes," "Vascular Complications of Diabetes" and "Diabetes—Today

and Tomorrow: The Expanding Role of the Doctor."

A thorough discussion and examination of teaching of diabetes in American medical schools was conducted at a joint meeting sponsored by our association in cooperation with the National Institute of Arthritis and Metabolic Diseases on May 3, 1958. Representatives of nearly all medical schools attended and a transcript of discussions on the planning and operation of diabetes teaching programs will soon be available for distribution. A similar session is scheduled to be held in Los Angeles in January of 1960.

Recently the association inaugurated a program under which it will pay the travel expenses of speakers to address the clinical group of affiliate associations. Wherever possible, schedules are arranged so as to enable the speakers to also

address lay groups during their visit.

A subcommittee on standardization of the committee on professional education is now preparing diagnostic criteria for diabetes mellitus and, in addition, a glossary of terms relating to the condition and the classification of the varieties of diabetes.

The association's medical student and intern essay contest with prizes for the best paper on diabetes and for the best case report or review article is now going into its seventh year and appears to stimulate a constantly greater interest.

Research

The association's committee on research and fellowships has chosen to use the funds at its disposal, in general, for the support of physicians and other scientists interested in research rather than specific research projects. There is general agreement that the greatest need is to encourage young scientists to develop and to employ their talents in this vitally important field. The association has awarded three research fellowships for the 1959–60 academic year, and renewed a research fellowship for the second year. In addition, the association is a second year.

ciation is administering a grant on the study of the metabolism of sorbitol in the human being.

Further, on the basis of an extensive survey to determine the need for such a service, a plan has been approved for the publication of a semimonthly collection of abstracts of literature on diabetes from every available source throughout the world. Financial assistance for this project is being furnished through the National Institutes of Health and it is expected to result in a prominent and comprehensive coverage of recent developments of importance to research investigators.

Other related activities

The committee on employment of the American Diabetes Association recently completed a survey concerning the employment of diabetics among 127 leading business and industrial concerns throughout the country. An analysis of the survey, as well as a statement of the committee suggesting standards for the employment of diabetics in industry and business was published in the journal "Diabetes." The interest and response aroused have been widespread and a number of firms have requested copies of the report for distribution to subsidiaries. The committee concluded that an enlightened attitude on the employment of diabetics exists to an encouraging extent among these concerns. A brochure combining the results of this survey and the committee's statement on employment will soon be published and prepared for distribution.

The committee on statistics of the association prepares reports on the recent statistics of diabetes which are published at least twice each year in the Journal "Diabetes." The membership of the association and other readers of the journal are thus made promptly aware of detailed figures representing re-

cent trends relating to diabetes.

Affiliates of the American Diabetes Association have been made aware of the importance of developing programs for the instruction of police authorities throughout the country of the problems encountered by diabetics who are temporarily incapacitated as a result of their condition. Through our affiliates and through law-enforcement publications and agencies, it is hoped that police will be acquainted with the several factors which may result in such behavior in

order that prompt medical aid will be secured.

The American Diabetes Association believes that it can best serve the wellbeing of all diabetics, elderly and otherwise, by increasing the effectiveness of this four-point program. Except in dealing with those complications which are recognized to be inherent in the aging diabetic, these individuals can be expected to benefit from the same program that is of benefit to all other diabetics. Committees of the association, including its committee on policies, have under constant consideration new methods for accomplishing this objective, and the association is willing, in this connection, to assume such new responsibilities as may be both practical and constructive. Some illustrations of this interest are the pilot studies, previously referred to, of new mass detection methods; the soon-to-be inaugurated system of diabetes abstracts; the meeting, last year, with the representatives of the Nation's medical schools, on the teaching of diabetes; the publication of "A Cookbook for Diabetics," and the awarding of additional research fellowships. All of these new activities are a reflection of the association's desire to keep pace with the needs of all American diabetics.

Since the average longevity of the American population is increasing, diabetes, which is a degenerative disorder, is more prevalent among the aging and aged. This greater prevalence may be expected to lead to a greater incidence of cardio-vascular complications, most often found among the elderly. Because of this the association hopes that increasing attention can be diverted to the detection of diabetes among the elderly, to a continuing study of cardiovascular complications, and to those new research areas that may be developed by such further study. Much attention has been given to cardiovascular complications in the association's journal, "Diabetes," and in the association's annual postgraduate courses and scientific sessions. (See "The Vascular Complications of Diabetes Mellitus, a Clinical Study," by J. W. Bryfogle, M.D., and R. F. Bradley, M.D., "Diabetes," journal of the American Diabetes Association. March-April 1957, VI, No. 2, pp. 159-166, and "Sequelae of Arteriosclerosis of the Aorta and Coronary Arteries, a Statistical Study in Diabetes Mellitus," by Sidney Goldenberg, M.D., Morris Alex, M.D., and Herman Blumenthal, M.D. Ibid. March-April 1958, VII, No. 2, pp. 98-107.) A large number of the abstracts carried in the journal deal with cardiovascular problems (which can lead to such complications as blindness, gangrene, kidney disease, varicose ulcers, cerebral accidents, and

high blood pressure) and a number of the articles appearing in the journal discuss aspects of these disorders. More information is required in the entire field of diabetes, but, perhaps, in no area more than the cardiovascular complications

of diabetes mellitus.

Because diabetes is but one part of the overall health problems of the American population, the American Diabetes Association hesitates to suggest relative responsibilities for voluntary groups, local communities, or State and Federal governmental agencies. The association does believe, however, that voluntary groups play an important role in providing leadership and direction for health programs. A number of the members of the association are also most active in the programs conducted by other national health organizations and agencies.

The association, in carrying on its own program, has found that there can be no effective substitute for active local programs in education and detection which are undertaken with the active interest, cooperation, and participation of community organizations and of local medical groups. The American Diabetes Association, in attempting to create and to encourage as many such local programs as possible, and to enhance their effectiveness by a carefully planned overall coordination and cooperation, welcomes the cooperation of any group, community, or governmental agency.

Available publications

As an example of the materials which have been prepared in the development. of the association's progress, copies of the following are enclosed:

Patient education:

"ADA Forecast" (May-June 1959)

"ADA Forecast," reprint series (complete set)

"A Cookbook for Diabetics"
"Facts About Diabetes"

"Diabetes—Check Facts"

Public education and case finding:

Organizational kit, Diabetes Detection Drive (1958), including—

"Organizing Your Diabetes Detection Drive, a Manual for Chairmen"

"Finding the Unknown Diabetic: The Physician's Role"

"A Job That Will Pay Off for Business and Industry: Helping To Detect Diabetes"

"Detecting Diabetes: What It Means to the Workingman"

"A Responsibility for Pharmacists: Helping To Detect Diabetes"
"A Program for Women: Helping To Detect Diabetes"

"The Hunt for Hidden Diabetics," by Patricia and Ron Deutsch, the Saturday Evening Post, December 6, 1958, pages 20-21 Professional education:

"Diabetes Guide for the Physician" (second edition)

"Meal Planning With Exchange Lists"

A copy of the program of the seventh annual postgraduate course

A copy of the program of the scientific sessions of the 19th annual meeting

"Analysis of a Survey Concerning Employment of Diabetics in Some-Major Industries"

STATEMENT BY THE VOCATIONAL ADVISORY SERVICE, NEW YORK, N.Y.

Vocational Advisory Service has for 40 years been working in the field of educational and vocational counseling; and as a part of our program we have been concerned with the education, training and employment of the handicapped. During these years we have found that while it is not always possible to think in terms of paid employment as we begin to work with the severely handicapped, often the developing of avocational interests serves as a bridge to a possible vocational goal. And even where this goal does not prove attaintable, our experience has shown that the severely handicapped can be helped to lead more

satisfying and more independent lives. We are, therefore, very much interested in the work of the Subcommittee on Special Education, and especially in the bill H.R. 3465, independent living.

We should like to bring to your attention two special service-study projects which we are currently conducting, the findings of which we think might be useful

to the committee.

First, we are in the sixth year of a 7-year pilot study of vocational counseling for young people with cardiac damage or a history of rheumatic fever, which we are conducting under the sponsorship of the New York and the American Heart Associations. The study, designed for both service and research, has had the cooperation of the New York City Department of Health and the Board of Education.

It has sought to determine the needs of this special group, and the value of

early vocational counseling in meeting these needs.

The young people enrolled in this project will be counseled 1 year past their high school graduation or its equivalent, toward medically approved occupations and personally satisfying work lives. (Attached is a copy of the preliminary report, published in December 1956. The final report will be available in the fall of 1960.)

Second, at the request of the Handicapped Children's Home Service—a local agency concerned with the needs of severely handicapped young people, as they return to their homes from hospitals—we have this year initiated a special project in which we will seek to discover whether imaginative vocational counseling can help young people with severe physical handicaps lead more satisfying lives. The study will also consider what are the special problems involved in counseling these young people—as an example, the probable increased stress on avocational interests that may bring to the badly handicapped young person a fuller sense of his own worth, and more satisfactory life adjustment.

Findings of this study are, of course, not yet available.

While work with the handicapped is only a part of our program, this group has always been of deep concern to us, because of our conviction that vocational counseling can play an essential role in their total rehabilitation.

Mr. Elliorr. At this time, the committee will recess until 10 a.m., tomorrow, when we will reconvene in this room.

(Whereupon, at 4:05 p.m., the committee recessed, to reconvene at 10 a.m., Thursday, October 29, 1959.)

SPECIAL EDUCATION AND REHABILITATION

THURSDAY, OCTOBER 29, 1959

House of Representatives,
Subcommittee on Special Education of the
Committee on Education and Labor,
New York, N.Y.

The subcommittee met at 10 a.m., pursuant to recess, at the 71st Regiment Armory, Park Avenue and 34th Street, New York, N.Y., Hon. Carl Elliott (chairman of the subcommittee) presiding.

Hon. Carl Elliott (chairman of the subcommittee) presiding.

Present: Representatives Barden (chairman of the committee),
Elliott (chairman of the subcommittee), Daniels, Giaimo, Lafore,
and Wainwright.

Staff members present: Mary P. Allen, clerk, Subcommittee on

Special Education.

Mr. Elliott. The subcommittee will be in order.

We will proceed to hear the witnesses that are listed for today.

It will be necessary, as we did yesterday, to limit the time of each witness to 10 minutes. We heard 24 or 25 witnesses yesterday, but since we have an additional 10 today, it will be necessary that I enforce the time limitation a little more closely than we did yesterday.

We are happy to have the members of our subcommittee present. On my left is Mr. Wainwright, who represents a New York district.

On his left is Mr. Lafore, of Pennsylvania. On my right is Mr. Daniels, of New Jersey. And on his right is Mr. Giaimo, of Connecticut.

Our first witness is Dr. Lauretta Bender, principal research scientist, Department of Mental Hygiene, New York State.

Dr. Bender, will you come forward?

STATEMENT OF LAURETTA BENDER, M.D., PRINCIPAL RESEARCH SCIENTIST, DEPARTMENT OF MENTAL HYGIENE, NEW YORK STATE

Mr. Elliott. Dr. Bender, on my immediate right is the Honorable Graham A. Barden, chairman of the full Committee on Education and Labor, from the State of North Carolina, and on my extreme left is Mr. John Lindsay, who represents the district of New York in which we are now holding this hearing.

You may proceed, Dr. Bender.

Dr. Bender. Mr. Congressmen, I am an M.D., and a child psychiatrist by specialty. I have been a public servant in this community for more than 25 years.

For the first 20 or more, I was the child psychiatrist at Bellevue City Hospital, where I saw the stream of disturbed children, emo-

tionally disturbed children, that passed through the city into various State institutions or which happened in most instances, back again into the community, sometimes improved and sometimes not.

In the last 3 years, I have had the privilege of being with the New York State Department of Mental Hygiene in the capacity that you mentioned, but also as consultant to the Department of Mental Hy-

giene in the field of child psychiatry.

That includes not only my concern with all children under 16 who are in State hospitals in the State of New York, which amounts to more than 2,000 at the present time, but also all children who have psychiatric problems who are in the institutions for the mentally retarded.

This amounts to another probably 2,000 who are in the high grade level, and, therefore, salvageable, so to speak, probably salvageable.

I also confer with the Department of Welfare concerning those children who are in the correctional institutions for the boys and

girls under the age of 16.

Consequently, I have been able to see the changing attitudes toward the emotionally disturbed, mentally retarded, and so-called socially acting out, or, if they are caught, the so-called delinquent child in the State of New York for the past 25 years and have followed many of them into adulthood.

I have been interested in research, but only in clinical research, not

in the White Tower type, which limits one.

I would be glad to make two points today, but I will settle for one

in the 10 minutes.

The point I want to make concerns the midadolescent, particularly

the boy, since they are the largest number.

I would like to make the point that through all of these different institution, whether it is for the mentally retarded, the delinquent, or in the mental hospitals, we have the same type of boy. We have just as many mentally disturbed in the other two as we do in the hospital, and just as many retarded in the hospital and just as many delinquent in all the places.

It is almost a tossup where a boy goes.

The major problem, as I see it, from a point of view of education, and trying to tie it up with Federal programs, is that these boys' great-

est needs are in four areas.

In the first place, they are, by and large, all academically retarded. These boys who fail to make a social adjustment in the community, and who have to have some kind of public institutional care, on actual statistical study, it is shown that from 75 to 85 percent of them are nonreaders.

This doesn't mean they are 2 years retarded. It means they are

nonreaders, they cannot read.

These are boys from the age of 12 to 16.

I, myself, as a psychiatrist, am completely convinced that the best therapeutic program, and by therapeutic I mean therapeutic in terms of medical for this group of boys, in order to make them emotionally and mentally more healthy would be to teach them to read and to get adequate reading projects, even as late as in their midadolescence.

There, of course, could be a preventative program, but I am not

speaking of that now.

The next thing that these boys need is vocational training. Our hospitals, for instance, have no facilities for vocational training, although we have at the present time 2,000 of these children and they

are flowing through very rapidly.

I may, by the way, make a point that is very important. That is that our attitude in mental hospitals has changed very radically in the last 2 years, since we have gotten the drug treatments and the new physiological treatments.

Patients don't go to State hospitals to stay for the rest of their lives,

or to get away from their community.

We are aiming in the State of New York to have a hospital in every community and for the individuals to remain community-connected throughout.

The majority of these boys are returned to the community. They

need desperately to have vocational guidance and training.

The third area that they need is socializing group experiences with which they can identify in a wholesome way rather than with their gangs, or what you might call supervised recreation for all their spare time.

Then if it could possibly be obtained, and it can only be obtained in a few cases, they need to be individulized, and let's find out what each can contribute to the world in his unique individual capacity.

I know you already have, and this ties in, your vocational rehabilitation program, and the possibility of this vocational rehabilitation program being advanced into the large group of institutionalized boys, in order to help them get rehabilitated—one should hardly use the word rehabilitated, if there is a word rehabilitated for these boys it should be used—is an educational program which would save more in the way of chronic institutional care, of remember citizenship, if you want to call it that, or mulling around of these boys, because if they get out of one institution, they get into another.

My argument here is that I consider the reading lag, for instance,

one of the main causes for their maladjustment.

It is true they have many other things, but we can't give homes to every one of these boys. We can teach them to read. We can't give everyone of them a psychoanalysis, which I don't believe they should have anyway, but we can give them vocational training, and we can see to it that they get recreational supervision in the community.

The majority of these boys, regardless of their diagnosis, return to the community, and any kind of followup studies that we make show that most doctors are entirely too pessimistic about the outlook of their patients, and that most boys and girls have a growing capacity which will make it possible for them to reach out and obtain help and to get back into the community.

It is often just a sheer accident that they do get into institutions.

I may make the statement that every one in an institution or anyone who has ever been in an institution or ever will be in an institution, there are at least three equally disturbed, with equal problems, that are still in the community.

I might just go on one point further and that is to say that the older age group, as we go into the institutions, are simply a few years beyond the stage when they did not get this help and could still respond to it if they got it, so that you could carry this on up into adult education just as well.

I would like to make one other point, because it is an area I am much

interested in.

That is the lower age level. We have very recently in child psychiatry separated out a large number of young children who are not developing properly, who formerly were considered mentally defective.

We now call them emotionally disturbed. This is dislocated, in my opinion, although I have been largely influential in this situation because of the use of the word schizophrenia—a large number of children whose parents are mulling around about and demanding special services and special care.

These children are not much different from the usual retarded

children, and have the same needs.

Their parents are making a special point of this because the schizophrenic child has a potentially schizoprenic parent, and they represent a special problem for that reason.

In this partiular area, ther are questions which I am not willing to answer as clearly as I did in the other area; namely, what to do about

these children in terms of public education.

Offhand, it would be my feeling that they should get hospital care as long as they need it, and then when they are able to get into a group of children, even if it is with the retarded or whatever other group of children it is, they should then be put in that group, that they should not be isolated and segregated by diagnosis.

I think segregation by diagnosis is as malicious as almost everything else, because a clinical diagnosis does not indicate how a child is behaving. It represents a whole global concept of laboratory tests and

things of that sort.

It doesn't give you a picture of the child.

It is my feeling that these children should be diagnosed and evaluated and when they can return to a class which is already set up for other types of children, even if if is retarded, they might be able to get into that particular group.

Mr. Elliott. Are there any questions of this witness? Mr. Wainwright. I would like to ask one.

Dr. Bender, do you feel there is any disadvantage of locating geographically, we will say, in one concentrated area, mental hospitals, State, local, and Federal schools for mentally retarded chidren?

By that I am saying if you took a geographical area of some 20 miles and you concentrated these institutions in that locality, do you think

that that is good, bad, or indifferent?

Dr. Bender. I think it is very bad. I think your hospital facilities should belong to the community, and it should be distributed.

We should just get used to the idea that children that go to mental hospitals or for the mentally defective should not be isolated from the community.

In Creekmore, where we serve Queens County and Kings County, they go home weekends. They are discharged, even if they have to come back again.

We work with the parents in that unit and with the agencies in

the unit.

I think it will take a tremendous stigma away from this, and also get us away from the idea that patients go away in the State somewhere and are lost to the homes and communities in which they live.

Mr. Wainwright. In a concentrated area on Long Island there are some 50,000 people of this kind belonging to the various branches of the government. I was interested in your reaction.

Dr. Bender. As a matter of fact, Long Island is a big island. It is

almost a State, itself.

Mr. Wainwright. I am talking about just in terms of that particular area of Long Island.

Dr. Bender. I think by and large those hospitals are all serving the whole State.

Mr. Wainwright. The whole State?

Dr. Bender. Yes, but we are changing it very rapidly, and it has been changed within the past months. It is much worse, the children that go out of the city of New York, and go up to Rockland, lin Rockand County, those children get lost.

They never get back. When they get back, they have no school

to go to, no home to go to.

Mr. Wainwright. I was not thinking just in terms of children. I

was speaking of all patients.

Dr. Bender. Yes, but it is true of adults. As I said before, we are discharging patients were rapidly. To rehabilitate them, you have to have them near at home.

It is far better that the hospitals do their own aftercare. Those

doctors know the patients.

Mr. Wainwright. Thank you.

Mr. Elliott. Thank you.

Our next witness is Mrs. Nash, executive director of the Jewish Society for the Deaf.

STATEMENT OF MRS. TANYA NASH, EXECUTIVE DIRECTOR, JEWISH SOCIETY FOR THE DEAF

Mr. Elliott. Mrs. Nash, you may proceed with the limitation

which you heard me speak of before time.

Mrs. Nash. I represent the Jewish Society for the Deaf. We are a nonsectarian agency which is supported totally by federation of Jewish philanthropists of New York.

We are the only professionally organized agency for the deaf in

the United States.

There are parent groups, clubs, and other such lay groups, but we are the only agency established for professional case work with the

profoundly deaf.

I want to make it clear at the very beginning that the profoundly deaf are unfortunately lost in the whole problem of the overly impaired. These are not people who are like the hard of hearing, except that they are more hard of hearing.

These are entirely different kinds of people with different kinds of

communication problems and social problems.

We would like to recommend that in considering special legislation for those with impaired hearing, that the profoundly deaf, at birth or during infancy, numbering approximately 200,000, be considered separatey from the hard of hearing who number in the millions.

It is precisely because the profoundly deaf are such a small segment of the hearing impaired population that they have been bypassed, when from the very beginning they should have been recognized as a group with unique and more difficult problems than those whose impairment had been less severe.

The profoundly deaf have no usable hearing within the speech range, and the most that can be attained for them with the use of

hearing aids is to amplify sounds in their environment.

The hard of hearing, however, have functional hearing, and the use of the hearing aid thus increases the usefulness of this residual hearing.

The goal for the hard of hearing is integration with the normal hearing, and that has usually been attained with good successes.

However, this is not a realistic social goal for those with profound hearing loss, for ultimately they do not articulate clearly enough to be understood by the general population.

Thus, the profoundly deaf, whenever possible, tend to move to larger cities where they seek out companionship and marriage with

those who are similarly afflicted.

Their vocational training problems are also different because they cannot, like the hard of hearing, compete successfully on jobs where

intercommunication is required.

From our 30 years with approximately 7,000 profoundly deaf adults on a nonsectarian basis, the rehabilitation evaluations and procedures, as well as the goals now used for the hard of hearing, have

not proven realistic, for use with the profoundly deaf.

While all of us hope that research can one day point the way to alleviating the effects of severe hearing and speech handicaps, this can only come about if research is considered separately for the profoundly deaf in all areas, including teaching methods, vocational training, psychological evaluation, and the social services.

Thank you.

Mr. Elliott. Thank you.

Are there any questions of Mrs. Nash? If not, thank you very much, Mrs. Nash.

Our next witness is Mrs. Felix duPont, Jr., who I understand will be accompanied by Mr. Morris Clapper. They come to us from the National Association for Mental Health.

STATEMENT OF MRS. FELIX DUPONT, JR., NATIONAL ASSOCIATION FOR MENTAL HEALTH; ACCOMPANIED BY MORRIS CLAPPER, NEW YORK, N.Y.

Mrs. DUPONT. Thank you.

Mr. Elliott. Mrs. duPont, you may proceed.

If you care to summarize your statement, you may do that and place the full statement into the record, in the complete record of our proceedings.

You and Mr. Clapper may present your statement together. Since

there are two of you, I will allot you 15 minutes instead of 10.

Mrs. DUPONT. Thank you very much, Mr. Chairman.

I represent the National Association for Mental Health, and I presently am acting as the second vice president of that organization.

I will read this through quickly and briefly, because it puts our ideas on the table; and then if you have any questions, Mr. Clapper

and I will be very happy to answer them.

The National Association for Mental Health—and its 800 affiliates which are located in 43 States and the District of Columbia, and its more than a million enrolled members and volunteers, heartily endorse

House bill 3465, and we urge its speedy enactment.

We have a particular interest in this area, because all of the mental health associations are beginning to be more actively concerned with the whole rehabilitation problem. This is due, of course, to the marked acceleration in the discharge of mental patients, which has confronted the Nation with a new and most acute problem.

In 1955, the State and county mental hospitals, which account for about 85 percent of the Nation's hospitalized mentally ill, discharged 119,150 patients. In 1958, the last year, it has climbed to over 155,-

000.

The point about this discharge figure, which is most hopeful and encouraging, but which also has its serious and more sad side, is that very often the patients who are discharged are unable to make a good readjustment, and will break down and return to the hospital. The whole problem of care has to be undertaken again.

Of the 71,500 patients who were readmitted to the State and county hospitals in 1958, there were people who were on discharge from the hospitals who returned to an intolerable situation at home, the situation where they might even meet with outward rejection and unsuitable living arrangements, and even unsuitable occupational arrangements. Among these, also, were patients who were psychologically unable to cope even with conditions which might have, for the completely healthy person, been considered optimum but which for them were detrimental and hazardous.

A meaningful and comprehensive program of rehabilitation must take into account the thousands of former patients now living in communities throughout the country who, because of such handicaps, will eventually break down entirely and be compelled to rush to the

hospital.

At present, the rehabilitation program of the Federal Government is concerned primarily with vocational training and job placement, and through this program tens of thousands of Americans have been helped to find their rightful places in jobs and in their communities.

But a program which concerns itself only with vocational rehabilitation leaves out of consideration a larger area of handicap. There are hundreds of thousands of Americans who are psychologically and physically incapacitated, not only to the point where they cannot work but also to the point where they are unable now to live reasonably satisfying and productive lives.

It is quite clear that people suffering from continuing psychological or physical handicaps will be hampered in their vocational rehabilitation and will be unqualified for and unable to take advantage of the services offered through the Office of Vocational Rehabilitation. It stands to reason that any services which will relieve such

persons of their psychological handicap will improve their potential rehabilitation.

The independent living rehabilitation services provided in House bill 3465 will provide the much needed counseling, psychological, and related services to deal with continuing psychological handicaps. The benefits of these services will, without question, help to restore a large number of ware counter.

large number of wage earners.

The National Association for Mental Health also is interested in this bill, because we believe that the rehabilitation of the ex-patient, socially and psychologically, is as important as his vocational re-

habilitation, and that that really is an end in itself.

In certain cases they may not necessarily have to be employed, but they must be socially and emotionally adjusted to be able to take their place again in the community and as a member of their family, so that the service is very much needed.

We wanted to point out to you that the 1946 national Mental Health Act provided the impetus for the enactment of statewide community mental health acts, and 10 States have now these

community mental health acts.

You all know that under those acts the State and the municipality share the responsibility for the development of support of rehabilitation—medical and social and vocational. The Federal Government has demonstrated its tremendous job in giving this impetus in this area, and we feel that in the rehabilitation the same impetus will be given from the bill.

Therefore, we urge its passage.

If there are any questions, I will be very glad to answer them. Mr. Elliott. Are there any questions of Mrs. duPont?

Mr. Lafore. My question may not be relevant to your testimony, but, as a point of personal interest, have the discharges balanced with the admissions?

Mrs. duPont. Mr. Clapper will answer that.

Mr. Clapper. The discharges have not balanced with the readmissions which, I think, is an important figure, and very appropriate to your fiure. We have seen for the first time in 1958 a stabilization of the bed population of mental hospitals; that is, there has not been any increase. We reached a plateau. However, the readmissions have increased 9.5 percent over the previous year.

This points to this fact that the climate for receiving a discharged person in the community is not such as to retain him there for the desirable period of time. We feel, therefore, that the services Mrs. duPont described, which are proposed in H.R. 3565, would substan-

tially remedy this readmission rate.

Mr. Lafore. There is a possibility that in some instances they have

been discharged too soon, is there?

Mr. Clapper. I don't think that has been measured or gaged, officially, but I think the provision of community services might even offset any mistake in early discharge.

Mr. LAFORE. Thank you.

Mr. Daniels. You stated there are 10 States which adopted community mental health acts. Do you know the names of those States, or can you furnish them?

Mr. Clapper. Minnesota is one; New York; California is one of the

early ones; and New Jersey.

Mr. Daniels. May I suggest, if it meets with the approval of the rest of the committee, that you submit the names of those States to us.

Mr. Clapper. We will be very happy to do that.

Chairman Barden. May I ask this question: Just what did you mean when you said the climate was not good for readmission.

Mr. Clapper. I meant the climate in the community was not sufficiently adequate to retain those discharged patients in the community.

I will be specific about that. There are inadequate housing facilities. Many patients discharged from hospitals have no home to return to, and there is the problem of finding adequate housing. This area has been pioneered by the Veterans' Administration over the past 10 years or so in developing a very expansive foster home problem.

There is a serious gap in the provisions for the discharged patient, mental patient. The provision of recreation or social activities, which would help the discharged patient to reenter the community, are almost unavailable, except in certain sporadic cases. The provision of adequate vocational rehabilitation programs which will accept a mental

patient are very difficult to find.

I recently conducted a study of 86 rehabilitation centers throughout this country, the leading ones, and found that 25 rehabilitation centers admit some ex-mental patients. This is a small part of meeting the tremendous needs.

Furthermore, until now, rehabilitation legislation had to insist on a vocational feasibility for the acceptance of a patient into that pro-

So we had to be absolutely sure that a person was definite job-potential before he could be included in a program.

That meant setting a specific time goal for being prepared for that

These are some of the aspects of the unfavorable climate for the

readjustments of the discharged patients.

Mr. Elliott. The gentleman from New York, Mr. Lindsay.

Mr. Lindsay. Mrs. duPont, does your organization concern itself

with brain injured persons also?

Mrs. DUPONT. It concerns itself with all of the methally ill. The brain injured is really more in an area which is a little bit separate.

Mr. Lindsay. There was a witness yesterday who testified that the bill would have to be amended in order to include brain injured persons.

Mr. Clapper. I would doubt that very much from my reading of the bill. We are equally concerned, as a mental health association, with the mental problems of people generally and the emotional problems of people with physical handicaps as well.

As I read the bills, both H.R. 3465 and S. 772, I see no reason for

requiring any special inclusion.

Mr. Lindsay. Is your organization a fund-raising organization. Mr. Clapper. Yes, it is.

Mr. Lindsay. How much money do you raise a year?

Mr. Clapper. Our 800 affiliate organizations in 45 States raised

about \$6 million in 1959.

In addition, nationally, we do receive special grants from foundations and corporations in the interest of our research program, which has newly begun, about 2 years ago, which we hope will increase.

Chairman Barden. May I ask this:

Is there a charge for the services in the institutions that you promote?

Mr. Clapper. No, sir. We have no fees for any of our services.

Mrs. DuPont. I think we might clarify that a little bit for you, if I may, Mr. Barden. We don't run any direct services, the National Association for Mental Hygiene, except in very isolated cases.

There are two or three child guidance clinics that have been run and started by us, but we don't care for or give treatment to any of

the mentally ill people.

We are concerned with educating the public to see that they get the proper care from the proper institution, more than we are with direct services.

Chairman Barden. Remembering some of the trouble I got into in trying to pass the Barden-La Follette Act, are the organizations interested in projects such as yours and the development of a program pretty well together or are you fussing among each other.

Mrs. DUPONT. I think we are pretty well together. I think there are separate groups working. The mentally retarded has their own organization, and the emotionally disturbed children.

But I have not found at all any conflict of interest. In every one

of these cases we seem to be working together.

Chairman BARDEN. Just a hint as to what the results will be, we could not get to first base on the blind section of the Barden-La Follette bill until all the organizations got together. They did get together and worked together wonderfully well, and Congress passed

It did not cover everything to be covered for the next 40 years, but

it was a good act to start with and everybody agreed with it.

I wanted to just drop the hint that Congress has enough troubles that naturally fall in its way, and sometimes there is an inclination to go around the fight instead of trying to go into it.

Mr. Elliott. Thank you very much. Your testimony will be very

helpful. We appreciate it very much.

(The formal statement of Mrs. duPont follows:)

TESTIMONY BY NAMH IN BEHALF OF H.R. 3465, THE REHABILITATION ACT OF 1959

The National Association for Mental Health, and its 800 affiliates which are located in 43 States and the District of Columbia, and its more than a million enrolled members and volunteers, heartily endorse House bill 3465 and we urge its speedy enactment.

Rehabilitation of the recovered mental patient—the process of helping him to find a warm welcome, a home, proper followup medical care, and employment have always been a major concern of the National Association for Mental

Health.

In the past several years, however, this concern has taken on urgency and importance. A marked acceleration in the discharge of mental patients has confronted the Nation with a new and acute problem. In 1955, the State and county mental hospitals (which house about 85 percent of the Nation's hospitalized mentally ill) discharged 119,150 patients. In 1956 this figure rose to 133,200 and continued to climb, reaching 155,000 in 1958.

It is a well-known fact—and mental hospital administrators throughout the country will testify most energetically to this—that patients who are unable to make a good readjustment, very often break down once more and have to return to the hospital. Many of the 71,500 patients who were readmitted to the State and county mental hospitals in 1958 were people who, on their discharge from the hospital, were returned to an intolerable situation—a situation in which they were met with outright rejection, or were unable to find suitable living arrangements, or adequate followup medical care, or a suitable occupational situation. Among these, also were patients who were psychologically and physically unable to cope even with conditions, which might have, for the completely healthy person, been considered to be optimum—but which were for the not yet fully recovered person detrimental and hazardous.

A meaningful and comprehensive program of rehabilitation must take into account the thousands of former metal patients, now living in communities throughout the country—who because of such handicaps will eventually break down entirely and be compelled to return to the hospital—or at the best make a poor readjustment, and become a burden to themselves, their families, and

their communities.

At the present, the rehabilitation program of the Federal Government is concerned primarily with vocational training and job placement of those suffering from physical or mental handicap as a result of previous illness, or ongoing disability. Through this program tens of thousands of Americans have been helped to find their rightful places on their jobs and in their communities. But a program which concerns itself only with vocational rehabilitation, leaves out of consideration a large area of handicap. There are hundreds of thousands of Americans who are psychologically and physically incapacitated not only to the point where they cannot work, but also to the point where they are unable now

to live reasonably satisfying and productive lives.

It is quite clear that people suffering from continuing psychological or physical handicap will be hampered in their vocational rehabilitation, and will be unqualified for and unable to take advantage of the services ofered through the Office of Vocational Rehabilitation and its counterparts. It stands to reason that any services which will relieve such persons of their psychological or physical handicap will improve their potential for vocational rehabilitation and help restore them to the ranks of those who are self-supporting and who no longer need public assistance because of handicap. The independent living rehabilitation services provided in House bill 3465 will provide counseling, psychological and related services to deal with continuing psychological handicap, as well as physical restoration and related services to deal with continuing physical handicap. The benefits of these services will, without question, help to restore thousands of Americans to the ranks of wage earners.

But this is only one reason why the National Association for Mental Health so strongly endorses this entire piece of legislation and particularly its section

providing for independent living rehabilitation services.

While gainful employment of a handicapped person is an eminently important goal, both for the individual and for-society, we cannot hold with the thesis that vocational rehabilitation must be the sina qua non of any rehabilitation program, and that we shall not concern ourselves with social, psychological, and medical rehabilitation unless these contribute to vocational rehabilitation. We believe that personal and social adjustment are ultimate goals in themselves—whether or not they contribute to a person's vocational rehabilitation, and we feel that this principle is recognized and served in the independent living provisions of H.R. 3465. We therefore strongly endorse this provision, and

the entire legislative proposal in which it is embodied.

Those who have studied the growth of community services for the treatment and prevention of mental illness and for the rehabilitation of the mentally ill, will have noted that the enactment of Federal legislation in 1946—the National Mental Health Act—provided the impetus for enactment of statewide community mental health acts in some 10 States to date—acts under which the State and its municipallites undertake the responsibility for the development of State and municipal support throughout the country for programs of social, medical, and vocational rehabilitation. The Federal Government will thus once more have demonstrated its unique role in initiating desperately needed services for large sections of the population, with the awareness that the impetus so provided would stimulate adoption of responsibility for these services by the State and municipal governments.

Mr. Elliott. Our next witness is Dr. John Eisenson, director of the speech center at Queens College.

STATEMENT OF DR. JON EISENSON, DIRECTOR, SPEECH CENTER, QUEENS COLLEGE

Mr. Eisenson. Thank you.

Mr. Elliott. Dr. Eisenson, where is your Queens College located? Mr. Eisenson. Queens College is in the borough of Queens, Flushing, N.Y.

Mr. Elliott. Mr. Eisenson, I necessarily have to limit you to about

10 minutes. You may proceed.

Mr. Eisenson. Thank you, sir.

Let me state briefly that I feel privileged to appear before the subcommittee and to offer the testimony, and that I am doing so in a joint capacity as a representative of the New York State Psychological Association and as a director of the Queens College Speech and Hearing Clinic.

I have prepared a statement which I would like to read.

Our growing and aging population has created an urgent need for rehabilitative specialists in the field of speech and hearing. The most conservative estimates indicate that by 1960 the incidence of persons with seriously impaired speech or hearing will approximate 9 million.

Specifically, the estimate for those with significant speech impairments, and by significant, I mean impairments that will compel attention and that will interfere with training, education, adjustment, vocational accomplishment, the incidence for those with speech is 6,164,427, and for those with hearing impairment, the estimated figure is 2,773,844.

During the past 25 years, the professional speech pathologist and audiologists have undertaken the work of rehabilitation of adults and

children with speech defects and hearing defects.

Colleges and universities have provided training for personnel.

The allied professions of speech pathology and audiology have developed so that today academic training is available in many of our leading universities.

Unfortunately, our training institutions cannot provide a sufficient number of trained personnel to meet the compelling needs of those

with excommunicative disorders.

The Office of Vocational Rehabilitation estimates that there is need at minimum of 1 audiologist and pathologist for 50,000 population to take care of those children and adults whose needs exceed the treatment provided in schools.

By 1960, this will mean that 7,366 speech audiologists and pathologists will be needed for persons of impaired speech and hearing who are not of school age or whose difficulties are more severe as to require more specialized attention than the schools can provide.

Twenty-five thousand speech and hearing specialists will be needed

in schools alone.

As of now, we have but a small fraction of the required number of

specialists.

The American Speech and Hearing Association estimates 2,000 certified and 5,000 uncertified specialists.

It may be unrealistic to hope that within a period of 2 to 5 years we can attract and train 32,000 specialists in the fields of speech and

We, however, set realistic sights for increasing our training goals so that your urgent needs can be met in 10 years if not 2, 3, or 4 years

I should like to recommend the following toward this end:

The expansion of present training programs in colleges and uni-

For the immediate present, the training of trainers should be em-

phasized.

For the most part, this would mean masters and doctoral programs in speech and hearing with courses to include related areas of physical,

emotional and mental handicaps.

Second, the expansion of physical facilities for the treatment of persons with impaired speech or hearing at hospitals, colleges, and university clinics and other agencies to serve the dual function of providing a place for training personnel as well for assisting those who themselves are in need of help.

Third, an increase in the total number of grants and in the sizes of the stipends for those students in graduate training programs who

continue the training at the masters and doctors level.

Stipend should reflect number of dependents as well as years of

training.

We are losing personnel because graduate students cannot afford to stay in their programs, especially after they are married and have

The establishment of subsidized internships and residences in ap-

proved training centers.

Such a program might parallel the one for the training of psychol-

ogists that is now widespread throughout the country.

In many communities, and perhaps in many States, the cost of such programs may be prohibitive. At least it is in the innumerable stages. House Joint Resolution 316 recognizes the urgent need for a

sharper increase in the number of speech pathologists and audiol-

ogists.

The New York State Psychological Association is grateful for the opportunities your committee has provided to permit me to appear to offer this brief testimony. As the director of a college speech and hearing clinic with a waiting list that almost always exceeds a regular caseload of approximately 200, I am personally grateful for your committee's interest in the needs of children and adults who are in need of speech and hearing rehabilitation.

Mr. Elliott. Thank you very much, Doctor. Are there any questions of Dr. Eisenson?

If not, thank you very much. Your testimony will be very helpful

and we appreciate it, Doctor.

Our next witness is Dr. David Kahn, director, psychological services and research, New York State Psychological Association.

STATEMENT OF DR. DAVID KAHN, DIRECTOR, PSYCHOLOGICAL SERVICES AND RESEARCH, NEW YORK STATE PSYCHOLOGICAL ASSOCIATION; ACCOMPANIED BY PAUL ROTTER, M.D., ASSISTANT TO THE SUPERINTENDENT, LEXINGTON SCHOOL, NEW YORK, N.Y.

Mr. Kahn. I am representing the New York State Psychological Association, sir. I happen to be director of the psychological services of the Lexington School for the Deaf.

I am not representing the Lexington School for the Deaf.

Mr. Elliott. For the purpose of the record, will the gentleman

accompanying you give his name?

Dr. Rotter. I am Dr. Paul Rotter, assistant to the superintendent at the Lexington School, and was asked to appear by the New York State Psychological Association.

Mr. Elliott. You gentlemen may proceed. Mr. Kahn. I should like to speak first to H.J. Res. 494, introduced by Mr. Elliott, and state that this resolution in general is supported wholeheartedly by the New York State Psychological Association.

My emphasis following deals with the important specific psychological areas which might be considered and incorporated into the

final bill.

I speak to title I, training teachers for the deaf, section 101.

In a statement concerning how grants-in-aid should be used by the institution involved, it might be well to include some provisions for the continued research aimed at evaluating and thus improving the programs for the training of teachers for the deaf.

There is some evidence to support the fact that the preparation of teachers of the deaf should include more courses dealing with such areas as child development, personality theory, abnormal psychology,

guidance, and other psychologically oriented courses.

A recent study conducted by Dr. Paul Rotter, which followed up approximately 70 trained teachers of the deaf, revealed that a large portion of this group received very little training in the above areas, either in undergraduate work or graduate work.

As of the present, very few schools for the deaf employ psychological

or psychiatric personnel on their staff.

It is probable that it will be some time before the smaller of these

schools make use of these services.

It would indeed be helpful if, in both theses smaller schools and in the larger ones which do employ psychologists, the teachers were aware of the psychological ramifications of the communication problems and the effects of these on family relationships.

The same resolution, section 105, it would be of great benefit, I feel, if the advisory committee on the training of teachers for the deaf were to include at least one psychologist who was well experienced in such areas as learning theory, perception, psychophysical methods, research and the psychology of the physically handicapped.

Section 106, the suggested appropriation of \$1.5 million for the years 1959 and 1960, appear to be somewhat inadequate for the total

program of training sufficient teachers for the deaf.

Along with maintaining scholarships, for which the cost is increasing, there is research needed to constantly evaluate these programs, there is a need for increased personnel for training and administrative purposes, and a need for more adequate facilities and equipment to be

utilized in these training programs.

House Resolutions 316, since House Resolution 494 introduced by Mr. Elliott supersedes resolution 316, and incorporated and adds to it, the earlier dated resolution, we should like to recommend that House Resolution 494 be considered as a replacement for House Resolution 316.

I have one statement concerning H.R. 3465. In general, this House bill is supported by the New York State Psychological Association. It is suggested, however, that section 203, page 16, section B, be amended to read as follows:

That all medical and related health services are prescribed by or under the formal supervision of personnel licensed to practice medicine or surgery in the

and I add—

that all psychological and related services are pescribed by or under the formal supervision of persons deemed competent to practice psychology—

and so forth—

in the State.

Thank you

Mr. Elliott. Thank you very much. Dr. Rotter, do you have any statement? Dr. Rotter. No. We put that in together.

Mr. Elliott. Thank you so much.

Our next witness is Dr. Margaret E. Condon, counselor with physically handicapped students, the City College.

STATEMENT OF MRS. MARGARET E. CONDON, COUNSELOR WITH PHYSICALLY HANDICAPPED STUDENTS, THE CITY COLLEGE, NEW YORK, N.Y.

Mrs. Condon. At City College of New York, which is like Queens College, Brooklyn, Hunter College, in that they are nonpaying, nonresident colleges in this city, we have had programs for physically handicapped students for many years.

City College, I believe, was the first. It was established in 1946. At the present time, I am working with about 150 physically handicapped students, chiefly blind, deaf, hard-of-hearing, postpolio, epi-

leptics, diabetis, and post-TB's.

These students are ambulatory. We have had to refuse many wheelchair cases at the City College because of our physical facilities.

We are an old college, about 110 years of age. We do not have many buildings with ramps and modern facilities. Some of our old buildings would be impossible for a person in a wheelchair to navigate.

So the wheelchair cases are referred to Hunter College.

In the last few years, we have been receiving a number of requests to send someone into this home to educate on the college level.

As a result of these many requests, the division of vocational rehabilitation on the homebound asked me to join with the community council of Greater New York last year to be on a subcommittee for meeting the needs of the homebound on the college level.

As a result of that year's work, we found that in the 168 colleges in the New York State area, there is nothing similar to the University of Illinois for a paraplegic or a double-crutched polio, who is non-

ambulatory.

We wondered, after investigating the program at Foster University for the homebound, which is done by tutoring, telephone, TV, and the person seen maybe twice a year for examinations, interviews, that this

is quite an expensive kind of education.

After looking into the work being done in Ohio State and the University of Illinois, we wondered if it would not be more practical in the area of New York to have a university similar to the University of Illinois for homebound college persons. We felt that we are losing a great many people with good minds if they are just allowed to sit home.

If we send somebody in to the home to test these people, send someone to tutor them, to educate them by telephone, by TV, that becomes a very expensive proposition. In fact, it amounts to about \$10,000 to \$15,000 per person. Whereas, if we had in this area a university similar to the University of Illinois, the person would be meeting with people of his own age group.

There is one boy now from Hastings, N.Y., at the University of Illinois, who said, "It is so good to talk with someone who isn't 20 or 30

years older than I am."

If we send somebody into the home to educate them, again they are isolated and alone. If we had a university in this area, they would be meeting with people of their own age level, learning how to live with this age level. To me, this is one of our greatest needs in the area of New York.

Are there any questions?

Mr. Wainwright. I would like to ask a question if I may.

Mr. Elliott. The gentleman from New York, Mr. Wainwright. Mr. Wainwright. Is not your suggestion, primarily, the type of institution you are suggesting, a State problem, as the State of Illinois University is entirely operated by them?

Mrs. Condon. The Federal Government, I am sure, gives a great deal to the University of Illinois. There are many \$250,000 research

programs connected with this kind of center.

Mr. Wainwright. But you are suggesting a university as such, or an institution, as such, to do the type of work you are describing. That would have to be started by the State, would it not, and then Federal aid would go to the State?

But originally would have to start with the State?

Mrs. Condon. Then what is the best way to get this type of thing?

Mr. WAINWRIGHT. I do not know. I am asking the question.

Mrs. Condon. We really don't know. The community council of New York worked on this all last year. We had Miss Gambel come down from Boston to see if this might be the most practical way to attack this problem.

We found this a very expensive way to do it. That might be better in a place like Stoneyrock, N.Y., or any area, particularly a university connected with a medical center. These people then could have physiotherapy and the various therapies, if needed. We are just looking for information. If you feel that we should pressure the State, we will pressure the State.

If we should pressure the Federal Government—we are only anxious that a university of this kind be started, because there are too

many people just doing nothing, with good brains.

Mr. WAINWRIGHT. Thank you.

Mr. Elliott. Thank you very much, Dr. Condon.

Our next witness is Mr. Cyril Wilcock, consultant, New York State Department of Education, Department for the Gifted.

STATEMENT OF CYRIL WILCOCK, CONSULTANT, NEW YORK STATE DEPARTMENT OF EDUCATION, DEPARTMENT FOR THE GIFTED

Mr. Wilcock. I appreciate this opportunity to talk to you this

morning, and tell you a little bit concerning my views.

Mr. Elliott. We are happy to have you, Mr. Wilcock. Let me say that as much as I regret it, could you give us your statement in about 10 minutes?

Mr. Wilcock. Yes, I can do that.

This outline is simply to facilitate the report that I am going to make. There will be a second report on the gifted, made by Mrs. Madeline Coutant, this afternoon. She will emphasize the specific recommendations of our group.

My statement has to do with giving you a little bit of an under-

My statement has to do with giving you a little bit of an understanding of where we are in the State and with regard to the gifted and some of the unmet needs. She will be more specific about them

later.

As I indicate in the outline, we are doing a good deal here in the State to meet the needs of the gifted and talented youngsters. We have in our own State education departments a special program for meeting needs in science, technology, and the education of the talented. In fact, we have a bulletin which has been published, which gives us a guide in this area.

We also have had a great deal of interest and effort by the New York State Teachers Association the American Association for the

Gifted Children, as well as increased local effort.

Without a doubt, as we review information in this field, we know that this State is one of the leader States in the matter of educating gifted children. We have some very specific programs that have been enacted by our own legislature in the last 2 years to help and advance this cause.

Under item 2, I indicate that the legislature has made a grant of \$200,000 available each of the last 2 years to encourage research and experimental practice in the field of the gifted. We have had over 175 requests for that kind of money, with enough money to finance

about 25 of them.

Here is an area that is crying for need.

Also, our own State education department, through the legislature, has been increasing regent scholarships for these talented and gifted students.

I have indicated the growth in my outline of the expected goal that the legislature is working toward in some year in the not too distant future. There will be about 10 percent of these regent scholarships

available for about 143,000 seniors graduated each year.

We have in this State some very unique programs that have been developed out in the rural areas. They become pretty well known, and established patterns for gifted youngsters. Some of those mentioned are Monroe County, Lewis County, Herkimer County, the Catskill area project and the Oneida area project.

As you know, in this State we have more schools for gifted and talented youngsters than any other State. They are mostly to be found

in New York City.

Mr. Elliott. How do you define a gifted youngster, Mr. Wilcock? Mr. Wilcock. Well, an intellectually gifted youngster is usually someone accepted at 125 or higher on an individually administered certified examination.

On a talented youngster, we tend to take the definition of Dr. Wyte, that anyone who performs in some talent area, like social leadership, arts, speech, about the 85th percentile of his own group naturally probably ought to be looked at and probably is gifted.

We don't have a better rule than this in the talents area because we haven't much research in this area. But these two guides help us

a good deal.

Chairman Barden. Are you beginning the appraisal in the high

school or in the college?

Mr. Wilcock. We are beginning in the elementary. We believe that earlier identification of these youngsters is necessary and more should be done in the elementary schools.

Some of the publications that I will leave with you for your examination, if you want them, spell out some of the things in our State bulletins that are being done in the elementary schools, where there

is considerable movement in behalf of these youngsters.

Most of it has been secondary, at higher education, but now we have a movement at the elementary level, believing that the later you wait the sorrier the results or the less the results will be, and especially in the areas of talents.

Apparently we have to get started much earlier in talents than

we heretofore have been doing.

Chairman Barden. From a practical angle, say the high school student qualifies as in the top group to which you referred. Then that student goes to college.

Mr. Wilcock. That is right.

Chairman Barden. How long must he be an outstanding student? Mr. Wπ.cocκ. Well, he should be an outstanding student each year, or he is very likely to be lopped off by the college, because he is probably under some scholarship aid, if not full scholarship.

Chairman Barden. Pursuing that further, suppose he is in such

financial situation that he must help himself in college?

Mr. Wilcock. Most colleges have some aid program, either through work programs or scholarship aids.

Chairman Barden. But very few of them, if any—certainly none that I have been associated with—have any fund where they could pay the total amount.

Mr. WILCOCK. That is right.

Chairman Barden. Would that boy or girl be expected to take outside work to support himself or herself to the extent necessary and still remain in the top bracket?

Mr. Wilcock. Yes; if he has any scholarship aid at all, he would be expected to. Otherwise, he would forfeit what he is getting.

Chairman Barden. Are you not expecting a lot from him?

Mr. Wilcock. I think it is a lot, but you asked me what is the situa-

tion. I think this is generally it.

Chairman Barden. From a practical angle, undoubtedly that boy or girl could remain in the top bracket with nothing to do but study. But from a practical angle, he or she has to spend a good part of the time when not in classes in providing the funds to stay in school.

Would you not wind up with more able men or more able women, and better rounded out men and women, even though they did not

remain in the top bracket?

Mr. Wilcock. Well, if you are asking me, I think it depends. It depends on the individual. I don't think you can generalize a thing of this kind.

I have seen some where some work experience has been very good

for them, and I have seen others where it has not been.

Chairman Barden. Have you ever seen anybody that it hurt to work?

Mr. Wilcock. No; I haven't, not generally speaking.

Pushing on, because I have a limited amount of time, we have, even though we are doing a great deal in the State, some unmet needs. I try to indicate those very briefly at the bottom of the first page.

We have a need to find teachers and increase and train teachers in

this field.

We are short in teachers in general, but we need more for the gifted.

We need more research in this area.

Here is where maybe some Federal money could help, because it is costly to do it, the kind of research that we need in this area. We have an unmet need of supplying additional special personnel for this kind of work.

We do need the help of a psychologist and a guidance person, and

so on, when dealing with people of those great gifts.

I have listed them in my outline.

I want to conclude by saying that we think we are making a good effort in New York State in behalf of these youngsters, but there are many unmet needs. The biggest problem we have to face is to find the money to accomplish what we feel we need in terms of some of these unmet needs.

As I said at the beginning, Mrs. Countant will appear later, and she will give you the specific recommendations of our workshop on

the gifted.

Thank you very kindly.

Do you wish any of these pamphlets?

Mr. Elliott. The gentleman from New York has a question.

Mr. Wainwright. This committee, every member who is here, worked on the National Defense Education Act. Title 5 of the National Defense Education Act specifically deals with the problem you are discussing today, the training of better guidance counselors, also training funds for the training of counselors, to determine who the gifted child may be. The philosophy that you have expressed here today was the philosophy that many of us hoped would be in the bill completely, but it was worded out.

Mr. WILCOCK. We appreciate titles 3 and 5, I want to tell you, very,

very much.

We hope something more can be done.

Mr. Giaimo. Are you asking for specific legislation and appropriation for gifted children, or are you arguing in general in favor of a general Federal support bill, such as we now have pending?

Mr. Wilcock. We are not talking against other children. We are

talking for gifted children.

What we are saying is we don't care if the grants are general or specific, but certainly there should be some provision for upgrading the instruction of gifted children.

Mr. Giaimo. What you are saying, in effect, is that you do need Federal assistance to provide such proper supervisors and trained per-

sonnel to take care of these problems.

Mr. Wilcock. We need some help in this direction; yes, sir.

Mr. Daniels. Who would set up the program, sir?

Mr. Wilcock. I think those should be left to the local communities and State education departments.

Mr. Daniels. Not the Federal Government?

Mr. Wilcock. No, I am sure not. I believe in the grassroots

Mr. Elliott. Thank you very much.

Mr. Wilcock. Thank you.

(The formal statement of Mr. Wilcock follows:)

(Formal statement of Cyril Wilcock, consultant, New York State Department of Education, Department for the Gifted)

"THERE IS NOTHING SO UNEQUAL AS THE EQUAL TREATMENT OF UNEQUALS,"-REPORT ON THE EDUCATION OF INTELLECTUALLY GIFTED AND TALENTED CHILDREN AND YOUTH IN NEW YORK STATE

INTRODUCTORY STATEMENT ABOUT THE PRESENT SITUATION IN NEW YORK STATE

1. Interest in the intellectually gifted and talented in the schools of New York State is very high at the moment and is likely to continue so for many years to come.

This is so because of-

(a) National concern about our perilous position in science at the moment.

(b) The National Defense Education Act which help better educate human resources.

(c) The New York Regents program for meeting needs in science, technology, and education of the talented.

(d) The interest and investment in effort of the New York State Teachers

Association and the American Association for Gifted Children.

(e) Increased local interest and effort.2. Without doubt, New York State is in advance of other States in providing for its gifted children and youth at the present time.

This is indicated by the fact that-

(a) The State education department in this State established the first position for the gifted, that of coordinator of education for the gifted,

3 years ago. During the last school-year, the coordinator helped establish

or further develop gifted programs in 94 schools.

(b) The New York Legislature of 1958 and 1959 made available a grant of money amounting to \$200,000 for each of these years to encourage and help finance promising experimental programs for gifted and talented students in school. Over 175 applications were received with money enough for but 25 approved projects.

(c) The New York Legislature recently increased the number of Regent scholarships from 7,385 in 1958 to 7,669 for 1959 amounting to \$10 million. (The Regents hope to someday offer scholarships for 10 percent of the

approximately 143,000 seniors each year.)

(d) The New York State Education Department has also developed helpful publications on the subject of the gifted designed to educate teacher and the public as to the need to do more for the gifted and talented.

(e) Local efforts in the State have been abundant and often outstanding, resulting in unique and promising program patterns, of national interest and acclaim, such as thos in Monroe County, Lewis County, Herkimer County, the Catskill area, the Oneida area.

3. All cities in the State have some provision for its gifted and talented in school, whether partial programs or rather full ones. Also, there are more special schools for the gifted and talented in this State than in any other.

4. One may conclude on the subject of the present provision for the gifted and talented in New York State that a great deal is now being done, more than in any other State, but there still remains much more to be accomplished, with money being the chief requirement for further advance in this important area of education.

UNMET NEEDS

1. New York State still has many unmet needs in the area of the education of the intellectually gifted and talented as follows:

(a) The need to increase and train teachers.

(b) The need to do more research.

(c) The need to recruit and supply additional special personnel services.

(d) The need to upgrade curriculum.

(e) The need to provide specialized books and other materials.

(f) The need to offer special "refresher" institutes to teachers of the gifted.

2. An indication of the unfinished nature of the task of educating intellectully gifted and talented students in New York State can be gathered from the following facts:

(a) At present, approximately 58 percent of the elementary schools in

the State have some provision for these students.

(b) At present, about 71 percent of the junior high schools of the State make some provision for these students.

(c) At the moment, about 90 percent of the senior high schools of the

State have some kind of program for these students.

(d) At present, the demand for help from schools and other educational organizations in the State, of the State education department and the office of the coordinator of education for the gifted, average about six letters a day and this load has about doubled each of the past 3 years.

CONCLUDING STATEMENT

1. The State of New York is now making a rather maximum effort in behalf of its intellectually gifted and talented students in school. There is a real and urgent need for additional financial help to permit the State of New York to completely develop a school program for these students. Costs for gifted programs in this State tend to amount to one-half again as much as spent for regular instruction. Mrs. Madeline Coutant, chairman of the committee for the gifted, of the Workshop, will later spell out the specific recommendations of our committee for your consideration and action.

Thank you very much.

Mr. Elliotr. It has just been called to my attention that we have visitors here in the hearing room from the New York Institute for Education of the Blind.

May I say to that class of students that we are happy to have you

visit these hearings.

Our next witness is Mr. Lee C. Dowling, director, Joint Legislative Committee on Mental Retardation.

Is Mr. Dowling here?

If not, our next witness is Mr. Joseph Weingold, executive director, Association for the Help of Retarded Children.

If he is not here, is Dr. J. Morrison Brady, medical director, Muscular Dystrophy Association of America here?

If Dr. Brady is not here, the next witness is Dr. Harry Sands, director of program of the United Epilepsy Association.

STATEMENT OF HARRY SANDS, M.D., DIRECTOR OF PROGRAM, UNITED EPILEPSY ASSOCIATION

Mr. Elliott. Dr. Sands, we are happy to have you.

Because of the large number of witnesses, we have agreed that we must limit each witness to 10 minutes. If you can summarize your statement to 10 minutes, we would appreciate it.

Dr. Sands. I think they can do it in 5.

I am Dr. Harry Sands, program director of the United Epilepsy Association.

I address myself to the field of neurology.

In neurological disorders, it is estimated it claims 20 million Ameri-Epilepsy holds a very central position in neurology, with an incidence of 1.5 million persons.

Eighty percent of the cases of epilepsy have their onset during early

childhood and adolescence.

I would like to limit my remarks to, one, the need at the moment as we see it in neurology in general, and epilepsy in particular, and then to extend my remarks to what can possibly be done about some of these needs.

At the moment, there are about 20 training units in neurology in the 179 medical schools in our country. There are less than 400 trained neurologists in the country at large to deal with the 20 million persons with neurological disorders, and this rather small group of trained neurologists has to deal with the vast problem of teaching, research, and manning the clinics, and, of course, patient care.

County after county in our Nation is devoid of any neurologists at all, so that general practitioners have no consultants to go to, so must

do the best they can with the knowledge they have.

Epilepsy in particular, despite the availability of anticonvulsive drugs, the last of which was introduced in 1928, only 20 percent of the epileptic population are on adequate medical treatment, many of them still receiving their medication from mail-order drug houses.

Partly this reflects the long time that it takes to get knowledge from

our laboratories to bedside care.

Partly this is reflected in the statements just made, namely, the few training facilities for neurologists in medical schools, and, in addition, these small number of neurologists in the country at large.

Mr. Elliott. Dr. Sands, I heard last year that the National Institutes of Health were about to announce some very fine method of treatment, or perhaps it was a drug, for epilepsy, but I never did hear whether or not the announcement of that discovery had been made. Do you know, Dr. Sands?

Dr. Sands. Yes, I do. I think you are referring to slutamenes and sparogenes that were being developed at the National Institutes of Health.

All of those in convulsive disorders had tremendous hope for this drug. We had hoped that it would break the barrier to our under-

standing brain metabolism.

Unfortunately, at this point our hope has not worked out. I think in research we must continue digging and digging for new hopes, those that will be stable and those that will sustain themselves.

The Institute is continuing the approach. Though this drug has not worked out, I think the magnificent thing about the studies is that the negative results are leading us to other areas of investigation.

At the moment, though, we still do not have a cure for the million

and a half persons with epilepsy.

Mr. Elliott. Thank you.

Chairman Barden. May I pursue that a moment?

Is the Federal Government now contributing to the research work

that you referred to?

Dr. Sands. Yes. The research work that I just referred to has been supported very liberally by the Institutes of Neurological Disorders and Blindness, both in their own program and in universities and medical centers throughout the country.

This, of course, has its impact on a community level where persons with epilepsy, both the child and the adult, are forced to live on the edge of impossibility, if you will, in that they are kept out of schools in many communities due to lack of knowledge on the part of the

teachers, and administrators and the community at large.

Also, on the adult level, it means that we have a vast pool of our labor force that have convulsions that are kept out of employment when they make it known that they have epilepsy or a history of epilepsy is uncovered.

This, in general, is the problem. I am sure I am not telling you

anything that you don't already know.

What can we do about the crucial needs? It seems to me that we must step up the training of neurologists, or else much of the research that we are supporting may remain in the archives of neurology and may go to naught, unless someone is there to apply this newly gained

knowledge and to apply that as rapidly as we assemble it.

Another need which stems from this preamble is the development of regional clinics to disseminate the newest knowldge and to disseminate to our physicians, and to put these regional clinics in the position where they disseminate this knowledge through better patient care, so that there would be a shorter gap between discovery and patient care.

It just takes too long between the time that we have the knowledge and the time that it gets down to good treatment.

I should think that the establishment of these regional clinics

would do just that.

Then the introduction and extension of mobile diagnosis and consultant clinics to assist the practitioners in the rural clinics.

Again it is the way of disseminating our knowledge to patient care.

Certainly these physicians that operate in rural areas away from the large medical centers need some kind of diagnosis and consultative help until we have adequate neurologists to be present in all counties.

Mobile units would certainly help enormously. The complexity of neurological knowledge, the complexity of all knowledge in our current society, requires a specialist to be present in governmental agencies, such as the Division of Vocational Rehabilitation, in school units, in all the service units that are trying to help the disabled. These specialists would help not only through consultation directly in the services being offered by the agency, but would keep them abreast with the new and modern knowledge.

Again, it is the shortening of the gap between the acquisition of

knowledge and good patient care.

It seems to me on the research level we need to augment what we are doing so very well now, augment through the establishment and extension of the notion of supporting men, careers, careers in research.

In addition, supporting laboratories, not just specific studies, but laboratories that are very much like our libraries, repositories for equipment, repositories for technicians, so that when investigators who are working within these universities have notions, they need not apply for a grant to some voluntary or Government agency, but it would be very much like getting a book, to go down and test some of their hypotheses, while they are still enthusiastic about it.

Of course, many of these notions will not pan out. We see that

in research all the time.

But for the one or two notions that can be pursued this way, without filling out long forms, whether it be from a voluntary health agency or from a public granting agency, I think this would reward itself enormously.

Then in the area of employment, some agency ought to review the health standards used in employment, both on the civil service levels.

Federal, State, and local, and on the industrial level.

How realistic are our health standards when they come to em-

ployment, on any level?

It seems there if we could review these health standards in terms of our current knowledge, we might open up a tremendous number of opportunities for our disabled people.

The last recommendation I would make is an increased public information program about our new knowledge. It seems all of us on clinical teams are so patient orienters that that we feel rather guilty if we take time off to do anything else, but look at a patient.

But so many of the stumbling blocks exist by a wall out in the community, a wall which consists of misinformation, a wall which con-

sists of old, antiquated ideas.

In epilepsy, we are still operating under medieval ideas. I think the best people to carry out the public relations programs are the very technicians who know the problem not abstractly, but in terms of feeling, in terms of suffering.

These people ought to be supported and allowed to be articulate to

a community and bring their knowledge up to date.

This knowledge ought to be in archives in neurology, ought not to be the private property of doctors. It ought to be everybody's property.

In this way, I think we would shorten the task of meeting the complex problem in neuroolgy, and perhaps this has application to all our problems.

Thank you very much.

Mr. Elliott. Thank you, Dr. Sands.

The next witness is Dr. Joseph Weingold, executive director, Association for the Help of Retarded Children.

STATEMENT OF JOSEPH WEINGOLD, EXECUTIVE DIRECTOR, ASSO-CIATION FOR THE HELP OF RETARDED CHILDREN

Mr. Elliott. We are happy to hear you, Mr. Weingold, and request that you limit your presentation to 10 minutes.

Mr. Weingold. Thank you.

I am speaking today as a representative of the New York State Association for the Help of Retarded Children, which is one of the State affiliates of the National Association for Retarded Children.

I am not speaking as a representative, a direct representative of the national association, who either did or will appear for themselves.

Our own association consists of 32 chapters, growing to that size from about seven members in the last 10 years, representing about 90 percent of the population of New York State, and speaking on behalf, I should say, of most of the mentally retarded and their parents in this State.

We operate and support a complex network of services, mostly with

funds that come from the general public.

These services include preschool classes, classes for children who do not qualify for public school classes under existing law, recreation, camping, vocational rehabilitation, sheltered workshops, parent coun-

seling, and education, public education, ad so forth.

In the year 1957, for example, our association spent over \$1 million on these services in New York State. In addition to this, we operate five sheltered workshops, four of which have received grants from the State by way of section 3 funds under Public Law 565; and in New York City one sheltered workshop which is a research project under a 5-year grant from the Office of Vocational Rehabilitation, now in its fifth and final year.

This grant has been used as the prototype for all similar grants for sheltered workshops for the mentally retarded throughout the

country, supported by OVR funds.

In addition to these, we are also the recipient of a grant from the Office of Vocational Rehabilitation for workshops in training of professional personnel in the field of vocational rehabilitation.

I have conducted three such workshops with Professor Abramson

in the last three summers.

Although there are over 300 classes which we operate, and other educational services, which makes us keenly aware of the needs in the other fields—teaching training, and so forth, space—I want to limit myself to the vocational rehabilitation aspects of this study.

I am sure that I need not go into the value of the work that has already been done by the Federal Government through the Office of Vocational Rehabilitation in State governments. We all know that from 531 mentally retarded persons rehabilitated in 1955, in 1957

there were 1,094 rehabilitated; and in 1959, it is estimated that 1,750 will be rehabilitated.

The earnings similarly are dramatic as compared with what these

people earned before rehabilitation.

But when we consider that period—for example, when 1,700 mentally retarded persons were rehabilitated vocationally through Federal-State programs, there were 80,720 in the total rehabilitation who achieved rehabilitation—we can see how small a portion this large group is in this success story, and how much more has to be done.

I have several suggestions with regard to these matters. One that concerns us very, very much is what is going to happen to these programs now supported by OVR, and/or State grants under section 3.

These are section 4 and section 3 grants under Public Law 565.
Millions of dollars have been and will be spent on setting up such services. The public, through the voluntary agencies of the States, matches the one-third to two-thirds, and in the case of section 3 funds it is one-fourth to three-fourths.

After 2 years, 3 years, 4 years, or 5 years, the theory is that the public will take up the slack, and that we will have sold this to the

general public and they will continue.

Regrettably, I must say that this is proving unrealistic. The nature of this handicap is such that most of these workshops must con-

tinue to operate at considerable financial deficiencies.

Somewhere along the line, the voluntary agency who is willing to do as much as possible must be helped for a continuing operation if we are not to lose most of the effect of the millions of dollars that have

already been spent.

Whether this is a Federal function or a State function is open to considerable debate. It may be that the Federal Government might set up some scheme whereby funds would be siphoned into the States for continuing operation; or, on the other hand, as was brought out in our study group—and I don't want to repeat that now as I am sure it will be said—some method of stimulating and pushing the States into undertaking this task and duty might be devised.

It might be a reallocation or refocusing of section 2 funds. Instead of purchasing individual services, as is now the case, they might make lump-sum payments to voluntary agencies who would contract to service up to a certain number of handicapped during the year.

There is a lot of precedent for that. For example, in New York State, through the youth board, the wefare services and others. In any case, it seems to us that unless something is devised to help the voluntary agencies, not entirely, but on some grant-in-aid basis, to continue the operation of these workshops, these services may be curtailed and in many instances may even have to stop.

Is this worth while financially? That is always important.

In as highly a specialized workshop as ours in New York City, which is research oriented and, therefore, more expensive than it would be for a straight service operation, that costs us a little less \$1,000 per retardate per year.

The costs of institutionalization in New York State is \$1,800 a year solely for care, without any funds for capital construction, retirement,

obsolescence of buildings, and so forth.

So there is a net saving of \$800 per year somewhere, to some taxpayers, over a period of maybe 20, 30, or 40 years, because the life expectancy of the mentally retardate today is very near that of the normal person.

That is the first proposal.

The second proposal I would like to make is in regard to section 3 funds under Public Law 565, now known as extension and improve-

ment.

We have received four such grants in New York State. If we got more of them, we could operate and we, as an agency, would be able to stand the difference, financially, at least four more sheltered workshops in this State and perhaps more.

But we are told on the State level that there are no more funds

available.

We suggest, therefore, that some thought be given to increasing the funds made available to the States, or a reallocation, rather, than on a population basis—reallocation of these funds under section 3 rather than on a population basis as now exists, so that those areas who are ready to move will receive the aid to do so.

This may be New York State, or California, or Nebraska.

It so happens that I know we are ready. Others may be just as ready, and yet haven't got the funds.

That is the second suggestion I have to make with regard to voca-

tional rehabilitation.

The third point that I want to take up in the few minutes left to me is the independent living bill, which you, Mr. Elliott, have introduced in Congress, in the House of Representatives.

I think that this is probably the second great advance in the field.

of rehabilitation of the handicapped.

The first, of course, was Public Law 565, and its predecessors. It is the logical step to take if we are going to think of rehabilitating or

servicing those who are more handicapped.

It goes without saying that there are hundreds of thousands of handicapped individuals for whom there is no realistic vocational rehabilitation goal who could be helped so materially that it would result in substantial savings to taxpayers. Those are the people who might go into institutions, people who need attendants. Certainly a large number, a significant number are the mentally retarded.

This came home very strongly to us in our association because, as chairman of the national association's vocational rehabilitation committee, I got these letters from all over the country: "What do we do with the youngster who cannot function in a sheltered work-

shop?" and so forth.

I think this bill is aimed at it, and I think it is a wonderful thing. But on very careful study of the bill, I find, and I may be wrong, that the implementation of the philosophy is contained in "Title 3—Work-

shops and Rehabilitation Facilities."

All the rest of it is administration, how the funds are going to be used, and so forth, and I submit that the services that are contemplated to achieve the aims of independent living will not—I stress, will not—do this for the mentally retarded.

The language of the bill, speaking of workshops and rehabilitation facilities, follows very closely the wording of Public Law 565 in the same regard, and if that is so, why didn't we then extend the definition of feasibility under Public Law 565 and get all these people under that law without the need for an independent bill?

Of course, I don't think Public Law 565 can, or was, designed to deal with this type of handicapped person. I feel very strongly we

need this new type of legislation.

But our experience has shown that we must think in terms of a new concept of rehabilitation service for this type of severely handicapped individual.

Such a service is more in the nature of a social development center or, if you will, a habitation center for the mentally retarded that will help such individuals to care for themselves as much as possible, utilizing their inate capacities and meaningful use of their day to the end that they will require a minimum or no help from members of their family and may not have to be institutionalized.

Mr. Elliott. Mr. Weingold, I will have to call time on you. Your

statement will be made a part of the record at this point.

Mr. Weingold. Thank you, sir.

(The statement referred to follows:)

STATEMENT BY JOSEPH T. WEINGOLD, EXECUTIVE DIRECTOR, NEW YORK STATE
ASSOCIATION FOR THE HELP OF RETARDED CHILDREN, INC.

Mr. Chairman and gentlemen, it is a great honor and privilege to have been invited to testify before this distinguished committee on the most urgent needs, national and local, as we see them, in the fields of special education and rehabilitation.

Since there are many who will have testified before this committee on the subject of special education, I should like to limit my remarks to the field of rehabilitation and some observations on the "independent living bill," H.R.

3465, introduced by Mr. Elliott.

The Association for the Help of Retarded Children is a membership corporation consisting of parents and friends of the mentally retarded. Started with 7 parents in 1948, we have grown to 32 chapters representing more than 90 percent of the population of New York State and with more than 10,000 paid family memberships. During this time the association through its chapters has established, is operating and supporting a network of services in New York State, mostly through public giving, including preschool training for the mentally retarded, classes for those not eligible for existing public-school classes, recreation programs, camping, vocational rehabilitation, sheltered workshops, placement and counseling, information services to the parents and parent education, and public education. In 1957, the association through its chapters spent almost \$1\$ million on such services.

In New York State we operate five sheltered workshops, four of which have received grants from the State by way of section 3 funds under Public Law 565, the Vocational Rehabilitation Act. In New York City, the New York City chapter operates a research project in the vocational rehabilitation of the mentally retarded through a sheltered workshop operation with a grant from the Office of Vocational Rehabilitation which is now in its fifth and final year. In addition, we have also received grants from the Office of Vocational Rehabilitation in the training of professional personnel in the vocational rehabilitation of the mentally retarded and for the past 3 summers I have conducted such worshops in cooperation with Teachers College and Prof. Abraham Jacobs

during the summer.

Although our 100 classes or more that we operate in the State makes us keenly aware of the need for teachers, space, curriculum development, and the many other matters that I am sure you have heard about in the field of special education, our specialized experience in the field of vocational rehabilitation qualifies us, perhaps, more to speak in that area. May I say that we have had the most cordial relationships with the Office of Vocational Rehabilitation on a national and local level and the State and local divisions of vocational rehabilitation. The aid that we have received from them, in money and counseling, has been of

invaluable help in developing what we consider to be one of the most dramatic programs in vocational rehabilitation of the handicapped that we have seen in this country. Our experience, however, has made us keenly aware of what might still be done.

I am sure that no one will question today the value of the work that has been done in the field of vocational rehabilitation and the great place that the Office of Vocational Rehabilitation and Federal legislation has had in this development. In the year 1955, for example, 531 persons were rehabilitated vocationally through the Federal-State program. They earned \$24,000 before rehabilitation and \$825,900 after rehabilitation. Coming down to 1957, 1,094 were rehabilitated who earned \$1,851,600 after rehabilitation as against \$44,700 before; 1959, it is estimated that 1,750 mentally retarded persons will have been rehabilitated. A similar dramatic progress can be shown for those who were rehabilitated who had a psychosis, the emotionally disturbed, etc. When, however, we compare these figures with the total number of all handicapped rehabilitated, 57,981 in 1955 and 80,720 in 1958, we can see how small a number the mentally retarded are. We must, therefore, seek ways to bring these services, even more meaningfully, to more of this terribly handicapped and large group.

One of the things that concerns us very much is what will happen to these many facilities and sheltered workshops that are being financed by the Federal Government after such grants cease. We know that the theory is that the community will take up this slack, but we find that these workshops are operating, because of the intense nature of the handicap, at various degrees of financial

deficiency.

We should, therefore, be thinking of ways to continue these projects and services, and even expand them, beyond the time when the Federal grants cease under the law as it now exists. Millions of dollars have been spent and many more will be spent on starting such projects, financing research, and nursing them along for a period of time. It seems to us that if they were to be dropped, if services were to fall off or even cease, after Federal grants have ceased, we well may be accused of having spent money in vain. Of course, if not another thing is ever done by the Federal Government, I think that a great work has already been accomplished. It is not in our nature as Americans to rest on our

laurels. Hence this inquiry and the searching in which we join.

We should like to propose, therefore, that some thought should be given to make available funds to voluntary organizations and the States or to voluntary organizations through the States, for the continuing operation of workshops and rehabilitation facilities for the mentally retarded who have met desirable stand-I submit that in one way or another government, either on a Federal, State, or local level, pays for these people whether it be through vocational rehabilitation or final institutionalization in view of the lack of such rehabilitation services. On a dollar-and-cents basis it has been demonstrated over and over again that it is cheaper to provide a vocational rehabilitation service and sheltered workshop for a handicapped person than to institutionalize him. comparative costs are quite astounding. For example, in New York State it costs \$1,800 a year to maintain a mentally retarded person in a State institution. This cost does not include capital construction, retirement of employees, reserve for depreciation, etc. This is a cost solely for maintenance and some other services. As against this, in a highly specialized service such as the sheltered workshop of the New York City chapter of the AHRC, which is research oriented, the cost is a little less than \$1,000 per client. This results in a net saving of \$800 per year (and the life expectancy of the mentally retarded is very near the normal today). In addition to which, the mentally retarded who obtain employment through such service become taxpayers and even those in the sheltered workshop are earners instead of total consumers.

Another proposal that goes along with this is that more Federal funds be made available under the extension and improvement section of Public Law 565 when States surveys show the need for more sheltered workshops or rehabilitation facilities for the mentally retarded. This was very fully discussed, as were many other matters, by my section on mental retardation in the study group in preparation for this committee hearing. I will not press this any further because the statement with regard to the matters we have discussed will be made by someone else and include some of the things I have said here as well as others.

I do feel it important, however, to have stressed what I did concerning the continuing operation of sheltered workshops. I should like also to address myself to something of extreme importance to us in the field of mental retardation,

the "independent living" bill.

I think that the concept of this bill is the second great advance in the field of rehabilitation of the handicapped. The first, of course, was the Public Law 565 and its predecessors. Here at last we are coming to grips with the whole question of the severely handicapped for whom vocational goals are not possible to obtain and unrealistic to set. This bill, if enacted, and properly implemented, will result in keeping in the community on an independent level many, many thousands who otherwise would be institutionalized or require special expensive attention usually borne by the State. There is no doubt in my mind, as well, that this measure and its implementation may result in bringing back into the community many of the mentally retarded who previously were considered terminal institutional cases; especially if residential facilities for them in the community are supplied. Again the costs of these community facilities as compared to institutional placement and care are much less.

I should like to point out, however, that although the findings of fact and the declaration of this bill are extremely broad, have enormous philosophical implications, the portion of the bill which seeks to implement this philosophy will not, in its present form, accomplish the purpose. The portion of the bill which treats with the services other than evaluation, etc., is "Title III—Workshops and Rehabilitation Facilities." What seems to be contemplated as the services which will accomplish the purposes of the act is the establishment of workshops and rehabilitation facilities. Language of the act in speaking of workshops and rehabilitation facilities follows very closely the wording of Public Law 565, which is the Vocational Rehabilitation Act. I respectfully submit that for the mentally retarded the establishment of a sheltered workshop or a rehabilitation facility as defined in this act will not accomplish the purpose, nor would this act be necessary if that is the only type of service that will be offered. It seems to us that the Vocational Rehabilitation Act can supply the services that seem to be contemplated in H.R. 3465 if we broaden our philosophy concerning feasi-

bility of the handicapped.

Of course, I don't think that Public Law 565 can or was designed or should deal with this type of handicapped person. I feel very strongly that new type of legislation is necessary and that the purposes of the independent living bill are quite wonderful. Our experience has shown, however, that we must think in terms of a news concept of a rehabilitation service for this type of severely handicapped individual. Such a service is more in the nature of a social development center, or, if you will, a habilitation center, that will help such individuals to care for themselves as much as possible, to utilize their innate capacities to their limit and to be brought together for social and occupational activities and meaningful use of their day to the end that they will require a minimum or no help from other members of the family in daily living and will be able, if institutionalized, to return to the community or if in the community remain there since they will be a minimum burden on society. This is the minimum goal for the mentally retarded. An extension of this goal might be meaningful or even some remunerative work, but this depends on the capacity of the individual and how he will develop. It must not be made as an initial goal and, therefore, I respectfully submit that the concept that a sheltered workshop or rehabilitation facility as is now in the proposed bill will not answer the purposes of the bill and the philosophy it intends to implement.

We have been keenly aware of this problem and especially myself, because of my relationship with the Office of Vocational Rehabilitation through the research grant for our workshop in New York City and my correspondence with the many workshops throughout the country. In addition, for some time I was the chairman of the vocational rehabilitation committee and sheltered employment committees of the National Association for Retarded Children. Everywhere, wherever there were sheltered workshops set up, the question was asked, What are we going to do about these individuals who cannot adjust to a sheltered workshop, function too low, perhaps, and will never achieve a vocational objective? In answer to this and because of the many needs as expressed to us through applications of parents and their children, this association began such a service which we call an Occupational Day Center on East Fifth Street, in space that was contributed to us by an organization in Manhattan. We are at this time, I am happy to say, the recipient of a 3-year mental-health-project grant from the National Institute of Mental Health for the development of this project and to demonstrate its usefulness for the rest of the country. It is a project such as this that must be provided for in any act that seeks to rehabilitate or, as I said before, habilitate the mentally retarded who were included in: the more severely handicapped. I am attaching a copy of the original proposal as made to the National Institute of Mental Health as exhibit A for this committee. You will note that this is intended for a population who (1) is unable to participate in the social life of the workshop, apart from work: (2) is functioning at intellectual levels so low that they cannot appreciate the activities of the workshop; (3) do not join in any meaningful groups; and (4) for whom only special kinds of work, if any, are suitable. These are the youngsters who are presently considered unfensible for vocational rehabilitation and are presently potential institutionalized retardates in view of the lack of community facilities available. For them, I must repeat, the sheltered workshop and the rehabilitation facility is not the answer. The answer lies, we believe, in a different type of service as exemplified by what we are doing under the grant from the National Institute of Mental Health.

In closing I should like once more to compliment and congratulate this committee on the wonderful work that it is doing. I had the privilege of attending the workshop on mental retardation as a participant in preparation for this hearing and was amazed at the breadth and depth of the considerations there brought forth and the conclusions drawn. I am sure that much, much good will come of this inquiry and stand ready to cooperate in every way possible when

ever called upon.

Ехнівіт А

PROPOSED PLAN AND SUPPORTING DATA FOR OCCUPATION DAY CENTER FOR MENTALLY RETARDED YOUNG ADULTS

A. SPECIFIC AIMS

1. The problem

Since the resurgence of interest in the mentally retarded, beginning in 1949, there has been a great effort to improve services for the mentally retarded, in and out of institutions, with special emphasis on the development of community facilities. Sparked by the enormous growth of parents groups, more and more classes are being organized for the so-called "educable" child, generally with IQ's over 50; there is a growing concern for the retarded of lower intelligence, generally with IQ's under 50 labeled "trainable" for educational purposes; the 1954 amendment to the Vocational Rehabilitation Act (Public Law 565) enabled many of the parents groups to start vocational rehabilitation and sheltered workshop programs for the retarded adults. But, although such services are part of a "cradle to the grave" program, the emphasis until now has been on the school age child and on those adults (not yet in depth) who are feasible for a vocational training program. It has become evident to us, through our programs for the adults in New York City, Long Island, Westchester, Utica, Watertown, and in many of our other 32 chapters in New York State, that these are adults for whom these programs are not the answer.

This significant group is identified as those not now eligible for the type of activity for which sheltered workshops are designed. This group has certain characteristics identified by us in our various workshops, and in the more than 70 such workshops established throughout the country. These retarded—

(1) Are unable to participate in the social life of the workshop, apart from work;

(2) Are functioning at intellectual levels so low that they cannot appreciate the activities of the shop;

(3) Do not join in any meaningful groups:

(4) For whom only special kinds of work are suitable;

(5) Who tend to be in the group who measure under 40 IQ (although

some may be above).

During the year 1957–58, the AHRC in New York City alone received more than 7,000 requests for services. Almost 20 percent of these were for postschool age retardees, 17 and over. These have been the most difficult to help in terms of meaningful programs to help the parents, if they so desire, keep them in the community. Dr. Gerhart Saenger, in "The Adjustment of the Severely Retarded in the Community," a study of former pupils of low IQ classes in New York City from 1929 to 1956, points out that parents tend to think more and more of institutionalization as the child grows older. Thirteen percent were considering institutionalization in the 17 to 20 age group. This goes up to 15 percent in the 21 to 25 age group and 21 percent in the 26 to 30 age group. In almost every instance the answer to the question "Why?" is "There is nothing for him to do in the community and I can't take it."

This lag in services for the adults described becomes more and more evident as services for the school age and evidently vocational feasible adult retarded are developed, since many children in such services, who otherwise might have been institutionalized at an early age, now remain at home and grow to adulthood in the community. For example, although almost 50 percent of the reported school age retarded with IQ's under 50 in New York State are in institutions, of the 124 children in the classes operated by the AHRC (1957–58) only 9 were institutionalized.

If the trend is toward keeping the retarded at home and we are building community services to accomplish this, a most significant group will be deprived of the opportunity to achieve whatever they can and be left by the wayside unless a program is devised to help them realize their potentials to become as independent citizens as possible in their own homes, at least. As a community agency, we feel it is the height of cruelty to advise parents to keep a youngster at home, help the family "adjust," without a direct service to the child.

2. Aims of the proposed work

(a) To establish a day center in the community for late teenage and young mentally retarded adults who are (1) presently considered unfeasible for vocational rehabilitation, (2) presently considered to be functioning at a level too low for participation in any existing community program for mentally retarded adults, (3) presently residing at home and devoid of any service related to training or rehabilitation, (4) presently considered potential institutionalized retardates in view of the lack of community facilities available.

(b) To help the retarded remain in the community by providing a socially acceptable way for them to spend their days. Society, and parents, perhaps, do not accept the adult who stays at home all day watching television. The socially acceptable behavior for adults is to leave home in the morning to engage in an acceptable activity and return in the evening. This is minimum and basic.

(c) To train the retarded in the skills of daily living, such as traveling alone, homemaking, good grooming, constructive use of leisure time, etc., in brief to bring him to the point of requiring a minimum or no help from other members of his family in daily living.

(d) To ascertain the extent of growth possible as a result of such training.

(e) To determine the significance of such training to the ability of the individual to function better in the community or, if he is institutionalized, in an institution.

(f) To help the parents to develop greater positive attitudes toward the retarded adult in the family.

(g) To reduce significantly the anxiety level of parents.

(h) Change significantly parents' attitudes toward institutionalization.

(i) Through this plan to devise training methods, techniques, and procedures

that can be used by other communities and the institutions.

(j) To work with the public schools to develop curriculum for the youngster retarded of this level. Public schools are more and more being charged with the responsibility of training these retarded until the age of 21. From the age of 17 to 21 this is an untried area for them. We believe a cooperative effort will aid the public schools develop programs as the sheltered workshops are beginning to do for the higher grade retarded late teenagers in school.

(k) To explore who should have the responsibility for such community programs. Should mental hygiene departments begin to think of community facili-

ties such as these under their auspices?

(l) To explore the functions of various professional disciplines in such a program.

B. SIGNIFICANCE

In the last 10 years public-school classes for the retarded have grown greatly (in New York State from 34 to 128 classes for the "trainable" children and from 1,200 to over 1,600 classes for "educable"). In addition, almost all of the more than 600 parents' groups in the United States maintain classes for the "trainable," and some of the "educable." Thus, more and more retarded adults with some early training and a more vocal need for services are beginning to appear. The sheltered workshops, beginning to provide vocational training and sheltered employment, are discovering youngsters unsuited for that program.

The classes for the "trainable," as well as "educable" are now confronted with the problem: How and toward what shall we train the retarded in our

schools from 17 to 21? The sheltered workshops already are asking: What will we do with the young adult not yet, or who never will be, ready for a workshop? Parents say: "I want to keep my child at home, but what is there for him in the community?" Social and State agencies ask: "Whose responsibility is this? What will it cost? Will it achieve the results?"

A program such as we here describe, working with the retarded and their families over a period of time, will, we hope, come up with many of the answers

to these questions.

If we can show how a community day center can provide a training program resulting in significant positive changes in adult retardates who presently are considered infeasible for existing community programs; how such services can be used to alter famly interrelationships, changing parents' attitudes toward institutionalization or supporting their desire to keep their children at home, it may set a pattern for similar services elsewhere.

An analysis of the professional personnel needed and their functions, costs, transportation, and how to accomplish the desired results, methods, and techniques, will lay the groupwork for voluntary and perhaps State agencies faced with this problem to enter this area of service. By demonstrating their practicability and results, the methods used will, hopefully, aid the public schools

to develop programs for the 17 to 21 in this group.

Although the primary aim will be to keep the retardate in the community, we anticipate a secondary result we have already seen achieved with some of the younger retarded. There is no doubt that even with optimum conditions, many retarded will have to go to institutions. It is axiomatic, we believe, that a retarded person, younger or older, is a better citizen in the institution if he is trained in some of the areas indicated. Furthermore, he is less expense to the State in terms of the persons needed to care for him. The child who is tollet-trained is an entirely different problem from the child not toilet-trained; thus, too, the adult who can care for himself completely, knows how to work with others, can contribute to the economy of the institution by making beds, sweeping, etc. is a more acceptable member of that society.

In addition, we hope that some of the techniques developed, and results shown, will be used more hopefully by the institutions for their own populations. An examination of the institutions in New York State, and others we have seen, reveals a dearth of training, other than some occupation therapy, for this group of preponderately middle-grade adults. We hope to show that these can be trained to lead more contributing and meaningful lives in the institutions.

The example of the AHRC Training Center and Workshop is perfectly in point. Through this demonstration, dozens of other workshops were started in the country; the needs of the adult retarded are being translated into curriculum for the "educable" 17 to 21 in public schools; and institutions in New York State, at least, are beginning to parole out some of the retardates for training who previously had no such opportunities available.

C. FACILITIES AVAILABLE

Sufficient space has been made available to the project by the Daughters of Israel, who own two three-story buildings on East Fifth Street, Manhattan. This space includes two kitchens, large rooms for training program, offices, toilets, showers, outdoor play area, and space to set up a complete apartment. Centrally located, it will permit us to get our population from four boroughs.

The association now has an ongoing program, including liaison with 3 clinics in New York City, 11 classes for "trainable" children; recreation and group programs for over 300 adults; a camping program; a sheltered workshop serving about 95 adults a year; parent-education courses; and a guidance, counseling, and referral service. There is a complete staff in the classes, including education experts, psychologist, and speech-developmentalists. The sheltered workshop has a complete staff, including a vocational rehabilitation counselor and social worker, developing group programs specifically for the retarded adult. Our advisory board includes outstanding persons in all the disciplines dealing with the retarded.

Staff from all programs as well as central administration will be available tocooperate in this program. All consider this an integral part of developing a program of services for the mentally retarded.

D. METHOD OF PROCEDURE

It is proposed that between 50 and 60 mentally retarded young adults (male and female) will participate in this program 5 days a week, from 10 a.m. to 4 p.m. The population will be obtained through publicity containing the specific aims of the programs, the waiting lists of the AHRC, and referrals from the board of education. It is also proposed to try to get some of the population from the department of mental hygiene to see whether the program can bring some now in institutions back into the community. These, of course, would have to be selected for parent cooperation.

Screening for admission

Initial screening will be done by-

1. Questionnaire developed to give us some subjective evaluation by the parents of the retardate's functioning (appendix A). We shall also obtain pertinent data on schooling, medical history, and psychological examinations, if any.

2. Personal interview of the candidate and parents by the social worker. The social worker will take a family history, interpret the goals of the services to the family, and begin to establish an ongoing relationship with the retardate and the family. The social worker will also prepare signifi-

cant material for referral for the psychological examination.

3. A psychological examination of the candidate will be administered to determine his intellectual functioning, social and personal adjustment. Special emphasis will be on social development as revealed by Vineland Social Maturity Scale in relation to the mental age of the retardate. Before final admission, a staff conference will be held between the director, the social worker, the psychologist, and the work supervisor, at which some initial goals and indicated areas of capability as well as disability will be discussed and set.

The general criteria for admission will be—

(a) That the candidate be of post school age (approximately 17-25).

(b) That the primary disability be mental retardation.

- (c) That the candidate be ambulatory and able to take care of his bodily needs.
- (d) That, in the opinion of staff, the candidate is not ready for a vocational rehabilitation program. This is not a black and white matter, but the years of experience that our staff at the sheltered workshop have had with this type of individual leads us to believe that the results of our testing and interviews plus a staff conference may well give us at least the initial setting for this youngster. If proved incorrect, he can be moved from the occupational center to the workshop. The reverse process may also be utilized.
- (e) That the candidate can follow simple directions and communicate, verbally or otherwise. By following simple directions we mean able to respond to a command such as, pick up the broom, or go upstairs and tell Mr. So-and-So to do so-and-so, or let us wash the dishes, or it is now time to make the beds, etc.

(f) Secondary disabilities, such as epilepsy, blindness, cerebal palsy, etc., will be accepted if not of such severity as to eliminate changes for group participation.

In cases where we are not sure, we are allowing for a period of trial, where we can make some subjective evaluations on the basis of observation within the facility itself.

After admission

We must bear in mind that much of what we will learn will be by trial and error. We have learned a number of things, however, from our other projects as a basis to begin.

1. Evaluation.—The objective of evaluation is the assessment of the individual's strengths and weaknesses through observation. Since the individual's ability to adjust is inextricably bound up with total personality, especially for the retarded, this diagnostic process is also concerned with identifying those personal difficulties which appear to limit the individual's performance. The specific objectives in evaluation are (a) to identify the individual's specific assets and limitations, (b) determine whether the individual can perform and the

degree, (c) to test the initial individual goals to some extent and revise or confirm them and form an objective for a program of training.

The means of evaluation are interpretations (a) of objective measures of performance on standardized tasks and (b) subjective records of observed behavior. One of the first things we will do during an approximately 8-week period of evaluation will be to determine whether our initial estimate of the vocational potential of the youngster is accurate. For this purpose we will use some of the evaluation tests developed by the use of work samples in the sheltered workshop rather than aptitude tests commercially available, which we have found to be inadequate for the mentally retarded.

There is general agreement that the attitude, social skills, and work habits of the mentally retarded are at least as important as their purely vocational skills in making an adjustment in the community. In order to observe and draw inferences from such behavior, paid work will be presented to the trainee in evaluation as early as the second week. He will be introduced to such concepts as inspection and quality control, relationship between his efforts, output, and earnings and the material value that the facility as well as our society places upon his labor. The trainees reaction to pay as an incentive will provide staff with some insight into his motivation and general readiness for a vocational goal.

The trainee will also be exposed to other activities in the areas of home-making, grooming, group activities, traveling alone, and his reactions recorded on the behavioral check list to measure, in addition to his abilities in these areas, his social relationships, reaction to peers and familiar and unfamiliar situations. (Appendix B—"Behavioral Check List" now in use that is being further refined and modified.) "The Behavioral Check List" is used both as a coarse diagnostic instrument and to measure change during the evaluation period.

At the end of the evaluation period, the staff will meet again to discuss the

data and set tentative goals for training.

Training.—After evaluation, the population will be divided into groups of approximately 15, by abilities, problems, and potentials. These groups will receive training in the following areas:

(a) Continued social development, including such areas as personal adjustment to the group and work situation, learning to travel alone, ability to sustain interest, the development of independence, and learning good work habits through the program.

(b) The development of skills to make the person a useful member of his household, such as homemaking, cooking, running errands, complete self-care, good grooming, shopping. Many detailed procedures have already been worked out for the sheltered workshop population that, with modification, can be adapted to this population appendix C).

(è) Learning a constructive use of leisure time through recreational group experience in the facility and in the community. This will include learning to participate in organized games, how to join a club, social dancing, crafts,

etc.

(d) An ongoing, structured program by the social worker, both individual and group, with the parents to nurture and develop constructive attitudes toward the retardates, their abilities, shortcomings, and future. Building again on the workshop experience with parents, the work essentially will be to establish a carryover from the program to the home as it affects family relationships, etc.

After an initial period of adjustment of the trainee, the social workers will administer a family evaluation index questionnaire, subsequently done annually, in order to test any change in the family index of adjustment while the retardate is in the facility. The Saenger study reveals that where there are families with a low index of family relations were considering institutionalization in 37 percent of the cases, only 4 percent were considering this where the index of family relations is high.

Staff will meet periodically during training to confirm or modify initial

goals.

E. RESULTS

 There will be periodic evaluations of the participants (retarded and families) to measure their growth on the scales we shall develop, as well as through subjective observations. We will observe, too, how many of the population served will be institutionalized, as against those on the waiting lists who receive little, if any, services.

2. We hope to get subjective evaluations from the institutions themselves, where there is institutionalization of any of the population to see whether these youngsters function any better than those of a similar level of development who

have not received the benefit of this facility.

3. We shall observe, too, how the degree of initial functioning, as revealed in our intake and evaluation, affects development of the retardate. We shall observe how progress of the retardate affects future plans of the parents for their children and their attitudes toward institutionalization. Is there carryover to the home? Are changes observed in program the same in household?

4. Such factors as motivation through pay incentives, previously discussed, group pressures through group meetings and clubs, attractive work, the age of the participant, how long the participant has been out of school, etc., will be used to see what effects these have on the personal growth and potential of the

trainee.

5. Another important area that we will explore and that may be the subject of some observations will be the retardate's attitude toward the family. All too frequently we speak only of the family's attitude toward the retardate. Our experience has shown that the retardate's attitude toward the family and himself may, in many instances, affect his behavior to such an extent that the decision to institutionalize or not institutionalize may depend on it. Query, Is his attitude merely a reflection on the family—or something different?

6. We shall analyze costs and the role of the individual staff members in relation to the program; evaluate the necessity of staff for other communities; the relation of transportation to the program; and make comparisons against instinction.

tutionalization costs.

7. We hope to summarize the results of this program periodically and at the end of the program, in such a form as to make available practical methods of training that we have tried and that have succeeded, to point out areas which have pitfalls to other agencies who may want to feel the need of such a program in other communities, in addition to institutions, who hopefully may set up such training programs themselves.

Our experience in a number of semirural areas in this State, indicate to us that such a facility on a regional basis may be a very good thing since any one small community may not have sufficient retardates to support this plan. In those cases, for example, the transportation will be an important element in the

success of the operation of the plan.

It is our belief that the program will be of great significance in many areas in the country to the development of services for the retarded.

2. Previous work done on this project

Since 1953 the applicant has operated a vocational training center and workshop for mentally retarded adults. Since 1955, this facility, serving about 95 a year has been partially supported by a grant the Office of Vocational Re-

habilitation. The grant expires in May 1960.

In this center, retarded adults are evaluated for their personal, social, and vocational potentials, personal adjustment, and vocational training are offered, and placement and sheltered employment follow. This was the first sheltered workshop for the mentally retarded in the United tSates. It has been chosen as the prototype for all such projects currently supported by OVR funds, and has served as a model here and abroad. It is visited annually by hundreds of students and workers in the field as well as community leaders seeking to set up a similar service. This service is a research program designed to discover the factors inhibiting the vocational rehabilitation of the mentally rearded, the place in the community of the sheltered workshop in overcoming these disabilities, and what other services are necessary to bring the retarded adult up to his full functioning potential.

The association also has a full recreation and group program for adults under a full-time director. These meet evenings under 18 group leaders and provide a vehicle to learn meaningful and more satisfying use of leisure time and social

growth.

In addition, the association's 11 classes serve the mentally retarded from 5 through 17 or older, who are not acceptable in special classes in New York City. These may be youngsters who function too low intellectually or have social or emotional problems making them ineligible for public-school placement.

In this service we see youngsters who will have no service in the community without a facility as here described. In the sheltered workshop and recreation programs, as well, these youngsters appear as adults, all pointing to something different than now being offered. Out of these experiences, as well as those of the special education department of the city of New York, the need for this program and proposal have been shaped. The negative as well as positive results in these programs has given us many leads for what should and possibly could be done.

As a result of these experiences, this association decided to set up an occupation day center and applied to the National Institute of Mental Health for a grant. Pending the decision on this application, however, the pressures for service were such, that the facility was begun on a very meager basis on the premises described previously. Since November of 1958, we have screened, in a preliminary way, about 125 prospective candidates for this service. We have accepted about 40 who attend the facility on a half-time basis, 3 days a week and 2 days the next. During this period, we have been exploring some of the areas of training that we feel will be necessary and some methods of accomplishing the training. The personnel has been limited for 4 months to one person in charge. Recently, we put another on staff as a training assistant. We have also been trying to develop a corps of volunteers, but have found this extremely difficult without adequate professional personnel to training them. During this time, much of the work of making the premises ready has been accomplished. We have experimented with types of equipment necessary. The bugs in transportation, which are quite numerous, have also been ironed out to a great extent.

Our limited experience in the facility itself up to the present time confirms what we have presented in our application, the necessity for more professional personnel. including a psychologist and social worker, and a carefully thought out structure for the program in terms of the result we are trying to obtain. We have also found what seems to be the optimum ratio of 1 training assistant to every 15 to 20 trainees. Even on this sketchy basis, there can be no doubt of the value of the program in terms of the happiness of the candidates and the

obvious relief of the parents in finding a place for their children.

The association's programs and their staffs, together with our staff in the central office, are prepared to contribute to the proposed program through cooperation and extension of services, beyond the doors of the facility in order to bring all community forces into play to develop these retarded adults and help

their parents.

To our knowledge, no similar program has been tried in quite this way anywhere else in the State. We have, however, found inquiry after inquiry, from the sheltered workshops now being partially financed by the Office of Vocational Rehabilitation throughout the country, concerning the retardate who needs something else than the sheltered workshop. We feel that a network of this type of facility, geared to the needs of the individual communities and in accordance with their financial resources, will supply this need.

Joseph T. Weingold is executive director of the Association for the Help of Retarded Children, Inc., New York State.

Rudolf P. Hormuth was assistant to Mr. Weingold and is now specialist in mental retardation with the children's bureau.

Eve R. Mayer was a social worker with the AHRC Training Center and Workshop.

Max Dubrow is director of the AHRC Training Center and Workshop. Jerome Nitzberg is the social worker at the training center and workshop.

Prof. Abraham Jacobs is associate professor of education at Teachers College.

3. Staff and biographical sketches

Staff, professional.—Director: M.A. or Ed. D. in education: Experience with mentally retarded children, preferably in an administrative capacity in a setting for "trainable children." Experience in experimental programs involving the late teenage or adult retardate.

Our initial selection is Mr. Arnold Fassler, as noted, but we reserve the right to be flexible in this matter. Other disciplines, such as psychology or social work may be equally competent, if they have had similar experience with

retarded adults.

Social worker: A senior psychologist, social worker—MSW minimum of 5 years' experience, preferably in child-guidance clinic or clinic for mentally re-

tarded. Experience in a setting working with other disciplines.

To see all families at intake, family history, to interpret goals of the services, to be available selectively to families showing either immediate need for continued case work or to families where family attitude would be an important factor in the adjustment of the group member.

After an initial period of adjustment of the client, to administer a family evaluation index questionnaire, subsequently to be done annually. To make referral, where indicated, to existing social agencies for other services.

Prepare significant material for referral for psychological examination.

Psychologist: M.A. or Ph. D. with significant clinical experience, especially with the mentally retarded. To administer a battery of psychological tests to all applicants; to reexamine all selected applicants semiannually.

To observe program and recommend individual suggestions for group members

on the basis of text experiences.

In very selected instances to be available for individual handling of behavior to assist in adjustment to a group setting.

To help set goals for training on the basis of test results, indicating areas of

capability.

Supervisor of training: We are considering individuals with three different types of training and would like to experiment with this position. (a) A person with educational background in the field of mental retardation

and industrial arts training.

(b) A person with a master in social-group work.

(c) An O.T. with broad orientation in the field of the handicapped, and willing to work without medical supervision.

Perhaps more important than the kind of training is, as mentioned before, the personal characteristics of the individual selected.

Training assistants: This is a key job in the program.

Warm, understanding, accepting person, related to using himself or herself in a variety of new and different ways. Previous experience may be in special education, community center work, industrial arts with retarded would have obvious applicability.

B.A. or B.S. evidence of educational background, but not essential.

Under direction of director or assistant.

Assume responsibility of groups of 15 to 20 in a structured program,

Conduct training related to travel, homemaking, personal and interpersonal behavior, and educational material.

Supervise use of leisure-time activities, developing under direction, such

activities more appropriate to chronological age.

Develop atmosphere of appropriate adult behavior through use of program media. Supervise activities outside the center, such as shopping, going to movies, use of travel facilities, use of other agency recreational facilities. going to the barber, beauty parlor, etc.

Mr. Elliott. Mr. Barden has some questions of you, Mr. Weingold. Chairman Barden. Mr. Weingold, I want to mention this: You are dealing with a subject that is very popular in the U.S. Congress. I doubt very seriously if there are any of the Members here today but what are in favor of that program.

The trouble we confront is "What program?" It is something that

appeals to the emotions and the good sense.

As far as I am concerned, I have been fanatically in favor of vocational rehabilitation, and those things that are akin to those programs, but we know we are short on teachers. We know that we are short on teachers of teachers, and we know we have a world of conflicting information on what kind of program is the best program.

It results in compounding confusion. We get letters and they love to use the term "I am president of such and such organization, and I represent a million members." Then you open the fifth letter and you find out that he represents a million members, and has even an

entirely different program.

We are not experts. There may be some in Congress, though I do not often run into them. When I do, they are very troublesome.

But you have a lot of organizations. It has an appeal. I think before we ever come out with a reasonable, practical, workable answer that will come up with results, you fellows must get your heads to-gether. We are not going to be very successful as referees as to who has the best idea.

We would like to be in the possession of where is the best program. I make that statement very seriously. I did not start in this trouble yesterday. I have been in it for 25 years. I drop that hint. It is good sense. It is good business. It is wonderful to take one off the expense list and put him on the tax list. Well, if we keep on spending money it will be about as uncomfortable to be on the tax list as it is

on the other one. We have to be aware of that.

We, of course, want the States to accept the responsibility they can. The Federal Government cannot carry it all. It certainly should do. a lot of work, but there is a general opinion that the Federal Government takes the whole works; though when it does, the tax bill will be around to see our children. Somebody is going to pay for it, that

is all, if our Government continues.

I would not like for my grandchildren to be brought up and talk like the little girl who went with her mother to the grocery store and the mother selected her groceries, but then she went by the cash register to pay the bill, the little tot being along with her, and when she paid the corner grocerman the bill he wanted to be nice to the little girl as it was good business, so he took a piece of candy and handed it to her.

The mother said, "Now, Honey, what are you going to say?"

She said, "Charge it, please."

Let's not train them that way. I think that is bad vocational

training.

I would like to urge, though, please, to you folks who have given a lot of time, who have become experts, who are recognized as such, that there is very little attitude and very much reluctance, I find, of experts in these fields wanting to give an inch. They are a little bit maybe like myself.

When I conscientiously believe I am right, I am just as right as if I was right. In the interest of getting something done, do not load the whole thing on Chairman Elliott and the rest of these gentlemen

to referee and try to get the popular slant on it.

We want the practical slant. I say that.

I mentioned a while ago that the first legislation in the field of the blind, they did a grand job, and they made it possible for the kind of basic legislation to start.

So please help us. That is my plea.

Mr. Chairman, I apologize for taking the time.

Mr. Elliott. Thank you, Mr. Barden, and thank you, Mr. Weingold.

Mr. Weingold. Thank you.

Mr. Elliott. I now recognize the gentleman from New York, the ranking minority member of this subcommittee, to present our next witness.

Mr. WAINWRIGHT. Thank you, Mr. Chairman.

In line with Mr. Barden's suggestion, the little child who suggested "Charge it," when given the piece of candy, there is an organization on Long Island known as Skills Unlimited, and fundamentally the philosophy of this organization is to take the physically handicapped and put them to work in industry so they earn their own way just as the rest of us try to do.

Representing that group today, and who will tell us about it, is

Mrs. David Weld.

Mrs. Weld, would you present yourself to the committee?

STATEMENT OF MRS. DAVID WELD, SKILLS, UNLIMITED

Mrs. Weld. I certainly don't represent a million members. In fact, our workshop is very small, and the only way it would have any significance for you, I think, is if you could argue from the particular to the general.

It is a vocational rehabilitation workshop. We feel physical and emotion rehabilitation is done by other agencies in the county, but when a client is ready to go to work, we are the only outlet in Suf-

folk County to whom they can come.

From the beginning, the board realized that Skills was too small an outfit to take care of the rehabilitation needs of everyone in Suf-

folk County, so we limited our field to the physically disabled.

We planned to take only physically handicapped candidates, but, in spite of that determination, we have had to change our policy in order to maintain maximum service to the community.

I might say that this workshop was started originally by the Council of Social Agencies in Suffolk County, so the motivation was quite

pure

In or near Suffolk there are some outlets for the simple physically disabled who need a minimum of vocational training. They can be placed directly into business or industry by the DVR or the SS.

They may develop self-employment or even travel to a nearby industrial workshop where as there are no outlets in Suffolk for the so-called unemployables, the severely disabled, postpsychotic or the mentally retarded except at our workshop, Skills, Unlimited.

In a period of about 4 years, 40 percent of our clients have had emotional or intellectual disability. The local DVR, unofficially, says that only 50 percent of the people referred to them nowadays have emotional or retarded disability, whereas the people we get from the DVR are more than 75 percent emotionally retarded.

We think that is because we are the only facility for that group.

We have had 169 clients go through the shop, and 33.7 percent of these, which is more than a third, have become employed or found jobs outside of Skills, Unlimited, as a direct result of their training with us.

Of course, we still have a great many of them with us because we feel that there is still a chance that we may be able to place them outside if they get a little more experience.

We consider this a successful operation.

The reason I am telling you about it is that it simply couldn't have existed without DVR funds. Almost every one of our clients is referred through DVR.

A few of them through voluntary agencies who support them to a

certain extent.

We have had a grant from the State DVR for expansion, but Skills, Unlimited, just could never have come into being without DVR money.

Our first recommendation to the committee would be to continue the DVR and OVR funds and their availability to small outfits like us for rehabilitation, vocational rehabilitation.

Our next recommendation is less specific and grows out of a problem

which we meet constantly at the workshop.

The young people who come to us for training, and we have a large percentage of young people who come, either straight from high school or are about that age and have never had much education or have never been employed, most of them have spent many years in special classes, but we find that they are simply not educated up to their capacity. This is particularly true of the retarded group. Even the educable retardates with an IQ of over 50 have not been taught to count or to tell time or to make change.

We know that these skills can be taught, and they are absolutely essential for us before we can start a client learning a vocational apti-

tude.

Apparently, the school districts cannot raise funds for capable teachers or provide adequate space for this kind of group.

I find all different chronological ages together and that develops

emotional problems.

Skills, Unlimited, is very conscious of this need.

Funds available for improved education of the young handicapped, particularly retarded, would very much improve their chances of subsequent vocational training and self-sufficiency.

That is our second recommendation.

I could not resist putting this in. Although it has nothing to do with the allocation of funds for you, one field in which we could use help and all workshops like us could, is that we have trouble getting suitable contract work for handicapped workers. We are not looking for handouts.

It is obvious that a workshop does have to maintain the highest quality production to exist at all. But we thought perhaps if the Small Business Administration had their attention called to the fact that small workshops for the disabled needed contracts, something

might be done at a Federal level in that way.

I have a detailed report of 150 cases made out by our executive secretary, but I have summarized that more or less.

I might leave it with you.

Mr. Elliott. The Chair recognizes the gentleman from North Carolina

Chairman Barden. Mr. Chairman, could that be placed in the record?

Mr. Elliott. Would you place the detailed analysis of 150 cases that you mentioned into the record as part of your testimony?

Mrs. Weld. Yes, sir.

(The list referred to follows:)

ANALYSIS BY MRS. RITA ZIELENSKI, EXECUTIVE DIRECTOR, SKILLS, UNLIMITED, INC.

The following is a brief analysis of 150 cases of handicapped persons given training and employment by Skills Unlimited, a vocational rehabilitation workshop in East Islip, Long Island. Although no complete, scholarly study of these clients has been attempted, there are certain facts and conclusions which emerge very clearly.

The incidence of various disabilities found among the 150 clients is as follows:

220 12010100000000000000000000000000000	
Mentally retarded	
Emotionally disturbed	17
Mentally retarded and emotionally disturbed	
Mentally retarded and physically disabled	15
Emotionally disturbed and physically disabled	7
-	
Total	63
Physically disabled	87
_	

150

Thus it can be seen that in a shop originally intended to serve the physically handicapped only, 42 percent over a 4-year period were handicapped by a mental or emotional disability. This proportion represents diagnosed cases; there were many clients referred to Skills Unlimited as strictly physically disabled clients; experience in the workshop later revealed an emotional or intellectual disability. Although Skills Unlimited started out to serve the physically disabled, the demands to offer service to this 42 percent (and more) were so great that we tried to meet the need with specially devised programs where possible. The Hempstead office of the State division of vocational rehabilitation unofficially states that 50 percent of its present caseload is comprised of the postpsychotic and the retarded. At the same time it is significant to note that 75 percent of the referrals to Skills Unlimited from the DVR are clients with these disabilities.

Of the 63 clients who suffered from these mental disabilities, 31 were over 21 years of age and 32 were under 21. None of the group under 21 had finished high school and most had not finished elementary school. Among the 87 physically disabled clients, 15 were under 21 and none had finished high school.

Of course the significance of this experience with these 150 clients lies not in the figures but in the results. It is the consensus among the workshop staff and also the referring agencies that all of the emotionally disabled were helped to some degree; several found jobs on the outside, some sought much-needed hospitalization or special therapy; all left the shop with new courage to travel, seek better jobs or just to change the environment in which the condition originated. On the other hand it is the consensus of the workshop staff that the results with the retarded were not as favorable. The reason in every case was because the retardates come to us with little or no preparation for even the simplest kind of vocational training. None of them could read or write other than their own names; none could count to 100 accurately and very few could count at all. None could tell time, make change, weigh or measure. These count at all. None could tell time, make change, weigh or measure. were educable clients who could reasonably be expected to have mastered some limited level of competence in these areas. In addition, all were so distractible as to be unable to learn in a group situation. In addition we found that all of these young retardates had been in ungraded special classes, some in groups including children from the ages of 10 to 17. There were, of course, emotional

conditions resulting from this procedure of grouping retardates of all ages in

one special class.

As for the young people who had only physical handicaps their schooling varied widely but in every case would seem inadequate. Some had classes during their stay of from 5 to 10 years in a hospital; some had received home tutoring from time to time; those who were ambulatory attended regular classes up to eighth grade. There seem to be little or no high-school facilities available at the schools for nonambulatory pupils.

The recommendations we draw from the foregoing experiences are as follows:

(1) Funds should be made available for more workshop facilities for the post-psychotic. There are several ways in which this could be done: expanding present workshop facilities; adding workshops to the present mental-hospital programs; providing funds so that new workshops can be established. In order to contribute some new knowledge to this aspect of rehabilitation Skills Unlimited has applied to the Office of Vocational Rehabilitation for funds to do a 5-year research study on the benefits of establishing a workshop in a convalescent home for emotionally disturbed veterans.

(2) Funds should be made available for more special teachers, for additional classroom space and other facilities for educable retardates. If the retardates in this group could be taught the basic skills already mentioned here, within their own limitations, they would have much greater hope than they have now of being trained to become self-supporting in whole or in part. A rehabilitation workshop cannot train retardates to count, write, tell time, etc., and still train him for a job. The preparation must be in the schools which today are not ade-

quately staffed or equipped to do this job thoroughly.

Mr. Elliott. Thank you very much, Mrs. Weld. Your testimony was very helpful to the committee.

Mrs. Weld. Yes, sir.

Mr. Elliott. Our next witness is Miss Joan Abajo, teacher at the Lexington School for the Deaf.

Miss Abajo, we are very happy to have you here.

STATEMENT OF JOAN ABAJO, STUDENT, LEXINGTON SCHOOL FOR THE DEAF

Miss Abajo. Mr. Chairman, members of the committee, I greatly appreciate the opportunity to speak to you with regard to the pressing need for the legislation presented in Resolution 494.

Most of the testimony we have heard thus far concerning the training of teachers for the deaf has been presented from an administrative

point of view.

I speak to you as a teacher in training. Why have I chosen this field? This work is challenging, offers enormous inner satisfaction, opportunity to contribute to the growth and development of other human beings, but most important, is the reward, the reward of watching children born into a silent world learn to communicate, not perfectly, but effectively, in a hearing world.

Why, then, are there so few teachers available in this exciting field? Is it the year of graduate work that is necessary to become specially

trained?

I think not. But it is the money it costs to become specially trained. I have worked for the past 2½ years as office manager at Mademoiselle magazine trying to save enough to take a year of double loss. Yes, a double loss for during the year in training we have no income and yet

at the same time we are paying out.

Some of us go into this graduate work directly from college. Many of us are willing to obligate ourselves with loans which will take a

number of years to repay; many of us are willing to accept grants and scholarships from local organizations which require our services in their schools for a number of years.

Yet, because the number of schools that have training programs is so limited and the number of trainees those schools are able to accept each year is even more limited, we consider this year a real privilege.

Lexington School, the originator of the language method, has had a training program since 1906, and in more than half a century has graduated only some 400 teachers. There are only 12 in this year's class.

With more space and housing facilities our school alone could train

three or four times our number.

The actual cost of this year is \$2,400 per student, at a minimum. Tuition costs \$1,400, not including books and necessary materials.

The cost of room and board at Lexington School is \$1,000. Where

else in New York City could one live on that small amount?

Our class represents 11 States, some girls coming from as far away as California, Colorado, Utah, and the State of Washington, thus,

there are heavy travel expenses.

Believe me, we aren't complaining for 1 minute. We are so very grateful and mindful that every available advantage is being offered us. We do regret that many times our number can't have these same advantages.

Indeed, we are flattered with the deluge of letters from all over the country offering us employment, but, at the same time, we are depressed by the realization that there just aren't enough trained people

to fill a fraction of these jobs.

It is the administrators and teachers themselves who work laboriously training us, in addition, of course, to their own responsibilities.

There is no existing personnel.

Naturally, with the increase in young men and women able to be trained—assuming this bill is passed—there will come the need for personnel. Perhaps some of us will be among those who will go even one step further and become administrators of training programs.

While you gentlemen tour this country, holding hearings, may we hope that you take time out to visit as many schools for the deaf as you can, see this progress being made, the strides taken by these children, for I believe that this firsthand observation will enable you to evaluate more accurately the gravity of the situation.

I would like to extend to you an invitation to visit Lexington School

while you are in New York City.

Deafness is not a visible handicap. Most of us originally thought of deaf and dumb as being synonymous. These children are not dumb. They are of average intelligence, often extremey bright children, but are unable to communicate their thoughts and ideas without special help. With this help they have the chance of becoming first-class citizens, leading healthy, relatively normal lives in a world full of sound that they will never hear.

They become gainfully employed, have happy homes and marriages.

I do hope you come to Lexington and see for yourselves.

Thank you.

Mr. Elliott. Thank you very much, Miss Abajo.

Are there any questions?

If not, your testimony will be very helpful and we appreciate it a great deal.

Has Mr. Lee C. Dowling arrived yet?

Has Dr. J. M. Brady arrived? Has Dr. Marion Langer arrived?

Is Mr. Jack Rothman, president of the Council for Exceptional Children, Cerebral Palsy School, Roosevelt, N.Y., present?

Mr. Rothman, would you testify now.

STATEMENT OF JACK ROTHMAN, PRESIDENT, COUNCIL FOR EXCEPTIONAL CHILDREN, ROOSEVELT, N.Y.; ACCOMPANIED BY EMIL A. LOMBARDI, PRINCIPAL, CEREBRAL PALSY SCHOOL, NEW YORK, N.Y.

Mr. Elliott. Mr. Rothman, we appreciate your willingness to go on a bit ahead of time. We understand that you are president of the Council for Exceptional Children, Roosevelt, N.Y.

Would you introduce for the record the gentleman who accom-

panies you?

Mr. ROTHMAN. This is Mr. Emil Lombardi, principal of the Cerebral Palsy School at Roosevelt, and the past president of the Council for Exceptional Children at Roosevelt.

Mr. Elliott. You may proceed.

Mr. ROTHMAN. We have been discussing this since we received your gracious invitation to attend and, of course, you probably will hear a lot of some things we have in mind from some other people.

But what we were particularly interested in is the expansion of

public services to accept all types of handicapped.

We are particularly concerned with the handicapped who leave the schools at the age of, say, 18, but have no place to go. In other words, we give them as good an education as we possibly can, but they just don't fit into our economy.

They really should not be institutionalized and they really can't

work.

What happens to these people after we have given them an education, spent a great deal of money on them?

What happens to them? Do they stay at home?

We feel there should be a midway, a half-way facility, where the child, or, if it is a grown up, can attend a school where he will be exposed to social and vocational experiences in a limited way, so that we can carry on some of the work that we have done and have not succeeded in doing in a regular public school, which means that these children, these teenagers by now, would not have to go into public institutions, would not become public charges, and could stay at home, because in most cases the parents would be able to put up with the child if the child were away from home, say, 4 to 6 hours.

But we have to give them meaningful experiences in this area so that possibly, and these are all suggestions, of course, the school can be run, say, by an educator with the facilities of a psychologist, of a social worker, of a medical doctor, a vocational rehabilitator with a

team approach.

Perhaps the child needs another 2 years of schooling, and by then he might be able to get some sort of a vocational job.

But where the responsibility drops off at 18 or 19 without anything

else, would mix it up.

The child has been in school and has been worked with and everything else, and all of a sudden there is a sharp drop. All of a sudden he is put out.

What happens to him? Where is the planning? There should

be some type of planning that goes on beyond this.

But it should be a realistic planning, a planning that is open to all types of handicapped children and not where you have to have certain restrictions and so on because of your handicap, but where a child can go, so that we don't have to place a child in an institution.

So that we can utilize him.

It has to be a public type of thing, which is available to all handi-

Mr. Lombardi. Mr. Elliott, if I may add or go a little further on what Mr. Rothman has indicated, although we are aware, as he mentioned, that others may come in here and have similar ideas, we want to support anyone who possibly had a similar factor concerning what

we call a midschool.

We were in hopes if any grant might possible be provided on the Federal basis for this type of midschool, as Mr. Rothman explained before, and I would like to go a step further, we have a group of handicapped individuals within all our communities, and in some communities more so than others, and these people are not qualified for homebound training, do not qualify for hospitalization type of programing, nor do they belong in a school.

Most times they are considered for residential institutional care.

It is a feeling that there is a possibility with this midschool that we can overcome this problem of sending them to institutions and to do what we can in a very limited way, through this midtype school, whether it be a recreational plan or medical plan, we are not certain unless some type of grant were given to service the needs and the qualifications that necessarily have to be taken into consideration for such a plan.

This is the only thing that we would like to offer from our particular

chapter.

Mr. Elliott. Thank you very much, gentlemen. Your testimony will be very helpful to the subcommittee. We appreciate it very much.

Mr. ROTHMAN. Thank you very much for having us. Mr. Elliott. Has Mr. Lee C. Dowling, Director of the Joint Legislative Committee on Mental Retardation arrived yet?

Has Dr. J. Morrison Brady arrived yet?

Dr. Marion Langer ?

Mr. Richard T. Gilmartin?

We have heard about 15 witnesses, so we will recess now until 1:30. (Thereupon, at 12:05 p.m., the subcommittee was recessed, to reconvene at 1:30 p.m. same day.)

AFTER RECESS

(The subcommittee reconvened at 1:30 p.m., Hon. Carl Elliott (chairman of the subcommittee) presiding.) Mr. Elliott. The subcommittee will be in order.

May I say that we have about 15 witnesses to hear this afternoon, and we want to try to complete this series of hearings this afternoon, if possible, so it will be necessary that we again limit, as best we can,

the time taken by each witness.

Also may I say that the subcommittee is extremely happy to have with it this afternoon the gentleman from New York, Mr. Ludwig Teller, who is a Member of the U.S. House of Representatives, representing the 20th District of New York. Mr. Teller is interested, I might say he is vitally interested, in the subject matter of the hearings before our subcommittee. He is the author of bills on this subject.

We are happy to have you, Mr. Teller. I wonder if I might recognize you at this time to say a word in behalf of your views on this

matter?

STATEMENT OF HON. LUDWIG TELLER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK

Mr. Teller. Thank you, Mr. Elliott. I am delighted to be here. As you have pointed out, I do have at least two bills on this subject, that is to say, Federal aid for emotionally disturbed or mentally ill

children.

I think that at the present time our Federal statutory intervention in this field can stand improvement. The statutes in the main seem to deal primarily with the retarded children, and the Federal Government does a job in that field, a job which could be expanded and refined, but at least there is a measure of Federal intervention in that field.

When it comes to the emotionally disturbed or the mentally ill child, the Federal Government lacks vision, and it has failed to take the kind of intervention which is so desperately necessary in this field, particularly because by the expenditure of a small amount of money,

a tremendous measure of rehabilitation can take place.

In the case of the mentally retarded child, the prospects for rehabilitation are meager, but society can get tremendous gains from young, gifted children who are emotionally disturbed or mentally ill. So it is my hope that as a result of these hearings we will be able to spotlight the need for Federal intervention, not merely by the spending of money, but for purposeful outlay, by providing funds for the training of teachers in this very important field, and for the development of programs for the mentally ill or the emotionally disturbed child.

These hearings are very significant, particularly if they develop a better understanding of this gap in the Federal intervention in this field. I congratulate the subcommittee on its work.

Mr. Elliott. Thank you very much, Mr. Teller.

Chairman BARDEN. Mr. Chairman—

Mr. Elliott. Mr. Barden.

Chairman Barden. My friend has made such a nice statement that I hasten to claim him. He is a member of the full committee on this subject, of which this is the subcommittee.

Mr. Teller. I am delighted to see that the chairman, who has had such a tremendous job of work in the last session, has nevertheless

found time to come here and to be here. We are honored by his being the chairman of our distinguished committee.

Mr. Elliott. Thank you very much.

Our next witness is Dr. Marion Langer. Is Dr. Langer here?

Please come forward, Dr. Langer.

Dr. Langer represents the American Orthopsychiatric Association. We are happy to hear you, Dr. Langer. If you could, confine your testimony to about 10 minutes. It will be very helpful.

STATEMENT OF DR. MARION LANGER, EXECUTIVE SECRETARY, AMERICAN ORTHOPSYCHIATRIC ASSOCIATION

Dr. LANGER. I am all prepared.

Mr. Chairman and gentlemen, the American Orthopsychiatric Association is pleased to respond to the request of your committee and to give its opinion on some of the problems of special education and rehabilitation. The American Orthopsychiatric Association is concerned with the mental well-being of the individual at all ages, but chose to limit its consideration in this statement to children for two reasons: (a) it assumed that many other organizations in the field would present data with respect to special education and rehabilitation programs for adults; and (b) basic to the entire problem are the preventive aspects of such programs and this necessitates primary consideration of the needs of the handicapped child.

The American Orthopsychiatric Association has a membership of more than 1,600 psychiatrists, social workers, psychologists, and other professional persons including educators, sociologists, et cetera, whose work and interests lie in the study of personality and behavior and the

treatment of disorders thereof.

Membership is limited to those whose activities promise an enhancement of the association's scientific objectives and whose qualifications meet those set by the association. We unite and provide a common meeting ground for those engaged in the study and treatment of problems of human behavior; we spread information concerning scientific work in the field of human behavior, including all forms of abnormal behavior.

We are listed as an educational and scientific society. It is from

that standpoint that we speak.

THE BACKGROUND OF THE PROBLEM

(1) The extent of emotional and mental illness and its problems are of great significance to all of us. According to present indications, 1 out of 12 babies born in this century will enter a mental hospital. It is estimated that there are between 9 and 13 million people with nervous, mental, or emotional troubles. It is generally accepted that the factors influencing breakdown and that become apparent in the emotional ills of adults begin in childhood.

(2) Estimates as to extent vary, but most authorities believe that the incidence of mental retardation is about 2 percent of the general

population.

(3) Mental retardation is a condition which results from a combination of biological and environmental factors. There are literally

dozens of different medical conditions which can cause mental retardation. All types of mental retardation are further influenced by social,

economic, educational, and emotional factors.

Despite the relative inability of medical science to cure mental retardation resulting from cerebral defect, authorities agree that most retarded children can become useful, productive individuals if they are given suitable education and training, and are accorded the same degree of social acceptance as other children with different types of disabilities. For example, only a very small proportion of even the severely brain-damaged children are not capable of learning self-care.

(4) It has been believed for too long that the provision of State training schools or some few special classes in the public schools solves the problem of all mentally retarded children. Actually, a relatively small proportion of all mentally retarded children require costly in-

stitutional care.

Yet in the absence of special facilities in the community such as special clinics, adequate school and recreational services, guidance and counseling, vocational training and job placement, many mentally retarded children are never trained to utilize their hitherto overlooked capacities for productive living and potential contribution to society.

(5) We have paid for our neglect of these children not only by having to maintain and to support large and costly institutions for their permanent care, but also through the loss to the community of

these individuals' potential social contribution.

(6) Most mentally retarded children can become valuable assets in their homes and in the community if they are given the proper help and training. It is obvious that the rehabilitation of the retarded child is a many-sided venture cutting across the lines of responsibility of many disciplines—medicine, education, psychology, and social work.

Clearly, this is an area in which the community itself must begin to see its responsibility beyond the maintenance of some special classes and residential institutions. In this way, the 75 percent of the retarded group who, according to former Surgeon General Scheele, are capable of being rehabilitated, will become productive, contributing members of the community.

Whatever the legal or social designation, whatever the clinical diagnosis, the emotionally disturbed child can be described in the

following terms:

They are children who are frightened, fearful of human experience; children who have not had opportunity to discover the gratification of positive accomplishments necessary to their healthy growth. They may be impulsive, unable to tolerate anxiety, frustration, or competition, and may react with withdrawal, or aggression, or other defensive measures to protect them from their feelings of inadequacy and insecurity.

They may be anxiety-ridden children who have never known the security of consistent living with people and control of their behavior. They are children who have experienced too little love or too much neglectful indulgence. Many come from homes not broken by poverty essentially, but more often by situations in which parents, either because of problems or other difficulties, are unable to cope with the demands of parenthood. Often the sheer weight of the child's problems.

lem and lack of adequate resources to help renders the parents unable

to cope with the child.

Many of these children have had brain damage, many have had little stability or continuity in their significant relationships with people, or they have been brought up by parents too upset themselves to permit normal identifications to develop; or they may have had a combination of both.

In the treatment and education of these children, they must be exposed to a variety of experiences with children and adults; to constructive experiences and activities in which there can be accomplishment and a sense of gratification; in which they can have the feeling of being wanted, respected as individuals, and loved; in which there can be routine and framework and the kind of consistent regime or controls they so desperately need.

THE NATURE OF THE PROBLEM

The retarded and mentally ill cannot be treated as a homogenous group, nor can recommendations of a general nature be safely made. Each child must be treated as an individual with all his possibilities. There is much we do not know about these children. It is often difficult to distinguish between a retarded and a mentally ill child. Many errors can be made in diagnosis to the detriment of the child and society. Also, retarded children, even brain-damaged children, have an emotional life. Often emotional disturbance of all degrees is superimposed on retardation and not recognized. Two points are basic:

(1) In any community approach, it is first necessary to determine the size of the problems already known, to identify, diagnose, and

classify them.

(2) To differentiate these problems according to two main groups: those who are seriously ill, need and can use a community-based clinical service, and those who may or may not be diagnosed as seriously disturbed, but who can and should be served by a variety of other professional and supportive services.

Placing a damaged child in a setting where he has opportunity for normal growth experiences is in itself a form of treatment. Real experience and real relationships come out of the process of daily living as it may be planned and directed in accordance with the thera-

peutic needs of the child.

There has been too little willingness to try with these children to experiment with different methods of care. It has been more characteristic for agencies and schools in the face of limited resources and many pressures to treat them routinely. Following are some of the

present understandings generally accepted:

(1) Presently available estimates of the number and types of children needing various forms of care and treatment are inadequate; no sound estimate of the incidence or prevalence of particularly psychiatric disclosures requiring such treatment can be made. However, it is known that the problem is massive and will grow with the population growth.

(2) There are at present no statistically valid data on the number of emotionally ill or mentally retarded children needing institutional treatment; criteria for the judgment of the need for institutional

treatment against other forms of therapy are not established; the effectiveness of all forms of treatment of the mentally retarded has not been validated.

(3) It is known that seriously emotionally ill children are being kept in detention homes, jails, and other inappropriate places; and that mentally retarded children are frequently misplaced.

(4) Not enough professional, technical, and related personnel are being trained. We are not deploying and utilizing existing personnel most efficiently. Not enough sound opportunities are available within which new methods of training and utilization can be tried.

(5) The existing services and agencies represent an unplanned and uncoordinated patchwork. There is no major force available to act

as a catalyst toward coordination and planning.

CONCLUSIONS

(1) There is as yet no satisfactory definition or classification of the basic community problems to which a community mental health program strategically should be directed. This is the reason that so far we have no usable epidemiological data about the communitywide size and characteristics of mental health problems. The only reasonably clear segment of the problem about which we have data is in the mental hospital field. Here we have many facts about people who are severely ill and disturbed.

(2) Lacking a concept of a program with a communitywide problem focus, we have no basis for evaluating the impact of mental health services upon the community's problems. Among evaluation studies of community mental health services, it might be noted that there is a general lack of research within any of the behavioral sciences specifically directed to communitywide results, a lack of administrative and

planning research with an accompanying action program.

(3) The nature of what constitutes a mental health program is made even more ambiguous and confusing by the fact that under many different behavioral disciplines there are an equal number of claims to comprehensive community goals.

The basic services, public and private, which we have created, their traditional and uncoordinated community design, represents a formi-

dable handicap to a unified attack on the problems involved.

None of our present services is organized to produce comprehensive

diagnosis and treatment.

Under existing pressures and lack of existing services children are often buffeted from one service to another. Children who might be kept at home or in a community institution are in all too many instances placed ultimately in long-term institutional care possibly because the agency to which they are known, usually by inadvertence, did not have available a complete service.

No completely coordinated use of our existing knowledge will be achieved until we establish better unification of patterns of service. Greater precision is needed if we are to (a) meet the problems; (b) achieve desirable therapeutic goals on a communitywide basis; and

(c) to use mental health resources effectively in the directions of greatest need.

Emphasis must be placed on (a) early diagnosis and treatment; (b) making all services available on a coordinated basis to the children and families who show severe pathology.

It is suggested that four modes of basic services are needed:

(1) An in-patient psychiatric service for (a) those who can be treated and returned early to community life; (b) those too ill or not amenable to short-term, in-patient care.

(2) An all-purpose mental health service to identify, diagnose, and

treat disturbances needing treatment on an out-patient basis.

(3) A multipurpose professional service for families and children to meet the problems of adjustment and offering casework, group work,

child placement, day care, and related services.

(4) Special educational services available to each school system. Classes should be manned by specially trained teachers; clinical personnel should be available to help. Program should be prescriptive and coordinated with other services indicated above.

Aside from the hazards of existing traditions, which prevent coordination, a great bar to ultimate achievement of a sound pattern in any community is the absence of proper educational facilities in ade-

quate number for the children under treatment.

The in-patient facilities generally have special educational programs. However, many children who might otherwise be kept at home or in open institutions are sent to in-patient facilities. public schools have developed educational facilities for retarded children but for the most part not for emotionally disturbed children.

Children who might live at home and receive clinic or private treatment are often placed in foster homes, then open institutions, then in closed institutions. Recently, in a few States some day-care programs for the disturbed child have been initiated. If a total day of care away from the parent could be planned in conjunction with the proper therapies as part of most community programs, the child might have been able to live in the community and to be treated more economically from many standpoints.

Very little is known, because there has been a dearth of experimenta-

tion about educational programs for these children.

H.R. 3465

(1) The great interest and concern for the disabled by public and private welfare agencies, public health programs, medical programs, and vocational rehabilitation programs has resulted in a complex system of public and private programs frequently overlapping with

respect to clinical services and professional personnel used.

(2) The several programs have had different financing bases, some of which has impeded development of high quality services. instance, the 1956 amendments to the Social Security Act gave recognition to the need for the importance of services to public assistance recipients that provided less Federal matching than other similar programs.

(3) Each system developed social, psychiatric, and psychological concerns which bind them together, but they have not yet found the proper ways and means of coping with institutional patterns, tending

to deprive people of a free flow and full range of integrated and unified services.

RECOMMENDATIONS

(1) Therefore, we recommend that all existing programs at the Federal level, including vocational rehabilitation, social security, and public health, be allowed to continue and develop their programs but that no one of these agencies be given a new responsibility such as described in H.R. 3465. Rather, we propose that new legislation be developed with authorization and funds given directly to the Secretary of Health, Education, and Welfare to unify the type of demonstration designed to coordinate the several programs now suffering from proliferations caused by legal problems on the one hand, and by the large number of specialized agencies devoted to a particular handicap, on the other.

We propose that the Secretary be provided with proper advisory and interagency machinery designed to not only improve present programs, but which might have the potential for unifying and coordinating our preventive and therapeutic resources. This would be a step toward consolidating our gains and arriving at better methods to pinpoint the nature of problems and to attack them with integrated force, rather than with present uncoordinated forces and broadsides.

Because there is so much unclarity as to the nature and meaning of "rehabilitation" and because the several programs all have engaged in "rehabilitation," assigning the function of "rehabilitation for independent living" to one agency might tend to confuse rather than clarify; to scatter further the already scarce resources and to increase the hindering jurisdictional difficulties.

(2) That the Congress, together with the Department of Health, Education, and Welfare, using appropriate councils and studies, including those of this committee, move in the following directions by

appropriation and program:

(a) A massive approach to the recruitment and training of professional personnel in the child rearing and treatment fields. These include psychiatrists, special education teachers, social workers, psychologists, and a variety of other personnel utilized in institutional treatment and preventive programs.

(b) Aside from basic research, to encourage operational research and experimentation designed to eliminate outmoded and overlapping structures at local operating levels, so that dollars and personnel existing at any one time can be used with maximum efficiency.

(c) Increase Federal concern, not only with basic research, but em-

phasize research on methods and machinery for prevention.

We are very appreciative for the opportunity to have presented our point of view and we are certain that the members of our association, in their several capacities, will be happy to assist the committee or the Federal Government agencies in any way. The association will be glad to receive requests for advice or assistance and transmit such requests to its members.

Mr. Elliott. Thank you very much, Dr. Langer.

If there are no questions, our next witness is Miss Arlene Gilbert, field consultant of the State Charities Aid Association.

STATEMENT OF MISS ARLENE GILBERT, FIELD CONSULTANT, STATE CHARITIES AID ASSOCIATION

Miss Gilbert. You sort of saved me, Mr. Elliott, my first sentence, but I think I should say that although I am here in my capacity as field consultant of the State Charities Aid Association committees on children and public welfare, I represent Mrs. George Govern, of

Seneca Falls, N.Y., president of our State committee.

As these hearings have been called to discuss needs in the field of special education, it seems in order to include a discussion of special education which can prevent handicaps as well as that which offers rehabilitation. The handicaps we refer to here are social rather than physical. The group of children we refer to are perhaps the most severely handicapped in the United States as far as education is concerned, children of migrant workers. The schooling of these children is so interrupted by the constant movements of their families that it is almost impossible to compare their education with that which we expect as a bare minimum for our children today.

It appears to be assumed that they can pick up where they left off at each move, enter a new school at their grade level, and reweave the dropped threads into a fabric which can be stretched to meet specifications. Yet we know this does not work. Records indicate that relatively few migrant children attend school regularly. Studies have shown that most of these children are far below grade level and that their school achievement generally is under fourth grade, the attainment established as a minimum standard for literacy in the United

States

It is reported by the U.S. Office of Education that the migrant group has the lowest educational attainment of any group in our Nation. It has been shown that there is no inherent defect in the abilities of these children, that even IQ ratings improve with better schooling. Many factors add up to a deprivation for children of agricultural migrants of educational privileges equal to those of other children. As a result of these factors, children of migrants enter school later, attend fewer days, show greatest retardation, achieve the least progress, drop out of school earliest, and constitute the largest single reservoir of illiterates.

Some of these factors are deeply personal—lack of interest of parents in the education of their children, needed extra income children may earn, and so forth. Although it is difficult, and perhaps impossible, to handle problems of this sort through legislation, it is reasonable to expect that special education and special teachers might help to overcome some of these things, parental apathy or helplessness, even as

with parents of the physically handicapped.

More important for the consideration of this committee are the facts that many schools and teachers fail to understand and provide for the special educational problems of migrants. Even when the migrant children are welcomed into the school, there is the problem of adjusting school experiences to their immediate needs.

The school is faced with the problem of identifying the academic achievements of each migrant child and placing him where he can make the most progress. The teacher whose classroom may already be crowded is challenged to do everything possible to help these chil-

dren, as well as the regular pupils, live happily in the school as they

work to improve their academic achievements.

This requires much individual teaching and personal attention. It may also require teachers especially trained to cope with language and even cultural differences. Teachers in New York State schools have reported some of the simpler language stumbling blocks. A youngster can't add numbers, as the class has been told to do. He doesn't know about adding. He totes numbers. Yet, despite this above-average need for personal and special attention, these children receive rather less than the average amount.

There is a small community in New York State where, instead of taking these children into the regular classrooms, a single teacher is sent out during the fall months to handle between 40 and 50 migrant children, often ranging from first to eighth grade, in a single class. These children do not mingle at lunch or at recess time with other children in the community, as their classroom is quite isolated, not

only from the school but from the town itself.

Unless the schools accept these children as having a right to their facilities, and even to special facilities provided for their short-time stay, we cannot pretend to be offering them equal opportunities or improved prospects for overcoming the special handicaps they face.

We are concerned here with helping the handicapped achieve a greater degree of independent living. Yet the opportunity to prepare for occupations other than those in agriculture are few for most migrant children. In most schools, vocational guidance programs are scheduled over a school year. Migrant children who attend for only a brief period in each school may not ever get a basic education, much less any of the training, testing, group guidance an individual counseling which is normally spread out over the total period, because they are always behind other children who have had all the services available, and because they do not know how they can carry out any plans they made, they tend to feel that vocational planning is useless.

Migrant children would seldom reach the senior grade in high school, where the year-round program is available in the school for those seniors entering the labor market after graduation. It is not only true that they seldom would reach the senior year; they seldom do. Less than 10 or 15 percent of migrant children ever reach high

school, and a smaller percentage finish.

Despite these odds, one hears sometimes, as recently in newspaper publicity, of the rare case, in this instance two cases, of girls, both children of migrants, having entered a college. We think that more basic elementary education for these children is certainly essential,

and whatever special assistance is needed to assure this.

In closing, we would like to point out the recommendations made and published just this last spring by the Mid-American Conference on Migratory Labor, which was cosponsored by the Council of State Governments and the President's Committee on Migratory Labor. Their recommendations covered children and youth, housing and sanitation, public health and public assistance, governmental and community responsibilities.

We refer only to the eight recommendations concerning children

and youth:

(1) That compulsory education laws be enforced for the migrant child as well as for all other children.

(2) That continuity of educational records about migrant children be available to schools along the migrant route, at least a simple, uniform card to be developed for each child to carry. A sample may be secured for adaptation from the U.S. Office of Education. At best, a folder of guidance material should be sent on by the school. Studies of exahange of rerords in the mid-America schools should be encouraged.

(3) That because the influx of large numbers of children in some school districts places an unusually heavy burden on the school budgets, the States and the U.S. Office of Education should give consideration to the reimbursement of local school districts on a basis similar to other special educational problems, such as handicapped

children and children in federally impacted areas.

(4) That coordinating machinery be established to provide a means of exchange of information and experience regarding State programs of education of migrant children.

(5) That State committees on migratory labor make a study of the State laws to determine actual provisions, both permissive and restric-

tive, for the education of children of nonresident status.

(6) That State and local school agencies enforce attendance at regular schools and that summer schools be established to continue the education of migrant children.

(7) That school and community facilities be available for migrant children and youth as well as to other children and youth of the

community.

(8) That a minimum age be established in Federal legislation for the employment of children in agriculture outside school hours and that special attention be given to the number of hours and conditions of employment under which children and youth are employed in agriculture.

Thank you.

Mr. Elliott. Thank you very much, Miss Gilbert, for your testi-

mony.

If there are no questions, our next witness will be Mr. Irving M. Selis, executive director of the Associated Blind, Inc.

STATEMENT OF IRVING M. SELIS, EXECUTIVE DIRECTOR, THE ASSOCIATED BLIND, INC.

Mr. Sells. Mr. Elliott, I have a copy of my statement, as well as other matters which I wish to include in the record.

Mr. Elliott. Without objection, the statement of Mr. Selis will be received for the record of the subcommittee at a point immediately following his oral presentation.

Mr. Selis. I will give it to the reporter, Mr. Chairman.

Mr. Chairman and gentlemen, I wish to submit for the record several documents which I feel have a direct bearing on the subjects under considertion by your committee. These include statements by Anthony Musillo, 34 Monroe Street, New York City, and Beatrice Lindemann, 22 East 11th Street, New York City: a paper by Mr. Barney Mamet, secretary of the Associated Blind, entitled "Publicity About the Blind, Sense and Nonsense," and a paper which I presented to the American Association of Workers for the Blind at its last annual convention in July.

My paper, entitled "What Hope for the Blind in Tomorrow's Economic Planning," is the result of 40 replies to a questionnaire mailed to all directors of vocational rehabilitation service programs for the blind throughout the United States and possessions. In this paper, as well as in the additional material which I am submitting for the record, you will find a number of recommendations which, I trust,

will prove helpful in your deliberations.

Programs for the training of the blind, without reasonable assurance for remunerative employment, are meaningless, wasteful, and costly, as well as most discouraging and frustrating to the rehabilitant. Frequently, an individual is encouraged to go through several types of training because of failure or inability to find appropriate employment. It is quite apparent to all familiar with this situation of procrastination that an extremely intensive program of public education must be formulated to enlist community resources, including local, State, and Federal Governments, to remove the retrogressive attitudes attached to the stigma of blindness, and thereby provide wider opportunities for employment of the qualified trainee.

Another practical solution to this difficult problem would be the expansion of the principle underlying the vending stand program to other avenues of preferential employment for the blind by the Federal Government. Does it not seem needless, costly, and pointless to have qualified blind people upon completing a period of training re-

main idle or be shuttled back into sheltered workshops?

With regard to pending legislation dealing with independent living, we should differentiate between the philosophy of social service and vocational rehabilitation services. Independent living programs deal with services of self-care, medical help, homemaking, sheltered employment, and homebound occupational therapy. Vocational rehabilitation services should be confined to the responsibility of adjustment and training toward the objective of remunerative employment.

Services toward independent living should remain the responsibility of voluntary and public welfare agencies, since such agencies have always assumed and carried this responsibility. The widespread belief is that the vocational rehabilitation service is charged with the responsibility of providing adjustment and training toward remuner-

active employment.

Is it possible that the proponents of the legislation to include independent living under the jurisdiction of the vocational rehabilitation service have concluded that the program for adjustment and training toward remunerative employment has attained its goal and that the vocational rehabilitation service is now ready to undertake the program for independent living?

The record to date does not support this conclusion so far as the

great majority of blind people are concerned.

Thank you.

Mr. Elliott. Thank you very much.

(Mr. Selis' material follows:)

STATEMENT BY IRVING M. SELIS, EXECUTIVE DIRECTOR, THE ASSOCIATED BLIND, INC.

Mr. Chairman, I wish to submit for the record several documents which I feel have a direct bearing on the subjects under consideration by your committee. These include statements by Anthony Mussillo, 34 Monroe Street, New York

City; and Beatrice Lindemann, 22 East 11th Street, New York City; a paper by Barney Mamet, secretary of the Associated Blind, Inc., entitled "Publicity About the Blind—Sense and Nonsense"; and a paper which I presented to the American Association of Workers for the Blind at its annual convention last July.

My paper, "What Hope for the Blind in Tomorrow's Economic Planning?" is the result of 40 replies to a questionnaire mailed to all directors of vocational rehabilitation service programs for the blind throughout the United States and possessions. In this paper, as well as in the additional material which I am submitting for the record, you will find a number of recommendations which I

trust will prove helpful in your deliberations.

Programs for the training of the blind without reasonable assurance of remunerative employment are meaningless, wasteful, and costly, as well as most discouraging and frustrating to the rehabilitant. Frequently an individual is encouraged to go through several types of training because of failure or inability to find appropriate employment. It is quite apparent to all familiar with this situation of procrastination that an extremely intensive program of public education must be formulated to enlist community resources including local, State, and Federal Governments, to remove the retrogressive attitudes attached to the stigma of blindness and thereby provide wider opportunity for the qualified trainee. Another practical solution to this difficult problem would be the expansion of the principle underlying the vending stand program to other avenues of preferential employment for the blind by the Federal Government. Does it not seem needless, costly, and pointless to have qualified blind people, upon completing a period of training, remain idle or be shuttled back to sheltered workshops?

With regard to pending legislation dealing with "independent living," we should differentiate between the philosophy of social service and vocational rehabilitation. "Independent living" programs deal with services of self-care, medical help, homemaking, sheltered employment, and homebound occupational therapy, while vocational rehabilitation services should be confined to the responsibilities of adjustment and training toward the objective of remunerative employment. Services toward "independent living" should remain the responsibility of voluntary and public welfare agencies since such agencies have

always assumed and carried this responsibility.

The widespread belief is that the vocational rehabilitation service is charged with the responsibility of providing adjustment and training toward remunerative employment. Is is possible that the proponents of the legislation to include "independent living" under the jurisdiction of the vocational rehabilitation service have concluded that the program for adjustment and training toward remunerative employment has attained its goal and that the vocational rehabilitation service is now ready to undertaken the program for "independent living?" The record to date does not support this conclusion so far as the great majority of blind people are concerned.

PERSONAL EXPERIENCES AND COMMENTARY REGARDING THE NEW YORK STATE
COMMISSION FOR THE BLIND, VOCATIONAL REHABILITATION SERVICE

(By Mr. Anthony Mussillo)

I feel that there is strong evidence to indicate that there is wastage and misuse of funds on the part of the vocational-rehabilitation service (commission for the blind). I believe that this organization's performance shows clearly that they are not achieving many of the goals toward which substantial sums of money have been appropriated. I base this opinion upon my own factual personal experiences with vocational rehabilitation and upon similar experiences of other blind individuals with whom I have spoken regarding this. Consider if you will the following sequence of events, and I am certain you will agree that our opinion concerning this organization is totally justified.

Late in the year 1958, I decided, with encouragement from the Associated Blind, an organization truly devoted to the interests of blind people, to attempt to obtain a position in the social-investigator field with the Department of Welfare of the city of New York. Our hope was to obtain a position for me in any one of the number of branches of the social-investigator category, i.o., old age home caseloads, blind assistance caseloads, intake, etc. My own feeling, which was

thoroughly shared by the Associated Blind, was that I was well qualified and

capable of handling several of these positions.

The head counselor at VRS was informed that I was interested in taking the civil service examination for social investigator and asked what my prospects were of obtaining employment in this field. I specifically asked this question of him since I had known that a good number of blind people had taken this examination in the past and had not obtained the position. I certainly did not wish to waste my time or his time in seeking a position for which I could not possibly be certified on the part of the VRS. He told me to "take the examination and then we will discuss it." I could elicit no further statement from him at that time, although I made every attempt to do so. I naturally proceeded to take the examination.

I was shortly thereafter notified by the Civil Service Commission of the city of New York that I had passed the examination with a grade of 89 and that I would need a certification that I could do this work from the vocational rehabilitation service. I made an appointment with the head counselor of the vocational rehabilitation service, an appointment which he was reluctant to give within the

immediate future without my emphasizing its importance to me.

Our discussion began with words to the effect, "Mr. Mussillo, prove to me that you can do the job and I will consider certifying you," I told him that I was a Spanish major in college; that I could both read and write Braille rapidly; that I was a speed typist, having had 8 years experience in transcribing; that I was able to travel with a guide dog or a cane, as the situation might warrant; that the grade I had obtained should indicate to some degree that I was aware of what the position entailed, and that having worked with the department of welfare, typing the work of social investigators for 8 years, grossly added to my knowledge of the functions of this position. I explained that I could do interviewing and interpreting of Spanish in the intake sections of the department of welfare, that an old-age home caseload, I felt, was a strong possibility for a blind person to handle, perhaps a blind assistance caseload or any other related work to this field. I emphasized that I mentioned these positions specifically as outstanding opportunities as they were the self-same positions being held and capably discharged by qualified blind in other States. I showed him a highly complicated intake form which I had obtained from the department of welfare. and which I could fill out myself on the typewriter by a system of tabulations.

The head counselor told me that he could not certify me to do this work. He said that I would have to go out to investigate these positions I was citing; to ask questions of the supervisors in the various sections of my welfare center where I was employed, and find out if they thought I could do this work. If they did, and someone "high up in the department of welfare would give me a letter stating they felt I could handle a particular position," then he would certify me. I stated rather cynically here that perhaps he would want me to obtain a letter from the commissioner of welfare, stating I was qualified and capable of handling a particular position. He responded that if I obtained such a letter, he would certify me immediately and without question. I stressed to him again that other blind persons were handling the same positions in other States. The vague response was that this was New York State and not another State. We went over and over the same ground, but the ultimate result was that I could not obtain a certification of fitness from the VRS. He again repeated that unless I obtained a letter from someone high up in the department of welfare stating that I could discharge the duties of a particular position, he could not certify me. I was told by the head counselor at the end of our interview not to make any further personal appointments with him, but if I had something on my mind, to write him a letter.

I would like to quote here from section 25B of the civil service law, section 3,

which was the applicable law at the time:

"Upon request of an applicant or an eligible for a civil-service position who has been found to be blind, the New York State Department of Social Welfare, Commission for the Blind, shall obtain from such State civil-service department or municipal commission a detailed description of all duties entailed by such position, and shall investigate the extent of the alleged disability by examination of such applicant * * *."

Was it not then crystally clear that when the senior counselor asked me to investigate the duties of the sought-for position, in actuality, he was asking me to do his job? Wasn't it evident that very little if anything had been done in the way of researching these positions when other blind persons had ap-

plied for them to the vocational rehabilitation service in the past? The position of social investigator by the time I arrived upon the scene should have been known thoroughly in every detail and in all its ramifications. Surely, even if the vocational rehabilitation service had done just a small amount of investigation when each blind applicant had applied for this position in the past, they would have amassed a great deal of material concerning the capability of the blind for handling such work. They should without any doubt whatever, be able at this point to encourage or discourage any blind individual as regards this position even before they are close to taking the examination for such category.

Most importantly, isn't it obvious and rather shameful that the vocational rehabilitation service does not feel it really has the authority or power to certify a blind person for a particular position? Such is indeed the case for the senior counselor of the vocational rehabilitation service claimed that he would gladly certify if I could obtain a letter from someone "high up" in the department of welfare. He would certify me immediately, he claimed, if he had a letter from the commissioner of welfare, and, too, he requested that I get a statement from some supervisor in the department of welfare stating that they felt I could handle specific work in their unit. In effect, this man was strongly indicating to me that he felt he was powerless to certify me or any other blind person for such a position before someone else gave him the authority to do so. In other words, I was asked by the city of New York to obtain certification through him and he in turn was asking me to obtain certification from the city of New York. This is indeed a sad game to play with the professional futures of qualified blind. Doesn't it seem just from a very cursory inspection that these counselors are really asking their salaries for acting as glorified clerks? If they do not wish to get out into the field and investigate the details surrounding specific positions, to help create new positions, to present the blind as capable, rational-minded adults, and to pursue the interests of the blind in every way they know how, then it is better that clerks be hired for the vocational rehabilitation service at much lower salaries.

It is almost slanderous on the part of the head counselor to request no further personal interviews with a client but rather that communication take place by mail. There would be no reason for a counselor to shun a discussion with a blind client seeking a position. A letter can be thrown into a file or into

a basket.

As all these factors made a strong impression upon me at the time, I wrote the senior supervisor of vocational rehabilitation service in Albany expressing to him completely in a detailed accounting just exactly how I felt on this matter. Through this letter and aided by the Associated Blind, we obtained an interview in the offices of the vocational rehabilitation service here in New York City.

Representatives of the Associated Blind and I expressed ourselves concisely and emphatically on this subject at the meeting. When I indicated to the senior supervisor of vocational rehabilitation that I was being refused certification for a position that was being adequately discharged by blind in other States, his response was "Well, perhaps we are a little slower in New York; that could be it." We received vague and inadequate responses to most of our queries and the ultimate result of this meeting was that vocational rehabilitation would see what it could do for me.

Ultimately, vocational rehabilitation service did for me what it has done for all the other blind individuals applying for this position which I think the records will show, isn't a great deal. I am wondering at this point what will happen to the next blind person who contacts vocational rehabilitation service for advice as to whether they should take the social investigator examination. What will it take to get this organization to finally admit that they are unable

to cope with the situation?

Here is indeed a case of wasteful use of government funds. Not only are salaries being paid to counseiors at the vocational rehabilitation service who are not performing the functions of their jobs adequately, but the goals for which the government funds are being appropriated are not being at all realized. Then too, the vocational rehabilitation service has spent a good deal of money to help blind people through college and through training courses. If all we can expect after going through college or specific training for employment is the menial task of transcribing typist, or work in a sheltered shop of one of the organizations for the blind, then these moneys are not serving the proper purpose. It has come to pass with most of the blind who are put through college on vocation rehabilitation service funds that the college education becomes the

end itself and not a means to an end. Going through college for a blind person is not a desire on his part to fill the 4 years between high-school graduation and unemployment, nor is it a desire to act as a bridge from high school to a dieta-

phone machine or work in a sheltered shop.

The blind who attend colleges and training courses spend many, many hours and much effort in learning various skills. Their aspirations are for someday to hold dignified positions; positions that will provide adequate incomes for their families; they want just as strongly as does any member of society to live as first-class citizens and decent human beings. If we are forced by the existing laws to turn to the vocational rehabilitation service for certification to perform a certain job, then it is essential for the dignity and very livelihood of the blind that vocational rehabilitation service be capable, be influential, fulfill its duties and obligations to the blind thoroughly and courteously and to realize above all when they should or should not encourage a blind person in his pursuits. If the vocational rehabilitation service continues to take the same attitude as they have in the past, which is quite comparative to the attitude of many private employers as regards the capabilities of blind individuals, then the sightless of New York are burdened with the organization that was really meant by the government to do so much for them.

It is imperative to remember that the blind of New York did not give vocational rehabilitation service the privilege or authority of having to certify them for desired employment. This power was given to them by law. We, unlike sighted people, have to have someone else judge our capability of performing certain duties. Someone else must judge us and their judgment is final. I discussed this law, then section 25B, with an attorney, and I was informed that he believed the Supreme Court would certainly declare it unconstitutional. He told me that it was a most flagrant violation of a citizen's rights. His contention was that if it came to pass that madmen controlled the vocational rehabilitation service, the law still would give them sole authority to certify upon the

capability of blind individuals to hold certain employment.

It is conceivable that vocational rehabilitation service may need a separate division to handle the problem of professional employment. It is conceivable that they require a whole reevaluation and revamping of their methods and personnel. It is certain that steps must be taken to correct the unfortunate injustices and wasteful economic practices that have been taking place for so

long.

Finally, I would like to noint out here that I believe the individual blind person's opinions and factual experiences are much more weighty and meaningful as regards vocational rehabilitation service than would be some organizations for the blind in their attitude. Their opinions are violently prejudiced in favor of the vocational rehabilitation service because of the fact that they receive large sums of money in the form of training sums for the blind they supposedly set on the path to economic security. They cannot be expected to disagree with practices in which they themselves indulge. Let us only hope that somehow society will grow to learn what they really accomplish.

NEW YORK, N.Y., October 26, 1959.

Miss Sarah Neufeld, Associated Blind, New York, N.Y.

Dear Miss Neufeld: In connection with my recent experience with the Vocational Rehabilitation Service of the New York State Commission for the Blind, I wish to state that the contents of this letter is in no wise a criticism, but rather an attempt to indicate how the service can be of greater help to the blind.

As you know, I have had 35 years of business experience, 25 of which were in an executive capacity with one company. My former employers were men of stature and achievement, among them the late Fiorello H. LaGuardia. I

mention this only to indicate the scope of my experience.

It would seem to me that were there some way devised so that all blind people needing rehabilitation were not segregated like second class citizens and given more individualized attention, the program would be greatly improved. In other words, I saw people from all walks of life, of all capabilities and potentials, lumped together without too much regard for background or future potential. Despite the fact that I have lost my eyesight. I am sure that my intelligence has been in no way altered nor has the experience I have gained in any way

been diminished. I held a position as assistant to arbitrators; I have the ability to talk to people and smooth ruffled feathers; I have a knack of bringing together persons diametrically opposed and reaching a meeting ground. Therefore, for me to become a transcription typist seems rather a waste of talent. I started out 35 years ago as a typist; the loss of my sight now seems to turn the calendar back that many years.

Rehabilitation, in my opinion, should have a large staff of qualified persons in the personnel field; people who know how to place people and then sell these qualified people to employers. Also, a great deal can and should be done

to educate the public and employers.

Rehabilitation is fine, but I don't think in its present state it goes far enough. If the contents of this letter is of any value, you may have my permission to use it.

Sincerely yours,

BEATRICE LINDEMANN.

PUBLICITY ABOUT THE BLIND-SENSE AND NONSENSE

(By Barney Mamet, secretary, the Associated Blind, Inc.)

(Presented at the 44th annual conference of the New York State Federation of Workers for the Blind in New York City, September 18, 1958)

It is with some apprehension and misgiving that I approach and explore the subject: "Publicity About the Blind—Sense and Nonsense." In a paper of this length, justice cannot possibly be done to the vast scope and complexity of this multifaceted subject encompassed in the all-inclusive term "publicity," which is closely identified with its twin sister professions of fund raising and public relations. Especially is this true in our day and age of strong pressure groups with each jockeying for popular approval and special legislation; of the various-media of farflung communication and rapid transportation with the power as never before known in history for disseminating information to every part of our world; and of large scale promotional campaigns which run the gamut of human emotions to make the contributors' tears flow fast and their dollars even faster.

This subject becomes further complicated when we enter into the area of what should constitute the criteria for proper ethics and practical standards intended to help crystallize most effectively the noble motives and avowed purposes of numerous and diverse philanthropic organizations which of necessity must perpetually rely upon the financial support and sympathetic interest of the general

public in order to survive and carry on.

While publicity is the lifeblood of philanthropy just as advertising is to commerce and industry, charitable organizations, unlike big business, must take into account the added factors of social responsibility to those they serve as well as the faithful discharge of their stewardship with which they have been entrusted by public-spirited citizens, or, if you will, by their contributors whose goodwill and generosity must be courted, counted upon, and continually cultivated to keep pace with the increasing demands of blind people for expanding services.

For these and other reasons to follow, I am quite aware of the formidable task I have embarked upon and of the hazardous course to be navigated between Scylla and Charybdis—between those who are professionally engaged in the field of publicity and who generally assume the position that the means in whatever manner, shape or form the exigencies of any given situation may call for justifies the end; and those comprising a large segment of the blind who are unalterably opposed to any type of publicity which would tend in the slightest degree to compromise their idealistic goal for equal status in the sighted community without due regard for the realistic means required to bring about this ultimate end.

The professionals know only they have a job to perform; namely, to ascertain the most immediate and effective way to publicize an individual, event or certain phases of work for the blind to attract public support and the largest amount of money possible for the particular organization employing their services. With this sole purpose in mind, fund raisers and directors of public relations are not above using expediency, distortion of ideas and facts, highly incredible situations, fantastic and exaggerated portrayal of the blind person's accomplishments, words and phrases of misleading symbolism, the overwhelming dramatic impact

of the so-called "human interest" stories; the heartrending and stirring appeal to human emotions and subconscious prejudices and many other devious devices calculated to evoke the desired public response. In their zeal they lightly shrug off the actual truth and real facts if such should prove an obstacle to their assignments. More often then not they perpetuate and care less about dispelling the existing prejudices, traditional attitudes, and stereotyped images that the public has about the blind person pictured as helpless, dependent, and inept. It is regrettable that these publicists who wield tremendous power and can be such a significant force for good have little or no knowledge of the historical struggle of blind people to shake off the shackles of their handicap with its concomitants of pity, ineptness, condescension, discrimination, invalidism, beggary, and wardship. Their ignorance of such matters is appalling and their indifference to any attempts to alter their practices and channel their efforts into more enlightened directions is, to say the least, exasperating to blind people desiring and working for social equality and economic independence in the sighted world. They merely smile indulgently at such efforts as though to imply "I know my business and you know yours but don't let one interfere with the other."

However, the overwhelming majority of blind people and many of the blind workers within and outside of organizations for the blind are very resentful of much of the publicity material foisted upon the gullible public. They feel that progress in work for the blind would have been much further advanced were the professionals required to possess greater integrity and knowledge of and expected to work more closely with their respective organizations in work for the blind. Blind people feel that their dignity, self-respect, and aspirations ought never to be sacrificed or even compromised for the sake of "publicity" particularly when doing so characterizes and retains the worst features of the past. They too must face the undeniable fact that the stereotyped prejudices, traditional attitudes, and misconceptions encountered in everyday life are deeply rooted in humanity and have come down to us from antiquity itself. The psychological implications and social ramifications of the handicap of blindness appear in so many subtle and disguised forms and vary so widely from one part of the world to another, indeed from community to community, that it is well nigh difficult to eradicate or even reduce to any appreciable degree as rapidly as one would wish the gulf that still exists between the blind and the seeing. despite the advanced media and increased knowledge at our disposal. In short, the blind disposed to intellectual honesty and objectivity cannot themselves all agree as to what would be the most realistic and practical manner to realize complete social adjustment and acceptance totally free of any conscious or subconscious feeling that somehow "differences" do still exist.

In his book "Adjustment to Physical Handicap and Illness," published by the Social Science Research Council in 1947 and revised in 1953, Barker points up several interesting facts to explain these seeming inconsistencies among the blind and workers for the blind. He states that: "No group among the physically handicapped in the United States has been so favored by special legislation as the 'legally blind.'" Further on he says: "No other groups concerned with the disabled appear to be as well organized and as well financed as the associa-

tions for the blind."

In the same book, however, Barker makes the keen observation that: "Few disabilities have been the object of such early and lasting concern as loss of vision." And in dealing with the social significance of blindness, Barker also observes: "There is general agreement that the severely impaired vision is a misfortune, and in only a few scattered instances have any advantages been claimed for blindness." The history of the blind leaves no doubt of the truth

of these observations. It is of paramount importance to bring all our knowledge and resources to bear upon the problems concerning us today. During the last 20 years or so, much greater progress of a fundamentally sound and realistic nature has been made then ever before in the history and development of work for the blind. Through the efforts of agencies for the blind and that of the organized blind themselves, it is becoming evident, more and more, that public education offers the best key to the field of public relations—of bringing genuine understanding and keen insight and analysis into the attitudes which the seeing and the blind feel toward each other. By eliminating all of the nonsense and misinformation so prevalent in much of the publicity, and which causes confused thinking among the seeing and disillusionment among the blind, and by making sure that only such publicity that will reflect sense and truth in convincing and unadulterated presenta-

tion can we hope to cut through an apparently hopeless problem. To make a suitable beginning, both extreme positions must be avoided with due respect for each other's point of view and experience. It is incumbent upon all of us to resist the timeworn temptation to exploit the motif of polarity in publicity. It does not make for enlightenment or understanding and serves no worthwhile-purpose to picture blind people either as "geniuses" or as "pitiable beggars"; to place them on pedestals endowed with extraordinary virtues or have them grovelling in utter abjection; in surrounding them with a halo of flawless admiration or brooding in hopeless resignation; performing incredible feats of ambitious enterprise or living in pathetic helplessness.

In connection with the age-old tendency of seeing people to think of the blind in extreme opposites, it is interesting to note that in separate studies made by Patterson and Langworthy over 25 years ago, they found that over 300 books contained a blind character. Both arrived at a similar conclusion that thesebooks portrayed the idealized and abnormally good blind person exemplified by Bertha in Dickens' "Cricket on the Hearth" as contrasted with Pew in Stevenson's "Treasure Island" as the repugnant and abnormally bad blind person. These investigators also pointed out that the clever and capable blind man is found in fiction occasionally and that the normal well-adjusted blind man is rarely found This practice is still carried on in the press, radio, and television. Blind people who have acquired a very high degree of adjustment and proficiency in conducting their lives to the satisfaction of those about them are not usually considered newsworthy. The fact that quite a number of blind people have learned to master and participate with considerable ease in those events and activities that are commonplace in the workaday world does not lend itself to "good publicity." Obviously, in such an atmosphere permeated with such inconsistency, cross-purposes and misplaced emphasis on the proper values, something: undoubtedly is fundamentally wrong and unsound.

Not many months ago one of the best known agencies in Greater New York presented a TV broadcast of its overall program concerning its work on behalf of the thousands of blind people it claims to serve. The well-known commentator and interviewer asked several questions which were echoes out of the dark medieval past. Such questions as "Would you rather be dead than blind?"; "Do you have any fun?"; and "Have you ever known blind people who have committed suicide?" were deeply resented and deplored by blind people. The implications of these questions could only have left a most negative impression.

upon the viewers and listeners.

Then about a year ago a series of tape recordings for radio broadcasting wassubmitted throughout the country by one of our national organizations which
purports to advance the cause of the blind in every way possible. Nevertheless,
these tapes were replete with words and phrases which were misleading in their
symbolism and connotation. Expressions as "in the valley of the shadow,"
"buoyant spirits," "milk of human kindness," "joyful noises," and the like only
accentuate rather than diminish the proverbial gloom and darkness in which the
blind are supposed to dwell.

And then there was a story of the successful blind insurance agent. It said that he was not known to be blind to his clients at their first meeting because of his exceedingly normal manner and behavior. The story went on to say that whenever it became necessary for him to look up rate schedules he would do so by putting his hands into his briefcase to read the braille notes without exposing them. Since this blind man was supposed to have been successful, why was it necessary for publicity to utilize the angle of an uncanny and abnormal type of behavior?

However, one cannot help but wonder how much publicity has really donefor the braille system. For recently, over one of our national radio networks
a most prominent and liberal news commentator was interviewing a gentleman
from one of the Asiatic countries. He was describing the poor conditions of his
people and their widespread illiteracy. At this point the commentator remarked
that "a man who cannot read is like a blind man." Certainly such sweeping
generalizations leave the erroneous impression that the blind man is inferior,
helpless, and lacking in ability and learning.

Several years ago quite a furor arose mong the blind and workers for the blind when in a certain moving picture the actor who played the role of a blind man felt with his fingers the facial features of his sweetheart and was thereby able to describe how beautiful his girl was. This scene stirred and captivated the seeing audience not realizing how the movie moguls played upon their credulity

and emotional sympathy because they wanted to believe that blindness had its compensations by giving the sightless person supersensitive fingers and miraculous power not to mention, of course, the heroine's faithful love to the man who had become blind.

Such instances can be multiplied ad infinitum. As stated at the outset, it would be impossible to cover the many facets involved in publicity. However, I believe that the paramount issues and broad aspects of this subject have been touched upon sufficiently to indicate areas which call for serious consideration and reappraisal of that kind of publicity which will emphasize reality and avoid the extremes; to infuse sense into our publicity and eliminate therefrom the nonsense which has prevented a realistic appreciation of the blind person by the public.

WHAT HOPE FOR THE BLIND IN TOMORROW'S ECONOMIC PLANNING?

By Irving H. Selis, Executive Director, The Associated Blind, Inc. (Presented at the 33d annual convention of the American Association of Workers for the Blind in Detroit, Michigan, July 8, 1959)

Among the numerous problems which have remained the most difficult and baffling in the area of work for the blind is that of creating or finding opportunities for their adjustment and ready acceptance into the economic structure of society. Hence, about 2 months ago, when I was asked to prepare a paper for this convention dealing with the "Economic Picture 1959 In Relation to Services and Resources," I was reluctant to undertake at such short notice this formidable task. But the sober realization of the importance of this subject impelled me to make a beginning with the hope that from this spadework there would develop a concerted and realistic effort by all of us in the American Association of Workers for the Blind to reevaluate the rehabilitation and employment programs for tomorrow's economic planning for the blind.

Since the training, rehabilitation, and employment of blind people flow from the mainstream of the vocational rehabilitation service program, it is only natural to have centered our interest in this area. No one can question the tremendous impact which this program has brought into the lives of blind people for their rehabilitation and employment opportunities. However, after 15 years of operation it has been the feeling of professional and lay workers alike that in the light of certain glaring deficiencies that have developed, the program calls

for review and analysis; thus the need for this survey.

In order to gather the data pertinent to this paper, which I feel can only be considered an outline for a broader study of this subject, I sought the aid of all directors of State vocational rehabilitation service programs for the blind. Realizing that time was limited, and mindful that their duties might not permit them to reply to a more lengthy and searching questionnaire, I confined it to 11 questions which I thought would be specific in nature and simple to answer. In addition to the 49 States, questionnaires were sent to the District of Columbia, the Virgin Islands, and Peurto Rico. Although the Virgin Islands and Alaska responded, they are being omitted from this study because their programs have only recently been instituted. Of the remaining 48 States, the District of Columbia, and Puerto Rico, 39 States and the District of Columbia, or 80 percent responded.

While it was felt that the completion of the questionnaire would merely involve established agency experience and consultation of records, some of the responses proved most unexpected and revealing. For example, in response to question 7. "Total caseload during last fiscal year," such replies were given as "Unknown": "I do not have this information available"; and "This information was not provided by our counselors."

Question 1, "Name of agency director." was asked for the purpose of reference in the event that followup correspondence would be necessary. Evidently this question proved somewhat difficult in three instances as the name of the agency

itself was given rather than that of the director.

Answers to questions 2 through 8 have been analyzed and tabulated statistically in a chart appended to this paper. The purpose of these questions was to ascertain the total caseload in the last fiscal year, the number of connselors and number of placement officers, and their classification as to "blind," "with useful vision," and "sighted"; and classification of agency director as to "blind," "with useful vision," or "sighted."

The chart is composed of seven columns, divided into five groupings. The columns are headed as follows: "State" (indicated by number, starting with State having highest prevalency of blindness¹); "Caseload in relation to estimated prevalence of blindness"; "Placement in relation to caseload"; "Average caseload per counselor"; "Average placement per placement officer or counselor"; "Counselors and placement officers," "Blind," "With useful vision," "Sighted"; and "Director," "Blind," "Useful vision," "Sighted." Group A includes States having a prevalency of blindness of 20,000 and over; group B, 10,600 to 20,000; group C, 5,000 to 10,000; group D, 2,000 to 5,000; and group E, under 2,000.

A careful scrutiny of the chart brings to light a number of interesting factors.

However, time will permit a discussion of only three of them.

In comparing State B-4 with State A-1, ertain important differences are to be noted. State B-4 has a prevalency of blindness of 11,000, a caseload of 1,500 and 270 placements as against State A-1 with a prevalence of 28,000, a caseload of 900, and 209 placements. These figures raise several questions. When we realize that State A-1 is the wealthiest State, the most highly industrialized and diversified, and exceeds the prevalency of State B-4, which is semiagricultural in character, by almost two and one-half times, the question arises as to whether State A-1 is understaffed in its vocation rehabilitation service pro-

gram or whether State B-4 is doing a much more effective job.

Furthermore, State A-1 has 11 counselors, all of them sighted, while State B-4 has 8 counselors, 5 blind, 1 with useful vision, and 2 sighted. Is it possible that State A-1, in order to maintain a record equal to that of State B-4 both in caseload and placement, should increase its staff proportionately and include blind counselors and placement officers? Does it not seem altogether fitting in a program designed to find employment for blind people and to demonstrate to the public the capabilities of the blind themselves that vocational rehabilitation service agencies should be the first to set the example? These two States were selected for comparison to point up the inescapeable observation that blind people can be employed as counselors and placement officers and can perform their jobs with creditable results.

Comparing State A-2 with State A-3, where the prevalence of blindness is approximately the same and where both agencies employ blind counselors predominantly, namely, 10 out of 18 for the former and 14 out of 16 for the latter, it is to be noted that for the last fiscal year State A-2 showed 264 placements out of a caseload of 455 (58 percent) as against 197 placements out of a caseload of 1066 (18.4 percent) for State A-3. There is a most striking difference in placement of 40 percent between these two States. One cannot help but wonder about the market difference in the record of achievement for State A-2 when State A-3 has in excess of 2 million population, is much more highly industrialized and its history and experience in work for the blind are much older and more extensive.

To further illustrate the need for a more comprehensive study of the overall vocational rehabilitation service program is again borne out by the comparison between State C-10 and State C-4. The difference in the prevalence of blindness between these two States, located in the same geographical area, is approximately 2,000 more for State C-4. Comparative figures for these two States show that the staff of C-10, consisting of 1 blind and 10 sighted counselors, carried a caseload of 882 and placed 169, while State C-4 with 2 blind, 2 with useful vision, and 34 sighted counselors, carried a caseload of 600 and placed 63.

The comparison between these two programs is of especial interest since State C-4 is a multiple agency in which service to the blind is integrated with all other physically handicapped groups, and State C-10 is a single agency serving the blind only. Here again we are confronted with the long debated issue as to whether the needs and interests of the blind are not sidetracked and lost when grouped with other physically handicapped rather than being served as a single unit. This observation seems to be similarly true in other States maintaining a multiple agency program.

With regard to question 9, "Number of legally blind people in the State now employed * * *" in five major categories, "blind" and "with useful vision," it is gratifying to note that 17 States do maintain such records in one form or another. It would seem desirable that all States maintain such records so that periodically employment figures could be gathered as a yardstick to measure the

¹ American Foundation for the Blind, "Estimated Prevalence of Blindness as of June 30. 1958."

progress for total employment of the blind as well as for various types of employment. Such a complete record would serve as a helpful guide toward determining what types of employment over a period of time would prove most suitable for the blind and the visually handicapped to enter from the viewpoint of equal competition, permanency, and compensation. The replies to this question were not tabulated because they did not furnish a broad enough base from which any definite conclusion could be derived. However, it should be mentioned that in the interest of fair and just legislation to the totally blind, and to clear up the existing confusion in the mind of the public as to the wide variation in degree between the totally blind and those with visual acuity of 20/200, serious thought should be directed to this area of our work.

A further examination reveals that a considerable number of housewives and homemakers were included in the figures given as placements. Since the term "placement" is interpreted as remunerative employment, and while no one will deny that the little woman's work is never done, is the housewife or homemaker to be considered a placement? One State included 43 such placements in its total figure. Is it possible that in some States the program has reached the bottom of the barrel? Though no one can dispute the value of giving training and rehabilitation to housewives and homemakers toward social adjustment and independent living, it is difficult to reconcile these accomplishments in the light of employment.

Another unusual matter that comes to our attention concerns the "Number of blind persons rehabilitated, by job or occupation at closure, fiscal year ended June 30, 1957," found in "Rehabilitation Service Series No. 450, Supplement 7," issued by the Department of Health, Education, and Welfare. Included in this list are to be found such jobs and occupations as "accountants and auditors," "trained nurses," "draftsmen," "bookkeepers and cashiers, except bank," "waiters and waitresses, except private family," "sheriffs and bailiffs," "brick and stone masons and tile setters," "firemen, other than process firemen," and "chauffeurs and drivers of motor vehicles." While this report informs us that these people were blind when accepted for service, it would appear that their sight was restored in order for them to hold down such positions.

It is most commendable for the vocational rehabilitation service to render eye restoration service, but would it not be in the interest of accurate recording to list such achievements under the category of "sight restoration" rather than employment under blindness? In the first place their employment is not obtained as blind people but as people who can see. Secondly, it is not fair to the blind to constantly have to combat the false impression that prevails in the mind of the public that they are "geniuses" and perform unbelievable feats. If the doors of opportunity for the blind in tomorrow's economic planning are to be swung wide open, one of the necessary steps to be taken is to gear our publicity so as to avoid exaggeration on the one hand and false sentiment on the other.

The following is quoted from an article that appeared in the press within

the past month:

"One of the first basic things that (name of agency) teaches is posture and stance to avoid accidents. When 'Mary' lights a gas oven she does not lean over as do most housewives. Should she lose her balance there might be an accident. Instead she gets down on her knees. Housewives with normal sight might learn from 'Mary' a number of safety techniques for the tasks of homemaking."

In order for a blind person to be trained and rehabilitated to assume a normal place in society, it is necessary to depict a blind person doing the "abnormal"

thing to prove that he is normal?

On the one hand the vocational rehabilitation service disseminates publicity to the effect that a blind person has been prepared to go out and do a day's work and take his rightful place in society as a normal human being. On the other hand, the private agency for the blind is unashamed to resort to any type of publicity which will play upon the sympathy of the public for the purposes of raising funds. (A treatment of this subject has been covered in a paper entitled "Publicity About the Blind—Sense and Nonsense." by Barney Mamet, secretary of the Associated Blind. This paper is available upon request.)

With reference to question 10, "Describe the training facilities used in your program such as private agencies for the blind, other community facilities, etc.." most of the replies indicate the use of private agencies, schools, colleges, trade schools, etc. However, there is a strong emphasis on the need for more practical

training facilities and on-the-job training.

With regard to question 11, "In your opinion what type of program should be instituted for improving employment opportunities for the blind on local, State, and National levels?" 11 States did not answer. One State indicated its satisfaction with the program as it now exists. Of the remainder, it was the consensus of opinion that much more emphasis and planning should be devoted to public education with particular stress upon obtaining the cooperation of private industry and greater governmental participation through programs of appropriate legislation and implementation. Some felt that the President's Committee on Employment of the Physically Handicapped should also be extended to State and local levels with Governors' and mayors' committees.

The following are a few excerpts from the replies of several State directors in

answer to this question:

1. "Extensive adjustment training such as travel training, manual dexterity, etc."

2. "More emphasis on training, better supervised training, and much more

sincere effort on the part of the agency for placement."
3. "Staff workers who will get out and do the job; all talk and no pay makes client dubious of service programs. Staff must be trained and function after training."

4. "A good employment program for the blind cannot be developed unless the workers in agencies doing work for the blind really believe what they say when they talk about the fact that the blind are employable. The most important single qualification of a worker in a program for the blind should be his belief that the average blind person can do the average job in the average office or factory if he gets training and opportunity. If the workers really believe this (emotionally as well as intellectually), if they are not simply giving lipservice to the idea, the rest will tend to follow naturally."

5. *** * An expansion of public interpretation activities at all levels would be productive of more work opportunities for blind persons. It would also assist in the effort to let all blind persons know about the service programs

available."

6. "A long-term educational program alerting employers to the skills trained blind workers can develop. This program should be extensive in scope, and extensive in nature, and carried out by skilled public information specialist."

7. "More expert field consultants in the Federal Office of Vocational Rehabilitation who could visit the States. Have some organization (possibly the NRA office) serve as a clearinghouse for all questionnaires."

8. "(a) An effort on the national level aimed at opening up large industries to

the blind whose policies are now opposed to the hiring of the blind.

"(b) A study of the effects of automation on the hiring of the blind and meth-

ods of obviating these effects.'

In reviewing, analyzing, and evaluating the program of training and employment for our blind in tomorrow's economic planning, we must pursue a realistic course. Within the realm of public education we must enlist the cooperation of those employers now hiring blind people to constitute themselves into committees with a view of spreading the word to other employees within their industries as to the capabilities and satisfactory work records of the blind people they themselves employ.

As another effective weapon in this crusade, a progress report of the vocational rehabilitation service program should be mailed periodically to prospective employers, noting the areas of employment which the blind have filled with creditable success. This procedure could also serve as the door opener for placement officers.

Legislation should be enacted in which employers receiving Government contracts would be required to hire blind people after it has been established that certain operations can be performed by them.

As an incentive to employers to hire blind people, a provision for a tax reduction plan should be considered as another practical measure.

As an extension of the principle of the vending stand program, preferential status should be considered in the field of piano tuning and cityl service opportunities where it can be demonstrated that blind people can qualify.

If the hopes of blind people are to be crystallized through our planning for tomorrow, such measures and recommendations as herein suggested must receive our serious and immediate consideration. Less procrastination and more determination will spell the difference between failure and success of what was meant to be a most effective and worthwhile program. Study and analysis of vocational rehabilitation service program for the blind

Mr. Elliort. Our next witness will be Miss Sylvia Golden, of the League In Aid of Crippled Children.

Is Miss Golden here?

I will now recognize the gentleman from New York, Mr. Wain-

wright, who will present the next witness.

Mr. Wainwright. Mr. Chairman, it is a pleasure to present to the committee the representative of the New York State Mental Health Board and also the Mental Health Board of Suffolk County, a county of about 600,000 inhabitants outside of New York City.

Mrs. Huntington, would you come forward and give your testi-

mony?

Incidentally, Mrs. Huntington is the wife of the New York State Assemblyman from the Second Assembly District in the State of New York.

Mr. Elliott. We are happy to have you. Mrs. Huntington Thank you very much.

Mr. ELLIOTT. Mrs. Huntington, let me say that when you have finished, if you summarize your statement, the entire statement will go into the record.

You may proceed.

STATEMENT OF MRS. PRESCOTT B. HUNTINGTON, SKILLS, UNLIMITED, ST. JAMES, LONG ISLAND, N.Y.

Mrs. Huntington. The needs in the field of mental health, financial and otherwise, are numerous and glaring. The progress made in the past 6 years in the treatment of the mentally ill has been the direct result of research and is an indication of future advancement yet to come.

I have selected four categories where I feel that encouragement from the Federal Government would further the findings of the past 6 years, producing results which could be felt throughout the Nation.

(1) Federal money is being used to help support nursing homes for the aged, homes for the blind, homes for handicapped children, and for the disabled. In the event that a patient in these homes is diagnosed as mentally ill, this Federal money is no longer available to them, and the patient then becomes a State responsibility and is removed to the State hospital.

If the illness is diagnosed as of a mild nature, it is entirely possible to care for these patients within the walls of the private institution, thus allowing them to remain in their present environment and in surroundings which are more suited to their needs than that of a State

institution.

It is suggested that Federal funds be extended to include the care of patients with mild mental disorders within the confines of the pri-

vate nursing home or institution.

(2) The Hill-Burton Act provides for the distribution of Federal funds for the construction of hospitals, nursing homes, public health centers, and diagnostic centers on a third of the cost basis. There is a great need for day centers for emotionally disturbed, handicapped and retarded children, where those with an IQ of 50 or less can be educated in terms of their own capacities, and where psychological services can be made available to them.

The worth of these centers has already been proven. There is a State operated one in Delaware, and I believe five or six more throughout the country. The place for these children is not within the walls of the public school, for their needs are so specialized and the training that they require so far removed from that of their normal brothers that it is imperative that they have a center quite apart from the local school.

The removal of the burden of these children from their homes for at least a few hours of the day will make for ease and easing of the tensions within those homes and for better regulation of the lives of

their families.

The second change that I would suggest in the Hill-Burton Act is a provision for the construction on a third of the cost basis of half-way houses for patients released from State hospitals. It is common knowledge that a discharged patient from a mental institution is in need of assistance in returning to the community. It is also a fact that very often the family of the patient is often unable to give the proper help and encouragement to their relative, either through lack of understanding of the problem, through an inability to know how to cope with the patient, or because there is no one at home during the day.

A center that would be either a residential and/or a day center where released patients could be helped by trained social workers to return to industry, where they could be encouraged to stay in their jobs once the jobs had been acquired, and where the bereavement from the shelter of the mental institution could be lessened, would accelerate release from the institution and encourage the community to take

responsibility for its own people.

There is a great lack of public support for the group of children who will never be able to participate in the normal life of the community, and for the recently released mental patient. I believe that an amendment to the Hill-Burton Act providing for the construction of day centers for children and halfway houses for released mental patients would encourage communities to visualize the needs for these services as well as make it feasible for them to embark on such projects.

(3) A rehabilitation program within the walls of a State hospital is a sorely needed program. To place within these institutions vocational counselors, trained to teach the skills required for industry, trained to raise the standards and talents of the individual, and trained in the art of family and marital counseling, would assist immeasura-

bly in the recovery of the patient and in his return to society.

Teams embracing all of the disciplines made up of all of these trained persons who would maintain contact with men and women of the community to which the patient was returning, and who would work with the patients in applying all of their varied skills to the final release of the patient, would be of inestimable value. An appropriation from the Federal Government to be administered by the Department of Mental Hygiene, that would make teams of this description available to our mental institutions throughout the Nation, would shorten the length of time a patient had to spend in a hospital and terminate the financial responsibility of the State to the individual at an earlier date.

(4) Trained personnel in the field of social work is very scarce, and ways and means of inspiring young people to embrace this profession are very much needed. With the financing of schools of social work and the creation of scholarships to alleviate the financial burden of graduate studies, the shortage of trained counselors could be met and the field of rehabilitation in the area of mental health greatly enhanced.

These four channels for Federal appropriations would do much toward assisting those less fortunate to become useful members

of society

Mr. Elliott. Would you tell us what your definition of a half-

way house is?

Mrs. Huntington. It would be a shelter where released mental patients, people who are not thoroughly adjusted to return to the community, but who no longer needed the assistance of the hospital, itself, could either reside or use it as a day center while they are

becoming readjusted to the community.

Often a mental patient who takes a job and seems to be securely established in that job finds after a week or 2 weeks that it is more than he can manage, and he has to get away. It takes time on the part of the social worker to urge that individual back into the job, and it often cannot happen. With an understanding employer, this can take place.

You can imagine the therapeutic advantages from such an experience. That is only one of the many ramifications. The outstanding halfway house, I think, is Fountain House, in New York, which is doing a wonderful job along these lines, with the help and cooperation of employers in the neighborhood, with a trained staff of workers

to assist these people.

Mr. Elliott. Thank you very much, Mrs. Huntington.

Our next witness is Miss Sylvia Golden.

Is Mr. Horace Mann, director, College for Teachers, present?

Mr. Bernard Frankel, executive director, Long Island Consultation Center?

Is Mr. Thomas Huhn present, from Ashville, N.Y.?

Mr. Huhn, you may proceed. When you are finished, your statement will be made a part of the record. If you will, cooperate with our time limitation. It will be appreciated.

STATEMENT OF THOMAS H. HUHN, R.D. 1, ASHVILLE, N.Y.

Mr. Huhn. Thank you.

I wish to submit a short history of one person's injury and the experiences of one community in meeting the rehabilitation needs of this one individual. In my opinion, her experiences and the efforts of the various agencies to meet her rehabilitation needs speak quite directly in defining a specific type of facility that deserves Federal support and extension.

On July 14, 1958, Miss Sharon Hovey, then 16 years old, fell in Genk, Belgium, fracturing a vertebra with resultant almost complete paralysis. At this time she was in Belgium under the Americans Abroad program sponsored by the American Field Service. The Belgian medical authorities went to uncommon lengths in securing

special stretcher from London, and moving poles and trees in Genk

to permit a helicopter to transport her to Brussels.

She was joined there by her mother during the 2-month period that elapsed before she could be brought back to the United States by plane. Arrangements for her Belgian medical care and special transport back to the United States were made by the AFS. The neurosurgeons who attended her for this period donated their services as a gesture of good will toward Sharon and in friendship for the United States.

Exchange of medical information between the doctors on both sides of the Atlantic resulted in seeking admission for Sharon at the New York University-Bellevue Institute of Physical Medicine and Rehabilitation in New York City. She was a patient here from September of 1958 until April 1959. Medical diagnosis and treatment, testing, educational and vocational guidance, physical therapy, rehabilitation training and an understanding climate for the necessary adjustment to a severe disability were provided for Sharon at this comprehensive rehabilitation center.

At the time of her discharge in April, she had progressed sufficiently to permit home care. Although her fingers were paralyzed, she had mastered eating, writing, and many ordinary tasks so routine and automatic for normal people. Through special arrangements made by the principal and faculty of her school, she returned to her position in the senior class of Chautauqua Central School in April. She attended class in a wheelchair and by the most intense effort she completed her regular course of work and passed her regents examinations in French and mathematics with excellent grades. Her classmates accorded her the unprecedented honor of choosing her to be the graduation speaker of her own class.

Throughout the course of this experience, Sharon maintained a positive, sunny outlook even while realizing degree by degree the full extent of her disability. What is a shattering misfortune to contemplate by anyone in full health, in Sharon's case was turned into a period of most rapid social and emotional maturity with a newfound apprecia-

tion for her own academic and intellectual potential.

Vocational counselors at the institute, in the New York State Division of Vocational Rehabilitation and the guidance counselor in her high school all worked to locate colleges with physical arrangements that would permit her to attend classes in a wheelchair. At the time of her discharge from the institute, it was the opinion of her counselors that her disability was so great that a certain amount of seminursing aid care would be required in any residence college climate. The community committee who had formed in a spontaneous movement to help in any necessary ways was faced with the possible need to raise \$10,000 to subsidize two student attendants in a normal college period.

None of the guidance people were successful in locating a register of colleges who accepted students of this degree of disability, combining higher education with integrated services of rehabilitation specialists. The exception was the University of Illinois. Broadcast letters of inquiry to colleges and personal contacts of many interested people repeatedly resulted in references to the University of Illinois as the only university with special arrangements of the physical plant and a developed rehabilitation center an integral part of the university.

Correspondence, personal visits and talks established that here was a place that could offer not only a very broad range of educational and vocational possibilities, but could also offer an objective of independence in daily living and classroom life that heretofore had not seemed possible.

In the period of search by our one community, along with help from some of the most knowledgeable guidance and vocational counselors anywhere, the University of Illinois was the only institution we found in the United States that could offer this combination of educational and rehabilitation opportunities. I am now aware that starts have been made in other universities toward development of integrated re-

habilitation facilities.

When Sharon filed entrance application at the University of Illinois and when she was granted an interview, the cold facts of too many qualified applicants and too few vacancies raised doubts about her future. At that time, there were more than 400 applicants with a limit of new students of 40. Sharon was one of the lucky—she was accepted and is today struggling with the academic problems that face every freshman everywhere along with the physical problems of her particular disability.

Those of us who know Sharon have full faith in her eventual success in her final chosen lifework. She will not only achieve independent living, but will contribute her share to our national produc-

tion of goods and services.

What would have been her vacation had she been in the group of 9 of every 10 applicants who were not admitted? Would she have been a good subject to learn a trade or skill in a sheltered workshop? Would her intellectual and creative potential have been wasted away if she had sat at home, a dependent on her family, waiting for another year and another 1 in 10 chance of acceptance? These were questions that plagued her, her family and her advisers during the

period pending college acceptance of her application.

For me these experiences speak eloquently in behalf of extending and redoubling efforts to give opportunity to the disabled to achieve maximum degree of independent living. Through the period I have described I listened to successive reappraisals of the goals or objectives that this girl could achieve. These successive higher goals did not stem from changes in the level of physical ability, but rather, they became possible through the availability of facilities in Belgium, in New York City, her home in Chautauqua County, her school at Chautauqua and now at the University of Illinois.

I have grave doubts that these higher and higher goals would have materialized had there been long waits between availability of the

facilities.

In my opinion, H.R. 3465 is sound in objectives and reasonable and feasible in the forward steps it takes toward the independent living

goals for handicapped individuals.

I recommend to this subcommittee that it consider adding to section 302(b) a provision making approved university rehabilitation centers eligible for grants in a manner similar to that provided for nonprofit workshops. I realize that the present language of the bill perhaps does not exclude this type of grant under either section 302 or special projects grants under Public Law 565, but neither is it

specified or recognized as a necessary and desirable facility in achieving independent living possibilities for those physically handicapped but mentally fit for vocations requiring university training.

Reasons or arguments supporting this recommendation:

(1) The improvements of diagnostic and treatment facilities have made it possible for more disabled persons to be good candidates for college training. It is wrong to sponsor improvements in diagnosis, treatment and referral and to disregard the needs of facilities to carry out referrals involving higher education.

(2) This move by the Congress would be a most proper area for Federal action. It would be an act of recognition of the initiative and success of individual States and institutions who have pioneered

in this joint educational-rehabilitation service.

(3) The integration of rehabilitation and university facilities will stimulate interest and progress in research in vocational rehabilitation. Medical advances in the field of physical medicine have come from specialized rehabilitation centers integrated with medical schools. The integration of rehabilitation and academic institutions

will yield similar advancements in our knowledge.

(4) Lastly, in our "pursuit of excellence," in our concern for individual education and development, we should not neglect the intellectual and creative potential as well as physical and workshop skills and potentials of the handicapped. Were we to design a rehabilitation center for a young Franklin D. Roosevelt, had his illness been in his teens, would we not want him to attend a university? Would we be satisfied with a 1-in-10 chance of having space for him at a university?

Thank you very much.

Mr. Elliott. Thank you, Mr. Huhn, for that fine statement. Again I will call for Sylvia Golden. Is Sylvia Golden here? Horace Mann?

Tiorace Maini:

Bernard Frankel? Come forward, Mr. Frankel. Mr. Frankel, you may proceed with your statement.

STATEMENT OF BERNARD FRANKEL, EXECUTIVE DIRECTOR, LONG-ISLAND CONSULTATION CENTER, FOREST HILLS, N.Y.

Mr. Frankel. In my capacity as executive director of the Long Island Consultation Center of Forest Hills, N.Y., one of the large voluntary psychiatric outpatient clinics in the Nation, permit me to state what should be the six general objectives of any comprehensive program of rehabilitation.

These objectives and their implementation have relevance not only to rehabilitation in general, but also to specific handicapping conditions, whether they are physical, mental or both. They are as

follows

(1) Case finding; namely, the location of children and adults within a given geographic area who are in need of rehabilitation.

(2) Direct and anciliary treatment; namely, the correction of the handicapping condition to the extent possible and helping the handicapped person develop attitudes and skills essential to a more satisfying life.

(3) Community understanding; namely, to help the community to move toward a greater understanding and acceptance of the handicapped person's limitations and potentialities.

(4) Family understanding; namely, to help the families of handicapped people to understand and work within the limitations and

potentialities of the handicapped person.

(5) Professional recruitment and training; to promote and provide for the recruitment and training of specialists in professional fields related to rehabilitation.

(6) Research; to promote and stimulate research in methods of prevention, early discovery and care of handicapping conditions.

It is clear that these six objectives are interrelated if we can think of rehabilitation in the broad perspective. It is also clear that in the interest of developing local initiative, support, understanding and acceptance of a rehabilitation program, an extensive amount of community mobilization, planning and coordination is needed.

Obstacles in the way of necessary community planning and coordination, whether on the Federal, State, or local level, are primarily lack of funds; duplication on the part of voluntary health agencies in providing similar services for differing handicapping conditions under many different kinds of roofs despite a strong commonality of service needs; lack of agreement on what constitutes adequate rehabilitation standards and practices; gaps in continuity from hospital care to a return of the handicapped person in the community and family; self-centeredness in regard to advancing the interests of special health groups without due consideration of the relative importance of a specific health problem to the total health picture; the increasing barrage of special appeals for public financial support from many different groups which serve to make the public confused, uncertain, and isolated from a broad comprehension of rehabilitation priorities and needs; and finally, the overemphasis on physical, surgical, medical correctional practices in treating handicapped conditions with a consequent underemphasis of psychosocial and adjustive measures to help integrate the handicapped person as a member of his family and the community with the accompanying feelings of self-worth, adequacy, opportunity, and democratic participation in the world of education, recreation, vocational, social, and interpersonal oppor-

The obstacles I have mentioned are by no means inclusive.

Rehabilitation has become a term that can mean almost anything to anybody. In the minds of some, it may not go beyond braces or other orthopedic devices. In the minds of others, it may not go beyond physiotherapy, speech therapy or hearing aids or seeing-eye dogs. Still to others, it might mean sheltered workshops or special schools.

To my way of thinking, rehabilitation is a total comprehensive integrated approach to a handicapping condition, physical and/or mental, which provide multidisciplined and/or coordinated services designed to help the individual achieve as full a measure of independence, opportunity, growth and satisfaction as his condition permits, utilizing a maximum of diverse professional skills within a cooperative structure to help in developing the obvious and latent potentialities of the handicapped person.

Chairman Barden. That would not be so if it were not for the fact that about half of the people trying to work out a formula or a definition of the very thing you are now discussing—we resorted to

calling in some doctors; they did not harmonize.

I hope, with the privilege of filing a statement, you will see if you cannot trim down a statement that would be of assistance to the committee in arriving at a definite definition. Our trouble then was that if we left it open, virtually every interpreter would have a different definition, and if we use the word "shall" and said "It shall be," so and so, we would hardly get it printed before every member of the committee would be a sap, because everybody would find something else that belonged in that definition.

You know doctors, and I am not mad with them at all—I have a son that is a doctor and a son-in-law that is a doctor, so I can't afford to say anything about them, but there is a wide range of disagreement when you begin to try to define a term. I am sure you recognize

that fact in using it.

Mr. Frankel. Yes, and I certainly agree with you, sir. I feel that it is going to be very difficult to determine what an adequate program should be unless we do arrive at some definition, as long or as short as it might be, because until that point comes, we all will be talking about rehabilitation, but will all perhaps be meaning very different things by it.

Chairman Barden. For that reason, we have had to approach it rather cautiously, to keep out of that fog there. It was very clearly brought to your attention that it was existing. The doctors would not even agree on, for instance, the disability accompanying some par-

ticular disability that you would refer to.

As an aside from this, I remember very distinctly appointing a boy to Annapolis who was in the Bainbridge camp. He went to head-quarters and was examined by two doctors. They reported that he had hypertension, one eye was off, curvature of the spine, and one leg shorter than the other. When I got the report, I said to my secretary, "We better send an ambulance after him." The boy said there was not anything wrong with him. He said, "If I can get out of there, I will get along all right." I immediately applied for his release to go to school for preparation to enter the Academy. They granted that and about 4 months later he appeared at the Academy to enter. He entered as a perfect specimen of manhood, both legs the same length, no hypertension, eyes good, and the boy got along all right.

I should not say that in criticism of the doctors, but I relate it as an extreme example of how far they can get apart. That being so, I do wish you would very clearly define not the maximum, but the clear-cut understandable minimum in your definition. Is that asking too

 $\operatorname{much} ?$

Mr. Frankel. Responding to it spontaneously, I would like to boil down my definition of rehabilitation to include a comprehensive, integrated program of multidisciplined and coordinated services that are designed to help the handicapped person achieve as full a measure of life as possible.

Chairman Barden. Don't you think that would be a rather danger-

ous order to place in the hands of an administrator?

Mr. Frankel. I think it would, but I think an advisory committee

to such an administrator would be helpful.

Chairman Barden. Just after World War I, you would be surprised at the number on the pension rolls for ingrown toenails and flat feet. I am not at all fussing. I really want you to help us. I know what we are going to run into when we try to set the definition.

Mr. Frankel. In the latter part of my presentation, sir, I think I indicate some ways in which the Federal Government can enable national health agencies particularly to arrive at some workable definition of rehabilitation, which can then be translated into an integrated

kind of a program.

Chairman Barden. I know exactly what you are referring to. I was trying to just quietly get a little information that would be helpful.

Excuse the interruption.

Mr. Frankel. I think your interruption is appreciated by me, so I will not continue completing my definition because it is still on the long side. But I hope that the one I substitute for it nevertheless

makes just as valid a point, although somewhat shorter.

Let us attack the problem of meeting the needs of the handicapped by agreeing first on what we mean by rehabilitation, by arriving at some consensus of agreement wherein we are all talking in the same language and can assess what at least are the minimal standards for adequate rehabilitation programs.

Let us then, by survey, research and evaluation of current programs, put out fingers upon these gaps and shortages that undermine, prevent, or limit what we feel are the prerequisites for an adequate rehabilita-

tion program.

Speaking as a mental health clinician, let me state from my experience what I believe are the most critical unmet needs in rehabilitation in the field of disabling emotional and neurological handicaps.

Firstly, let me deal with the mentally ill, which has often been called America's No. 1 health problem. Public facilities for the mentally ill adult and child are nowhere near a comprehensive rehabilitation program. While the advent of drug therapy has in many instances shortened the period of hospitalization, there are still critical shortages of psychiatrists, psychologists, psychiatric social workers, psychiatric nurses, and attendants.

Psychotherapy, counseling and casework is primarily distributed on a sporadic and uneven basis. Most importantly, the link between hospital care and return to the community is very thin. This is most true in the areas of aftercare and regular followup, vocational training and placement, family preparation for the discharged patients,

and recreational opportunities.

For the mentally ill child, there are few residential treatment or specialized institutional facilities, few outpatient available clinical facilities, hardly any specialized public educational facilities for the child who lives at home, and few all-day integrated treatment and educational centers.

Next come the mentally retarded. Again one wonders about the high incidence of institutional placement because facilities are non-existent or inadequate for the child or adult who might be living at home, were it not for the absence of community facilities.

One wonders about institutional care and whether it is rehabilitative or preponderantly custodial in nature. In the community, there is a dearth of diagnostic and treatment facilities. There is a severe shortage of specialized educational facilities, trained teachers, and clinicians.

Recreational opportunities and sheltered workshops are sparse. Community attitudes of stigma even prevent adequate case finding. Speech therapists and remedial educational clinicians are few. There is a tremendous ignorance and a distorted hopelessness about the

potentialities of the retarded person.

Research is barely minimal. Education, guidance, and counseling of parents is generally forgotten. Parents of young children where retardation is suspected have had to wait 2 to 3 years before they could use the services of a diagnostic clinic.

Next come the neurologically disabled and the brain-injured children and adults. Again the same shortages of clinical facilities as well as educational, vocational, and recreational opportunities. Re-

search is at a most rudimentary level.

For the mentally ill, the retarded, and the brain injured, many doors are closed. National voluntary organizations that were formed to promote public awareness and to improve or create services for these handicapped groups grew out of the desperate needs of families and parents who joined together to combat community indifference and ignorance.

I could continue citing unmet needs and rehabilitation priorities in other areas of health where there are handicapping conditions. The handicapped, their parents and families, and the professionals who work with them, are aware for the most part of what is needed.

In my opinion, the Federal Government ought to broadly function on two main levels aside from specific and concrete legislative action to meet special needs of one handicapped group or another.

The first level should be that of an enabler. To bring together through conferences and meetings on a regular basis the national health agencies concerned with handicapping conditions, in order to arrive at accepted formulations and standards of adequate rehabilitation.

Secondly, through financial support on a demonstration basis possibly in partnership with foundations, State and municipal bodies, the Federal Government ought to underwrite programs of existing community councils on the local level, where the community council can provide a sound plan for comprehensive rehabilitation planning, involving the local health agencies, public and private in line with the six objectives mentioned previously.

In this way, local initiative, autonomy and eventual support will replace by community response the initial enabling function of the government. Avoidance of duplication, integrated effort, consensual agreement, cooperation and joint implementation can be best handled by existing planning and coordinating agencies on the local level.

Thank you very much.

Mr. Elliott. Thank you, Mr. Frankel.

At this point may I say that the full Committee on Education and Labor authorized our Subcommittee on Special Education to undertake early this past year, in the spring of this past year, a study that

we call our special education and rehabilitation study. That study

is under the direction of Dr. Merle Frampton.

The study group, at the same time we have been operating here, has been working on what it calls a New York study workshop. I would like to ask Dr. Frampton if the people from the workshop are ready to report and, if so, Dr. Frampton, you may present them.

are ready to report and, if so, Dr. Frampton, you may present them. Dr. Frampton. Yes, Mr. Chairman, your study group has been working for 2 days covering all the contents under the jurisdiction of this committee. There were in the sessions approximately 250 professionals from throughout the length and breadth of the State of New York. They formed themselves into eight major committees and elected their own chairmen and cochairmen. They are ready to report to your committee their findings.

They have been working hard, some of them burning midnight oil, and some of them may not even be here for the next half hour, because they are still at the reports. If some of the reports do not come in, we beg your indulgence and ask the privilege of inserting them in the record of this meeting, to be sent around to all of them. But I think maybe they will be here before the meeting has been com-

pleted.

The names of the chairmen and cochairmen you have before you, Mr. Chairman. If you will call on them as they appear, they will come forward and identify themselves. The committee should be very grateful, and I am sure you are, for this wonderful expression of their interest in their own professional fields. They have worked without any compensation, long hours, to bring before you the best thinking at the moment in this field.

Mr. Elliott. The Chair recognizes the gentleman from North Caro-

lina.

Chairman Barden. I wanted to say this in behalf of the whole committee which, as you probably know, consists of 30 Members of Congress: that the invitation in the State of New York was sent by Mr. Elliott, chairman of the subcommittee, and just as near a full and complete list of every group interested in this was sent out—and I think you sent out invitations to about 400.

Mr. Elliott. Several hundred. I do not have the exact number. Chairman Barden. I say that because sometimes when we attempt to enter a field, there is always somebody that says, "Well, they just have a pet group." We do not want a pet group. This committee, consisting of 30 members, would like to have the very best possible cross section of the best thinking of those who know the most about the subject.

Then we take that information and do the best we can with it. I thought that might be worthwhile as a word of explanation of the

activities of the committee.

Dr. Frampton. The first group, I believe, is the blind group on your list. They are ready to report.

Mr. LAFORE. Is this reporting by virtue of the eight categories?

Mr. Elliott. Yes.

The reporting is on the basis of the eight workshop groups, or the eight categories, maybe we should say. The first group to report is the section on the blind, which was chaired by Dr. Peter Salmon and

cochaired by Dr. Eber Palmer. Dr. Salmon is with us. Is this Dr. Palmer?

Dr. Salmon. Yes. I will be very brief, Mr. Chairman.

STATEMENTS OF DRS. PETER J. SALMON AND EBER L. PALMER, COCHAIRMEN, WORKSHOP ON SPECIAL EDUCATION OF THE BLIND

Dr. Salmon. We would like to have the committee hear the report of the invitees who sat in relation to the field of work for the blind at the

very kind invitation of your subcommittee.

We did have, and we have a list of those who attended, a complete respresentation, I think, of the various interests in work for the blind in New York State. We do not always agree with each other. As a matter of fact, I can remember in 1943 when the chairman of your committee, the full committee chairman, that is, did not have as much courage as he has today in getting work for the blind in one room. We just could not be in the same room at that time.

However, a lot has gone over the dam since then. We love to be in one room together. This report represents probably the closest thing to a concentration and a representation of the varying views of those who work with the blind and those who are workers for and those who

are workers of the blind.

The method or approach that we made was this: We stated the problem and then we discussed it, and then we made a proposal. We arrived at a consensus. That is what we would like to present to you

now. Thank you very much.

Dr. Palmer and myself as cochairmen worked together. We had . separate meetings the first meetings. The first day, October 27, was for special education, and the second day, October 28, was for rehabilitation. We completed this report at 2 o'clock this afternoon. We are very happy to present it to you.

Mr. Elliott. Dr. Salmon, let me ask you a question or two.

Do you mean the report that you bring us is the report that the entire group agreed upon?

Dr. Salmon. Yes, sir; positively. Mr. Elliott. Was it unanimous?

Dr. Salmon. We have stated we had a majority report on all items. In many items we had a unanimous report. Wherever there was a desire for a minority statement, we recorded that.

I think we have only two instances where persons wished to make a minority statement. But we invited minority statements on every single item. There is not one person that did not realize that.

Mr. Elliott. And apparently there were about 36 people in this

workshop group; is that right?

Dr. Salmon. It was a little more than that. I think there were probably closer to 60, taking the 2 days together.

Mr. Elliott. The gentleman from New York, Mr. Wainwright,

desires to ask you a question, Dr. Salmon.

Mr. Wainwright. Dr. Salmon, we have made reference to our full committee chairman's courage in what he did in the old days and what he does today in getting you people together. Do you have in here mention of the man who heads the group of the blind from California?

Dr. Salmon. Do you mean Mr. tenBrook?

Mr. Wainwright. Yes. Was he a representative?

Dr. Salmon. Mr. Taylor sat in as an observer, but he did not sit in as an invitee. He sat in and was very helpful in giving us information. Mr. Taylor did not vote on the various items and he did not sit in on all of the sessions.

Mr. Wainwright. Do not they represent a large segment?

Dr. Salmon. Yes. We invited and had the representative, Mrs. Mary Jane Hills, president-elect of the Empire State Association of the Blind, which is the affiliate of the National Federation of the Blind here in New York State. Our assignment, Mr. Wainwright, was to devote ourselves to problems of New York State that might have a Federal implication.

But where there was a national organization that had an interest, we invited them, and we did invite Mr. Taylor to sit in with us.

sat in for part of the meeting as an observer.

Mr. Wainwright. Mr. Taylor was the representative of that group?

Dr. Salmon. Yes, Mr. John Taylor.

Mr. Wainwright. We had hearings earlier this year by this same subcommittee, conducted by Mr. Elliott, and it was brought out at the time that a very large segment of the blind, and certainly one philosophy of care for the blind, was represented by Dr. ten Brook. I was interested in whether spokesmen for that philosophy were represented in this.

Dr. Salmon. Yes, they were, in the Empire Association for the

Blind of New York State, an affiliate.

Mr. Wainwright. But you said they did not vote? Dr. Salmon. The Empire affiliate did; yes, indeed.

Mr. Wainwright. Not Dr. Taylor? Dr. Salmon. No, because they have an affiliate, a chapter, here in New York State, which is an affiliate of the national federation, called the Empire Association for the Blind.

Mr. Wainwright. Those are very progressive steps, getting those

groups together.

Dr. Salmon. Yes. We were very happy and we appreciate their

cooperation very much.

Dr. Palmer is the cochairman and he will be able to read this more quickly than I can, because he went further in school than I did.

Dr. Palmer. I may be one of those who went further in school but

did not get as far.

As Dr. Salmon told you, we took up the problem and then the proposal. Incidentally, for your information, this was not necessarily a group of seeing people passing judgment upon what is best for those who are without sight, because we were very well represented in the group by those also who are without sight and who could express an opinion not only as a professional worker, but as individuals who had gone through this process of loss of vision or having no vision.

Therefore, it represents the consensus of those professional workers who see and also those who are without sight. I wanted to be sure

that you understood that it covered that.

There are a lot of problems and a lot of proposals. I am going to start reading and I will leave it to the discretion of the chairman to stop me whenever he feels that he wishes to.

Mr. Palmer. The section on special education of the blind herewith presents a summary of its deliberations in the meeting held on October 27, 1959. A list of those who attended is attached.

In the course of the discussion the question of the partially blind child was raised on occasion. The workshop group felt that since there was a section deliberating on the question of the visually handicapped child any matters relating to the visually handicapped should be referred to it.

The workshop on the blind referred to the workshop on the visually handicapped problem 1, proposal (a) below, in which it was felt that possibly some provision should be made for consideration of the visually handicapped group as well as the blind.

We are very pleased to report that on all proposals except No. 8, there was unanimous agreement, and on No. 8 there was substantial

majority agreement.

Problem 1: Statewide experience in the problem of securing teachers and the limited resources available for the training of teachers affects the soundness with which the community can deal with these

problems.

Even with a concentrated program such as that offered by the schools and some public and private agencies for the blind, the problem of securing teachers and of recommending educational resources for the training of teachers has been profound, and is even more marked in areas of the Nation where lesser services or no services are available.

In these areas geographic isolation and the small numbers of children involved make some kind of State and regional planning

essential.

PROPOSALS

(a) A highly qualified consultant and staff on the education of blind children should be added to the Department of Health, Education, and Welfare in the Office of Education, section for exceptional

children and youth;

(b) The amendment of Public Law 85–926 to include all types of exceptionality on a categorical basis would be highly desirable. The extension of this law to provide direct teacher training for teachers of blind children on an undergraduate or graduate level and administrators and teachers of teachers as well, is not only desirable, but highly essential.

If this creates any legislative problem, a new bill should be proposed

to accomplish this end.

Problem 2: Because of the severity of the handicap of blindness, it is recognized that effective and early case finding, diagnosis, educational counseling, family counseling, and other indicated community services are essential for the blind child and his family.

In order to create a climate within which the child can receive the affection and stimulation needed if he is to develop the potential with which he is endowed, the services of the various disciplines are needed over a long period of years in varying degrees of intensity.

There exists a nationwide shortage of trained professional workers

in all areas of service for the blind child.

In addition, the present curriculum in professional schools provides a generic approach to their professional disciplines. The specialized area of service to blind children and to their families requires curriculum and field experience in addition to generic training.

PROPOSALS

We suggest that:

(a) Specialized instruction and field services be made available in the handling of the problems of blindness, and that Federal funds in the form of grants-in-aid, including scholarships or fellowships be made available to professional schools to interest students in entering the field of service to blind children, and that financial assistance be granted to such schools to include the essential courses in their curriculums not currently offered.

It is also recommended that such grants, in addition to current support, be sufficient to carry the costs of field supervisory staff, selected for the purposes of student training by agencies for the blind having professionally qualified staffs in the various disciplines.

(b) Because of the geographic distribution of blind children and the comparative isolation of these children in many areas, the social caseworker or the child welfare or public assistance worker is frequently the only person providing any service to the family of a blind child.

It is, therefore, apparent that insofar as possible some national approach to the education of social workers should be attempted so that they will have the essential understanding of the problems of blindness.

Similarly, members of other professions may have heavy responsibilities in serving blind children. They, too, will need preparation in understanding the problems of blindness.

(c) In addition to the full curriculum the professional schools should receive Federal funds and encouragement to provide training seminars or intensive short-term training courses for practitioners.

(d) The professions include psychology, social work, educational counseling, speech therapy, and others concerned in the growth of blind children.

(e) These funds should be applied for training purposes over and

above what is currently offered.

Problem 3: We are fully aware that all of the national and local organizations concerned with the publication and distribution of books and equipment for the education of blind children have been struggling with the problem, which they have been unable to resolve.

Equality of education for blind and seeing children cannot be maintained without equality of books and equipment. Adequate books and equipment make the choice of educational opportunity possible to the parents of blind children. The blind child should not have to depend upon volunteer effort for its essential educational needs.

PROPOSALS

We would suggest that:

(a) The Library of Congress be empowered to purchase any or all needed books or devices from any reputable source, and to make such books and equipment available for educational purposes to blind children in public, private, and parochial schools.

(b) The American Printing House for the Blind be encouraged to expand its facilities and be permitted and encouraged to subcontract for the manufacture of finished products, either books, machines, or equipment, from any established and reputable source, and that its distribution quota be expanded to take care of all of the needs of each State without regard to the present money limitation of \$30 on a per capita basis in public, private, and parochial schools, and that the present authorization of \$400,000 be abandoned and an open end authorization be planned, at least during this period of emergency.

(c) Adequate funds be made available to the American Printing

House for the Blind for:

(1) The expansion of its administrative personnel to meet its own needs, which would include trained persons for area assignment to the States to expedite liaison between them and the printing house; and

(2) Federal funds be made available through the American Printing House for the Blind for the employment of personnel

to carry the program forward within the States.

This latter could be done either wholly by Federal funds or on a

Federal-State participating basis.

(d) Funds be made available to the Library of Congress to expand its proofreading program, accelerating the certification of proofreaders, increasing the payment to proofreaders, and liberalizing its application of proofreading regulations to include reimbursement for proofreading on a local basis to public and private agencies and to public, private, and parochial schools.

(e) Funds be made available for education and technological re-

search.

In this case, there was a minority point, and with your permission, I will read the minority point.

Chairman Barden. May I ask this question:

Does the minority viewpoint relate to all of the matter that you have read?

Mr. Palmer. Basically, no. That only deals with the matter of obtaining copyright permissions.

Mr. Daniels. Item No. 3? Mr. Palmer. That is right.

Minority viewpoint: In circumstances wherein Federal Government funds are currently appropriated to defray the expenses of reproducing copyrighted materials in Braille, suitable for use of blind persons, it is proposed that a system which affords the publisher holding the copyright a reasonable remuneration for the use of such materials, if such remuneration is required to secure permission to reproduce such material, be employed, and adequate funds be appropriated for this purpose.

Problem 4: The present high incidence of blindness among children has created a situation which is ideal for the study of the problems of the development of normal blind children, and even more particularly of the educational treatment and care of multihandicapped blind

children.

However, the pressure of meeting basic, rudimentary, educational needs has been so great that little study has been possible.

Such research in relation to blind children holds rich promise of its application to other types of handicapped children, particularly those children with congenital handicaps and organic brain damage.

In our group, we tried to keep specifically within our area of the

blind.

Enough evidence has been accumulated and enough special skill has been applied to the problem to indicate the need for intensive study during this period.

PROPOSALS

(a) We therefore suggest that consideration be given to the application of existing Federal laws making funds available for research

purposes, which might be applied to this problem.

In particular, Federal funds should be made available for the development of facilities which could carry out valuable research while providing services to render the multihandicapped blind child able to cope more effectively with his environment.

(b) The Department of Health, Education, and Welfare should encourage collaborative research on blind and and visually handicapped

children involving medical, social, technological factors.

Such research should be long term and the full cost should be

covered by grants-in-aid or by contracts.

Problem 5: The New York State study of services to blind children identifies a large number of children with severe impairments or other problems in addition to blindness. For many of these children the impairment is such that it prevents their benefiting from existing educational programs.

In view of this, there is urgent need for appropriate diagnostic and treatment facilities if their potential for education and for produc-

tive living is to be salvaged.

Unless appropriate services can soon be developed, this potential will have been destroyed and these children will become nonproductive and economically and physically dependent on governmental funds for their continued existence.

PROPOSALS

We suggest that:

(a) Diagnostic treatment centers be provided to serve States or regional needs.

It is recommended that these centers receive Federal support, both

for capital and operating expenses.

(b) Aside from the usual educational content of special education, the State and Federal Governments in cooperation should purchase services from qualified private agencies to provide services where existing public agencies cannot meet the need, and to make possible the inclusion of all aspects of rehabilitation necessary for the maximum functioning of the individual child.

(c) In order to deal effectively with the mental and emotional problems of blind children, Federal mental health funds should be made available for implementation of specialized programs of care, rehabilitation, and mental hygiene services for these children.

Such specialized funds might provide services either separately or in conjunction with specialized agencies equipped to provide effective

programs, not only in direct treatment, but in research.

Problem 6: The experience of the past 10 years of the enormously increased need for educational services for blind children has provided substantial evidence for the need of a broad supportive Federal program in the field of the education of blind children.

PROPOSALS

We would suggest that:

(a) A formula for substantial Federal participation in the extra costs of the special education of blind children needs to be explored.

(b) If a blind child is to secure adequate education and have an equal choice of educational opportunities with a seeing child, we would urge that vocational guidance and training be included in the structure of the education of blind children at the elementary and secondary school levels, and that Federal funds be made available through

grants-in-aid to implement this goal.

(c) The various offices of the Department of Health, Education, and Welfare, the Office of Education, Section for Exceptional Children and Youths, and the Office of Vocational Rehabilitation in particular, should be urged to take the leadership in this area and to apply their skills to the problem through the development of in-training seminars, guidance clinics, and courses specifically geared to the need of blind children in elementary and secondary schools.

Problem 7: It has been clear to the field of work for the blind and in the area of the education of the blind children, that the distribution of grants-in-aid for research and other programs needs special

review.

There is evidence that funds have not been applied to research and problems concerning blind children as has been the case with respect to other disabilities.

At present most grants require such rigid medical or university orientation as to make it impossible for work for the blind to take

advantage of these funds.

Moneys available through Public Law 482 or Public Law 565, become more and more difficult to secure and, in particular, funds under the National Defense and Education Act have been denied to schools for the blind and for the deaf for the furtherance of scientific and mathematical education.

PROPOSAL

Since there is greater need for Federal funds in research to be put into problems concerning blind children and need for the program to be further extended to include competent facilities in addition to university or medical settings, we propose that the Department of Health, Education, and Welfare be urged and encouraged to change its thinking and relax its attitude on the matter of providing grants for other than medical or university purposes, and that such funds as are available to be used on the basis of the merits of the application for the grant by the States and of the qualifications of the proposed research staff.

Problem 8: Apart from direct service needs of blind children, attention should be given to easing some of the major financial pressures borne by parents of these children by providing an amendment to the Internal Revenue Code to permit an extra tax exemption for the blind

dependent child. Parents of blind children face extra expenditures because of the blindness of the child which are not incurred in relation to the normal sighted child.

This added expense has already been recognized by the Internal

Revenue Code in relation to blind taxpayers.

PROPOSAL

We would, therefore, propose that the Internal Revenue Code be amended to achieve this end by creating an additional exemption for

the blind dependent of the taxpayer.

Problem 9: Despite the fact that reading matter for the blind, in either braille or on talking book records, may now be mailed directly to blind persons and from them to other sources of free charge, the limitation of 15 pounds of such materials is unrealistic in view of their extreme bulk.

PROPOSAL

We, therefore, suggest that an amendment to the present postal regulations be sought so that all educational material for the blind, regardless of weight, may be sent through the mails without charge.

This concludes the discussions in the report and proposals on the

first day of the workshop. That deals with education.

The second portion deals with rehabilitation.

Mr. Salmon. I hope he will be willing to hear the second section. We would appreciate it if you could. We have worked very hard to prepare this document.

Chairman Barden. I am certainly going to read it, because to me

this is a very valuable document.

Mr. Salmon. I might say the question was asked about the voting. We can give you, if the committee desires, the vote on each particular

item, if that is of any interest at all.

Mr. Wainwright. In my case, Dr. Salmon, all I was asking before was not to ascertain whether there had been any differences, or whether the differences had been settled, but more or less to get the concept that all views had been represented.

Mr. Salmon. I can only say that I have been working with this group for many, many years, and I don't think we have ever sat down and resolved more problems than we did in these 2 days.

I think it largely stems from the fact that the group appreciates very sincerely that here is a unique opportunity that has been offered to them by the committee to present problems and proposals.

Whether or not the committee in its ultimate judgment can accept some of these, or all of these, or any of them, we feel that this kind of situation has never existed before and we wanted to take full advantage of it.

I think that is why the group came to these conclusions.

Mr. Wainwright. Also, I wanted to make clear, particularly for Dr. Palmer after his opening statement, that I am not in the least in sympathy with the totalitarian viewpoint of this group, personally, that is, but I wanted to make sure that at least their views were represented.

Mr. Palmer. My supplementary remarks were merely to add to what Peter Salmon already said, that those who were present, the Empire State Association, the National Federation for the Blind, were not the only blind persons in attendance. There were others as well, who represented other areas.

Mr. Wainwright. But you touched right on the core of the diffi-

culty.

Chairman Barden. May I ask one question while we are on that?

Mr. Elliott. Mr. Barden.

Chairman BARDEN. In the past years when I was chairman, I remember handling two or three increases, and they were justified, for the American Printing House for the Blind. Is that not in Ten-

Mr. Salmon. It is in Kentucky, Louisville.

Chairman Barden. Yes, in Kentucky.

The last time or two the bill has been sponsored by a Kentuckian,

I do remember that.

You know more about the inside of that than I do. Could not an amendment to the act on the American Printing House for the Blind take care of this?

Mr. Salmon. That might. The real situation is that over the past 10 or 15 years there has been a great diversification of the educational processes, and there is an increasing need for individual textbooks,

one and two volumes at a time.

The American Printing House has been able to do a very excellent job with respect to the bulk printing. But these one and two text volumes become a great problem.

On Long Island, in Nassau and Suffolk Counties alone, we have 600 or 800 persons who devote themselves to brailling and transcrib-

ing individual books for blind persons.

Chairman Barden. The reason for the increase in the appropriations of the American Printing setup was the increase in cost of materials and the increase in cost of the labor and everything else that went into it.

Mr. Salmon. That is part of it; yes.

Chairman Barden. I was not fussing with them about that at all. But when we started to handle a major piece of legislation, every time we can put something like that somewhere where it will not bother,

it is better.

Mr. Salmon. We will be able to supply you with more detailed facts on the items as you study the items that become important. We felt that even though this is rather lengthy, that we should make it as concise as possible at this stage, and then if the committee is interested, we, all of us, the American Foundation for the Blind, I am sure the national federation, the printing house, and all of the group involved, will be glad to supply any and all informtion you might require.

Chairman BARDEN. By way of maybe a little sympathy for the chairman, I know he wants to hear every word of all of the reports,

but I doubt if the clock is going to move that slowly.

Do you have about eight?

Mr. Elliott. Yes, we have eight. Mr. Salmon. We will be glad to yield, Mr. Chairman. We appreciate the opportunity to present this to you. We know you will read

Chairman Barden. I cannot help but wonder why you had to be 20 years late.

Mr. Salmon. It takes a long time to get out of Brooklyn, you know.

Mr. PALMER. Or to New York from Batavia.

Mr. Salmon. And getting back is more difficult. Chairman BARDEN. I think it will be studied by all members of the

committee.

Mr. PALMER. May I say, Mr. Barden, there was no intent on the part of our particular workshop because of the fact that we read that part on education first, to indicate that we felt, although I happen to be in the educational field myself, that that is most important. We feel that they are equally important, but one had to come first.

Chairman Barden. Sometimes I wonder if I am in the educational

field of if it is on me.

Mr. Salmon. We feel they overlap.
Mr. Palmer. We appreciate very much your kindness.
Mr. Elliott. Thank you, gentlemen. It is a fine report and we will study it carefully. You have been very kind.

(The formal reports follow:)

REPORT OF WORKSHOP ON SPECIAL EDUCATION OF THE BLIND

Cochairmen: Dr. Peter J. Salmon, Dr. Eber L. Palmer

The section on special education of the blind herewith presents a summary of its deliberations in the meeting held on October 27, 1959. A list of those who

attended is attached.

In the course of the discussion the question of the partially sighted blind child was raised on occasion. The workshop group felt that since there was a section deliberating on the question of the visually handicapped child any matters relating the the visually handicapped should be referred to it. The workshop on the blind referred to the workshop on the visually handicapped problem 1, proposal (a) below, in which it was felt that possibly some provision should be made for consideration of the visually handicapped group as well as the blind.

We are pleased to report that on all proposals except No. 8 there was unanimous

agreement, and on No. 8 there was substantial majority agreement.

PROBLEM 1

Statewide experience in the problem of securing teachers and the limited resources available for the training of teachers affects the soundness with which the community can deal with these problems. Even with a concentrated program such as that offered by the schools and some public and private agencies for the blind, the problem of securing teachers and of recommending edu-cational resources for the training of teachers has been profound, and is even more marked in areas of the Nation where lesser services or no services are available. In these areas geographic isolation and the small numbers of children involved make some kind of State and regional planning essential.

PROPOSALS

(a) A highly qualified consultant and staff on the education of blind children should be added to the Department of Health, Education, and Welfare in the

Office of Education, Section for Exceptional Children and Youth.

(b) The amendment of Public Law 85–926 to include all types of exceptionality on a categorical basis would be highly desirable. The extension of this law to provide direct teacher training for teachers of blind children on an undergraduate or graduate level and administrators and teachers of teachers as well, is not only desirable but highly essential. If this creates any legislative problem, a new bill should be proposed to accomplish this end.

PROBLEM 2

Because of the severity of the handicap of blindness, it is recognized that effective and early case finding, diagnosis, educational counseling, family counseling, and other indicated community services are essential for the blind child and his family. In order to create a climate within which the child can receive the affection and stimulation needed if he is to develop the potential with which he is endowed, the services of the various disciplines are needed over a long period of years in varying degrees of intensity. There exists a nationwide shortage of trained professional workers in all areas of service for the blind child. In addition, the present curriculum in professional schools provides a generic approach to their professional disciplines. The specialized area of service to blind children and to their family requires curriculum and field experience in addition to generic training.

PROPOSALS

We would suggest that:

(a) Specialized instruction and field services be made available in the handling of the problems of blindness, and that Federal funds in the form of grantsin-aid, including scholarships or fellowships be made available to professional schools to interest students in entering the field of service to blind children, and that financial assistance be granted to such schools to include the essential courses in their curricula not currently offered. It is also recommended that such grants, in addition to current support, be sufficient to carry the costs of field supervisory staff, selected for the purpose of student training by agencies for the blind having professionally qualified staffs in the various disciplines.

(b) Because of the geographic distribution of blind children and the comparative isolation of these children in many areas, the social caseworker or the child welfare or public assistance worker is frequently the only person providing any service to the family of a blind child. It is therefore apparent that insofar as possible, some national approach to the education of social workers should be attempted so that they will have the essential understanding of the problems of blindness. Similarly, members of other professions may have heavy responsibilities in serving blind children. They, too, will need preparation in understanding the problems of blindness.

(e) In addition to the full curriculum the professional schools should receive Federal funds and encouragement to provide training seminars or intensive short-term training courses for practitioners.

(d) The professions include psychology, social work, educational counseling, speech therapy, and others concerned in the growth of blind children.

(e) These funds should be applied for training purposes over and above what is currently offered.

PROBLEM 3

We are fully aware that all of the national and local organizations concerned with the publication and distribution of books and equipment for the education of blind children have been struggling with the problem, which they have been unable to resolve. Equality of education for blind and seeing children cannot be maintained without equality of books and equipment. Adequate books and equipment make the choice of educational opportunity possible to the parents of blind children. The blind child should not have to depend upon volunteer effort for its essential educational needs.

PROPOSALS

We would suggest that:

(a) The Library of Congress be empowered to purchase any or all needed books or devices from any reputable source, and to make such books and equipment available for educational purposes to blind children in public, private, and parochial schools.

private agencies and to public, private, and parochial schools;

(e) Funds be made available for educational and technological research.

MINORITY VIEWPOINT

In circumstances wherein Federal Government funds are currently appropriated to defray the expenses of reproducing copyrighted materials in braille, suitable for use of blind persons, it is proposed that a system which affords the publisher holding the copyright a reasonable remuneration for the use of such materials, if such remuneration is required to secure permission to reproduce such material, be employed, and adequate funds be appropriated for this purpose.

PROBLEM 4

The present high incidence of blindness among children has created a situation which is ideal for the study of the problems of the development of normal blind children and even more particularly of the educational treatment and care of multihandicapped blind children. However, the pressure of meeting basic, rudimentary, educational needs has been so great that little study has been possible. Such research in relation to blind children holds rich promise of its application to other types of handicapped children, particularly those children with congenital handicaps and organic brain damage. Enough evidence has been accumulated and enough special skill has been applied to the problem to indicate the need for intensive study during this period.

PROPOSALS

(a) We, therefore, suggest that consideration be given to the application of existing Federal laws making funds available for research purposes which might be applied to this problem. In particular, Federal funds should be made available for the development of facilities which could carry out valuable research while providing services to render the multihandicapped blind child able to cope more effectively with his environment.

(b) The Department of Health, Education, and Welfare should encourage collaborative research on blind and visually handicapped children involving medical, social, technological factors. Such research should be long term and the

full cost should be covered by grants-in-aid or by contracts.

PROBLEM 5

The New York State study of services to blind children identifies a large number of children with severe impairments or other problems in addition to blindness. For many of these children the impairment is such that it prevents their benefiting from existing educational programs. In view of this, there is urgent need for appropriate diagnostic and treatment facilities if their potential for education and for productive living is to be salvaged. Unless appropriate services can soon be developed, this potential will have been destroyed and these children will become nonproductive and economically and physically dependent on governmental funds for their continued existence.

PROPOSALS

We would suggest that-

(a) Diagnostic and treatment centers be provided to serve State or regional needs. It is recommended that these centers receive Federal support both for capital and operating expenses. (b) Aside from the usual educational content of special education, the State and Federal Governments in cooperation should purchase services from qualified private agencies to provide services where existing public agencies cannot meet the need, and to make possible the inclusion of all aspects of rehabilitation

necessary for the maximum functioning of the individual child.

(c) In order to deal effectively with the mental and emotional problems of blind children, Federal mental health funds should be made available for implementation of specialized programs of care, rehabilitation, and mental hygiene services for these children. Such specialized funds might provide services either separately or in conjunction with specialized agencies equipped to provide effective programs, not only in direct treatment but in research.

PROBLEM 6

The experience of the past 10 years of the enormously increased need for educational services for blind children has provided substantial evidence for the need of a broad supportive Federal program in the field for the education of blind children.

PROPOSALS

We would suggest that:

(a) A formula for substantial Federal participation in the extra costs of the

special education of blind children needs to be explored.

(b) If a blind child is to secure adequate education and have an equal choice of educational opportunities with a seeing child, we would urge that vocational guidance and training be included in the structure of the education of blind children at the elementary and secondary school levels, and that Federal funds be made available through grants-in-aid to implement this goal.

(c) The various offices of the Department of Health, Education, and Welfare—the Office of Education, Section for Exceptional Children and Youth, and the Office of Vocational Rehabilitation in particular, should be urged to take the leadership in this area and to apply their skills to the problem through the development of intraining seminars, guidance clinics, and courses specifically geared to the need of blind children in elementary and secondary schools.

PROBLEM 7

It has been clear to the field of work for the blind and in the area of the education of blind children that the distribution of grants-in-aid for research and other programs needs special review. There is evidence that funds have not been applied to research and problems concerning blind children as has been the case with respect to other disabilities. At present most grants require such rigid medical or university orientation as to make it impossible for work for the blind to take advantage of these funds. Moneys available through Public Law 482 or Public Law 565 become more and more difficult to secure, and in particular, funds under the National Defense and Education Act have been denied to schools for the blind and for the deaf for the furtherance of scientific and mathematical education.

PROPOSAL

Since there is greater need for Federal funds in research to be put into problems concerning blind children and need for the program to be further extended to include competent facilities in addition to university or medical settings, we propose that the Department of Health, Education, and Welfare be urged and encouraged to change its thinking and relax its attitude on the matter of providing grants for other than medical or university purposes, and that such funds as are available to be used on the basis of the merits of the application for the grant by the States and of the qualifications of the proposed research staff.

PROBLEM 8

Apart from direct service needs of blind children, attention should be given to easing some of the major financial pressures borne by parents of these children by providing an amendment to the Internal Revenue Code to permit an extra tax exemption for the blind dependent child. Parents of blind children face extra expenditures because of the blindness of the child which are not incurred in relation to the normal-sighted child. This added expense has

already been recognized by the Internal Revenue Code in relation to blind taxpayers.

PROPOSAL

We would therefore propose that the Internal Revenue Code be amended to achieve this end by creating an additional exemption for the blind dependent of the taxpayer.

PROBLEM 9

Despite the fact that reading matter for the blind, either in braille or ontalking book records, may now be mailed directly to blind persons and from them to other sources free of charge, the limitation of 15 pounds of such materials is unrealistic in view of their extreme bulk.

PROPOSAL.

We therefore suggest that an amendment to the present postal regulations be sought so that all educational material for the blind, regardless of weight. may be sent through the mails without charge.

THOSE WHO ATTENDED WORKSHOP FOR THE BLIND ON TUESDAY, OCTOBER 27, 1959

Dr. Peter J. Salmon, executive director, cochairman, the Industrial Home for the Blind.

Dr. Eber L. Palmer, superintendent, cochairman, New York State School for the Blind.

Herbert R. Brown, director, Vocational Rehabilitation Service for the Blind, Department of Social Welfare.

Peter DeVasto, president, Parents of Blind Children Association, Brooklyn-Queens.

Mrs. Mary K. DeWitt, managing director, Blind Work Association, Inc.

Sr. M. Floretta, O. P. superintendent, Lavelle School for the Blind.

Sr. Jean Marie, O. P., Lavelle School for the Blind.

Anthony Cimino, New York State School for the Blind.

Oscar Friedensohn, New York State Commission for the Blind.

Dr. Milton D. Graham, director, bureau of research and statistics, American Foundation for the Blind.

Mrs. Mary Jane Hills, Empire State Association of the Blind.

George E. Keane, assistant executive director, the Industrial Home for the Blind.

Mrs. Elizabeth R. Locke, executive secretary, Syracuse Association of Workers for the Blind.

Charles McAllister, New York State Department of Mental Hygiene.

Miss M. Anne McGuire, director, New York State Commission for the Blind. Miss Elizabeth Maloney, director of educational and social services, the Industrial Home for the Blind.

Miss Myra Morgan, president, Alumnae Association, New York State School for the Blind.

Mrs. Irene Rappaport, child psychologist, New York Association for the Blind. Paul M. Ruhland, in care of New York State School for the Blind.

Dr. Herbert Rusalem, director of personnel service, Hunter College.

Miss Marian L. McVeigh, Office of Vocational Rehabilitation, Department of Health, Education and Welfare.

Paul C. Mitchell, New York Institute for the Education of the Blind.

Miss Sara Neufeld, Associated Blind, Inc.

Maurice D. Olsen, American Association of Instructors of the Blind.

Edward Ruch, Catholic Guild for the Blind, Diocese of Brooklyn.

Paul Sauerland, Catholic Guild for the Blind, New York diocese.

Irvin Schloss, legislative analyst, American Foundation for the Blind. Dr. Dwight C. Smith, general secretary, John Milton Society.

Harry J. Spar, director of services, the Industrial Home for the Blind.

Fred R. Starcke, Parents of Blind Children of Long Island.

Mrs. Ada Kozier, Director of Children's Services, New York Guild for the Jewish Blind. Miss Eleanor Walsh, assistant director, Bureau of Public Assistance, New York

State Department of Social Welfare. Rev. Alfred J. Weinlich, director, Catholic Guild for the Blind, Diocese of

Brooklyn.

REPORT OF WORKSHOP ON REHABILITATION OF THE BLIND

Cochairmen: Dr. Peter J. Salmon, Dr. Eber L. Palmer

This report of the workshop on rehabilitation of the blind is presented to the Subcommittee on Special Education of the Committee on Education and Labor of the U.S. House of Representatives with considerable enthusiasm because of the fact that the group which deliberated on the matters contained in the report represented usually divergent opinions and interests in the field of work for the blind in New York State, and in addition, there were representatives from some of the national agencies in this field. Their enthusiasm reflects itself in the fact that there was a consensus on all points contained in the report by actual vote.

RE TITLE X OF THE SOCIAL SECURITY ACT

Problem 1

Condition of unemployable blind persons:

As the handicap of blindness is very frequently increased by factors of advanced age, poor health, secondary disabilities, and work background and aptitudes which cannot effectively be used without sight, many blind persons are unemployable and a major portion of these unemployable blind persons find that living with public assistance is a permanent way of life. In view of this, the subsistence provided by public assistance is inadequate to support wholesome morale in these blind recipients and, consequently, results in unhappiness for the recipients and deterioration of the social setting in which they live.

Under the present law, welfare agencies, as well as friends and relatives, who have no legal responsibility for these blind persons but who may be interested in ameliorating their condition are prevented from offering any regular financial assistance by the fact that any such assistance is nullified by a

offsetting reduction in the public assistance grant.

Proposal

Title X of the Social Security Act should be amended to mandate the exclusion of a stipulated amount of income from any source—not restricted to earned income—in computing the resources of blind recipients of public assistance.

Problem 2

Condition of blind persons with marginal employability:

Blind recipients of public assistance who are capable of partial self-support are denied an adequate incentive to help themselves, as no portion of their earnings, beyond the meager limit of \$50 per month, can be used to improve their severely depressed standard of living under the present law. They are denied the values accrued from work, as the satisfaction that work can afford lies largely, for most underprivileged persons, in the tangible rewards of work. This condition tends to perpetuate the frustration of being unable to rise above a subsistence level of living. It produces a defeatism and loss of dignity for the blind persons involved which diminishes their abilities to contribute to the economic and social health of the communities in which they live.

Those blind persons who have been self-supporting prior to having to resort to public assistance and who have some potential for regaining self-support find that the rewards of their thrift and hard work are nullified by the requirement that they exhaust or assign all of their real estate holdings and their life insurance. This requirement tends to delay the acceptance of public assistance by impoverished blind persons who undermine their own health and deteriorate the social climate of the communities in which they live by their delay. It also, together with the prohibition against saving by recipients of public assistance, often imposes unsurmountable barriers to the reestablishment of self-support by blind recipients of public assistance.

Proposals

Title X of the Social Security Act should be amended to mandate that-

(a) one-half of the earned income of blind recipients of public assistance be excluded in computing their financial resources;

(b) a stipulated amount of life insurance and real estate, up to a stipulated assessed evaluation, serving as a domicile for blind recipients of public assistance be excluded in computing their resources;

(c) blind recipients of public assistance be permitted to retain in escrow earnings and other income in excess of the exempt resources proposed above

for use in the purchase of a business or in entering upon any occupation which may hold promise of providing them with a means of self-support.

Problem 3

Inadequate appreciation of the needs and potentialities of blind recipients of public assistance: Administrators of public assistance who are unable to devote an adequate portion of their time to studying the special needs and potentialities of blind persons fail to appreciate the difference between the unique conditions which affect blind recipients of public assistance and those which prevail for recipients of public assistance who are not blind and which form the basis upon which public assistance programs are developed and administered. This situation has resulted, generally, in the evaluation, on both the Federal and State levels, of public assistance administered to the blind by standard criteria of costs and results and, inevitably, such an evaluation fails to reveal the true condition of blind recipients of public assistance or to suggest the measures that are so desperately needed to alleviate their condition.

Proposals

It is suggested-

(a) that title X of the Social Security Act should be amended to provide at least one full-time consultant on services to the blind in the public assistance office of the U.S. Department of Health, Education, and Welfare;

(b) that the Bureau of Public Assistance should regularly collect and publish detailed statistics on recipients of aid to the blind.

Problem A

Need for increased Federal participation in public assistance for the blind: The increased costs that will be entailed in the proposed improvements in public assistance to the blind may be difficult for the States to absorb in their entirety. We feel that such increased costs, therefore, should be shared by the Federal and State Governments.

Proposal

Title X of the Social Security Act should be amended to provide a revised formula which will increase the per capita grant from the Federal Government to the States for public assistance to the blind.

RE TITLE II OF THE SOCIAL SECURITY ACT

Problem 5

Economic disadvantage of employed blind persons: The necessity of selecting a place of residence convenient to public transportation, the necessity of employing safe transportation facilities, the necessity of patronizing those stores that provide maximum assistance in purchasing, the necessity of employing painting and other property maintenance services, and a great many other conditions serve to impose an extraordinary burden of major consequence upon the financial resources of blind persons. This means that any blind person requires significantly greater financial resources than his seeing peer to maintain a given standard of living. In addition, with very few exceptions, a blind person's earning power is substantially lower than it would be if he could see or than it was before he became blind. Aside, therefore, from the relatively few fortunate blind persons who are able to earn a substantial income, any blind person in our society suffers a major economic disadvantage which tends to deny a basic sense of security. For these reasons and because the disability provisions of the old-age and survivors insurance section of the Social Security Act have related benefits to rehabilitation, to substantial gainful employment, to arbitrary age 50, and to a minimum definition of blindness, amendments are needed to resolve this sense of insecurity and to clarify the eligibility requirements for disability benefits under the act.

MINORITY VIEWPOINT

Mrs. Florence Starr wished to be recorded as being in disagreement with the problem as stated, although she was in favor of the proposal, because she believes that the problem as stated is not professionally based.

Proposals

Title II of the Social Security Act should be amended to provide-

(a) benefits as an absolute right regardless of age, income, or employment status, related exclusively to the establishment of the disability of blindness within the following definition: "Central visual acuity of 20/200 or less in the better eye with correcting lenses, or visual acuity greater than 20/200 if accompanied by a limitation in the fields of vision such that the widest diameter of the visual field subtends an angle no greater than twenty degrees."

(b) that the present requirement of coverage of 20 quarters of the last 40

quarters be reduced to no more than 1 quarter of coverage;

(c) that the present provision of compulsory acceptance of rehabilitation be abandoned, but that instead the OASI be encouraged to suggest rehabilitation to all beneficiaries.

Problem 6

Blind persons who earned coverage after onset of blindness: The field of work for the blind is aware of a very real problem concerned with blind persons who have been employed in covered industry during the course of their blindness and who have earned benefits which under the present law will not become available to them. We are also aware that a revision of the law which would make benefits available to such employed blind persons might, during the first period in which the law becomes effective, create a request from a relatively large number of blind persons for benefits hitherto not available to them. It is our belief, however, that in the overall plan of insurance benefits concerned with disability such a temporary increase in the numbers of those eligible for benefits would be negligible, and as a matter of human justice and for the welfare of the community as a whole, we propose:

Proposal

Title II of the Social Security Act should be amended to make disability insurance benefits available to persons who have earned coverage since the onset of the disability of blindness.

RE PUBLIC LAW 565

Problem 7

Condition of unemployable blind presons: Many blind persons who are unemployable impose an unnecessarily heavy burden on the time and energies of the individuals most directly concerned in their welfare because of the extremely limited opportunity available to such persons to receive training in skills of self-care.

Proposal

Public Law 565 should be amended to give the U.S. Department of Health, Education, and Welfare responsibility for providing rehabilitation appraisal and training services, through the appropriate State agencies, to blind persons who may be incapable of delevoping ability to engage in remunerative employment but who may show good potential for achieving, through proper training, ability to meet the requirements of basic independent living and to contribute to the maintenance of a wholesome, social, and emotional atmosphere in the setting in which they live.

Adequate legislation should be provided to assure the meeting of the recognized needs of independent living for a large group of our population, and the Department of Health, Education, and Welfare be charged with responsibility for so integrating its services that this result will be accomplished, and particularly, that the problems of the blind be given consideration so that they might through appropriate services gain the ability to achieve the highest level

of independent living possible.

Problem 8

Inadequate understanding on the part of rehabilitation personnel who do not specialize in services to the blind of the special problems which result from blindness and the techniques of helping to meet these problems: The fact that blind persons comprise only a small portion of the handicapped persons served under Public Law 565 makes it impossible for administrative personnel re-

sponsible for the operation of the total Federal-State rehabilitation program to devote sufficient time to the special needs of blind persons to become adequately familiar with the best means of meeting their needs and helping them achieve their optimum potentialities.

Proposal

The U.S. Office of Vocational Rehabilitation should strengthen its services to the blind, and assign one full-time consultant on services to the blind to each of its regional offices.

Problem 9

Insufficient use and development of existing specialized services for the blind: The inability under present law of State rehabilitation agencies to delegate responsibility for rehabilitation counseling, placement, and certain other services results in an uneconomic duplication of public and private services and in an inability of State rehabilitation agencies to provide services in geographic areas in which private specialized services for the blind are nonexistent.

Proposal

Public Law 565 should be amended to permit State rehabilitation agencies for the blind to purchase any or all services on a per-case basis from agencies or other resources which operate programs that meet standards established by the State agencies and which will submit to case audits by the State agencies with the understanding that (1) failure on the part of an agency or resource to meet the standards established by the rehabilitation agency for the blind in its State will disqualify such agency or resource as a resource from which the State agency may purchase service; and (2) failure to follow procedures in any case for the providing, recording, and reporting of services will make the agency ineligible to receive payment for the services rendered in the case. visions would reduce the demands upon the State agencies for the providing of direct service in geographic areas where qualified agencies or other resources operate, would assure the rendering of unduplicated competent rehabilitation services to blind persons in the State, and would continue the opportunity of the agency or other resource to demonstrate and initiate, at its own expense, new or different techniques and procedures in serving blind persons.

MINORITY VIEWPOINT

Mrs. Mary Jane Hills: "It is our contention that placement and counseling should remain the responsibility of the Vocational Rehabilitation Service."

Problem 10

Insufficient availability of professional and technical personnel qualified to serve blind persons: Teaching grants to colleges and universities and trainseeships for students are currently contributing to the preparation of rehabilitation counselors, specialists in physical medicine rehabilitation, and certain other professional personnel required to staff the expanding rehabilitation services throughout the United States. However, the support currently provided for the training of rehabilitation personnel is generally unavailable for the training in services to the blind of many professional and technical specialists important to the conduct of competent rehabilitation programs for blind persons, and the general lack of familiarity with specialized services for the blind on the part of college and university teaching personnel imposes severe limitations on the extent and quality of training which colleges and universities can provide in the field of service to the blind.

Proposal

Public Law 565 should be amended to provide (a) scholarships and fellowships for persons qualified in the various professional and technical specialties that operate in the field of service to the blind in order that such persons—psychologists, teachers, occupational therapists, etc., might receive the type of orientation and training that will equip them to practice their respective specialties in serving blind persons; and (b) field training grants to public and private agencies operating competent rehabilitation programs for the blind to be used to provide, in cooperation with appropriate teaching institutions, orientation and training to qualified professional and technical specialists whose services are needed in the rehabilitation of blind persons.

RE PUBLIC LAW 732 AS AMENDED

Problem 11

The Randolph-Sheppard law was originally set up as a means of providing one of the most meaningful opportunities for the employment of blind persons, and over the years has accomplished a great deal toward this end. However, during this time there has been increasing evidence of the encroachment of vending machines in buildings where the vending stand was or could be made adequate to provide for the occupants of the building. It is felt that pressures have been brought to bear on the officials in charge of the building resulting in making it difficult for blind persons to have the opportunities which Congress intended. There is no desire, however, on the part of those working with the blind to insist on stands being set up where a cafeteria is clearly indicated. The device of utilizing vending machines has in some instances been employed in order to divert income to purposes other than those authorized in the act.

Proposal

Public Law 732 should be amended so as to preclude the income from vending machines accruing to any group or purpose other than to the blind. Further, the installation of such vending machines should be limited to areas which are not feasible for vending stands. Provision should be made within the appropriate Federal agency to appeal from departmental decisions contradictory to the purposes and intent of the law.

RE HILL-BURTON ACT

Problem 12

Inadequate facilities for the providing of needed rehabilitation and special education services for blind persons.

Proposal

The Hill-Burton Act should be broadened to provide facilities and equipment, beyond those operated under medical auspices, essential to rehabilitation or special education programs for the blind—such as diagnostic and treatment centers for blind children and youth, rehabilitation centers for blind adults, special workshops for blind persons, nursing homes and special residences for aging and otherwise incapacitated blind persons, etc.

RE LIBRARY OF CONGRESS ACT

Problem 13

Inadequacy of existing facilities for the distribution of books and materials for blind persons. There exists a need for research in order to discover more adequate ways of improving books, materials, machines, and other devices for the use of the blind and to establish adequate means for their distribution.

Proposal

The Library of Congress Act should be expanded to provide funds to build and operate libraries and other facilities, or to support existing libraries or other facilities for the distribution and repair of books and special materials for blind persons, and to undertake to encourage technological research for the improvement of existing machines or other devices or the development of new devices.

RE CIVIL SERVICE ACT

Problem 14

Many blind persons are denied a fair opportunity to obtain employment under civil service because of preconceptions held by some Government personnel concerning the disabling effects of blindness.

Proposal

The Civil Service Act should be amended to provide that (a) no person otherwise eligible should be denied the right to compete in a civil service examination or to hold civil service employment on the basis of blindness alone; and (b) any blind person who may have reason to believe that he is barred from a particular civil service examination or a particular civil service position on the basis of his blindness alone may file an appeal and receive the benefit of arbitration of his claim of discrimination by an impartial board appointed by an appropriate officer in the Civil Service Commission and may have the option of being represented before this board by a rehabilitation specialist approved by the Division of Services for the Blind of the U.S. Office of Vocational Rehabilitation or by a person of his own choosing at the discretion of the aggrieved blind person.

RE INTERNAL REVENUE CODE, SECTION CONCERNED WITH EXEMPTION FROM PAYMENT
OF EXCISE TAXES

Problem 15

Burden placed on financial resources of nonprofit philanthropic agencies by their payment of excise taxes: The service programs of nonprofit philanthropic agencies are operated with the support of private voluntary contributions and/or Government support. The payment of excise taxes by such agencies tends to defeat both the purpose of the deduction from personal income of contributions to charitable organizations permitted in the payment of income taxes and the purpose of Government payments for the support of such organizations. The payment of excise taxes by nonprofit philanthropic agencies entails an expenditure for them of considerable proportions which has the effect of diminishing their capacity to serve their clients.

Proposal

The section concerned with the exemption from payment of excise taxes under the Internal Revenue Code, section 501(c)(3), should be broadened to exempt all agencies for the blind now or hereafter recognized and exempted as non-profit charitable organizations.

RE RESEARCH

Problem 16

It is currently recognized that a minimum of research effort is being applied to the field of the rehabilitation of blind persons, and that in the past adequate funds have not been available to promote such research. Now that funds are available under Public Law 565 and other Federal laws, not a sufficient percentage of such funds is being spent in the areas of problems arising out of blindness. It is hoped that research applied in this field might have application throughout the whole area of rehabilitation.

Proposal

The U.S. Department of Health, Education, and Welfare should encourage collaborative research on the problems of blind adults involving medical, social and technological factors. Such research should be long term and full costs should be covered by grants-in-aid or by contracts.

THOSE WHO ATTENDED WORKSHIP REHABILITATION OF THE BLIND, OCTOBER 28, 1959

Dr. Peter J. Salmon, executive director, cochairman, the Industrial Home for the Blind.

Dr. Eber L. Palmer, superintendent, cochairman, New York State School for the

Mr. Charles R. Wallendorf, director, Special Services School, Vocational Education and Extension Board, Nassau County.

Miss Eleanor Walsh, New York State Department of Social Welfare.

Mr. Elliott. Our next report is that of the group for the emotionally disturbed. It is headed by Dr. Dave Salten, chairman, and Dr. Philip Wexler, cochairman.

Will Dr. Salten and Dr. Wexler please come forward.

STATEMENT OF DAVE SALTEN, COCHAIRMAN, WORKSHOP ON EMOTIONALLY DISTURBED

Mr. Salten. Dr. Wexler had to return to Albany. He expresses

Mr. Elliott. You may proceed, Dr. Salten. We are anxious to

hear your recommendations.

Will you tell us were they reasonably unanimous? Did your workshop group reach the conclusions you are going to present to us in a reasonably unanimous fashion as was true with the blind?

Mr. Salten. The decision was entirely unanimous, Mr. Chairman.

There was no minority report included.

Mr. Elliott. You may proceed, Dr. Salten. Mr. Salten. During the last 2 days, Mr. Chairman, a workshop of 25 experts from the fields of psychiatry, psychology, social work, special education, and vocational rehabilitation have met under the chairmanship of Mr. Philip Wexler and myself, to deal with the problem of education for the emotionally disturbed.

The specific recommendations of that group will be made available

in several days.

I ask now, Mr. Chairman, for permission to submit that report to the committee within a few days.

Mr. Elliott. I believe we said previously that the record would be open for 10 days. Is that sufficient?

Mr. Salten. That is entirely sufficient.

Mr. Elliott. You may proceed with that understanding. Mr. Salten. I ask now for 2 or 3 minutes to add to that report a short oral statement which, in our judgment, expresses the concensus of the meeting of the past 2 days.

All of us felt that it was a matter of national policy to use in the most productive fashion the talents and capabilities of all the people of this Nation, the exceptional and handicapped as well as the normal. We felt that how America deals with its exceptional children is a prime indicator of its philosophy concerning individual human dignity and the welfare of our Nation.

We recognize how generous the Congress has been for many years in providing for national assistance to handicapped children and adults through the various statutes which make possible the Children's Bureau, the Office of Education, the Office of Vocational Re-

habilitation, and the National Institutes of Health.

What we ask for today, Mr. Chairman, is a plea, a plea to the Congress, to include the emotionally disturbed children among the categories of the handicapped. We feel that the inclusion of this group in the categories of the handicapped, therefore making them available for various types of assistance now possible under the law, will be a great step forward in realizing the potential of all our citizens.

Our committee finds that the emotionally handicapped children of this Nation comprise the single largest group of exceptional pupils

in our educational system.

We find also that extreme shortages exist in every area of specialization, teachers of the emotionally disturbed, psychologists, school social workers, and so on, and that on the national level, there is a manpower shortage in the educational field generally, but locally even where manpower is potentially available, training facilities are insuf-

ficient to meet the demand.

We find also that a great need for coordination exists at all levels, as evidenced by the fact that educators and mental health specialists are still going through a period of trial and error in determining the best means of meeting the needs of the emotionally handicapped, and although various Federal and State agencies have given financial support to different projects, it is vital that all experimental programs be properly evaluated.

We recommend, therefore, the creation of a commission under Federal auspices to study interrelationships between education and emotional disorders, such commission to undertake the evaluation of such

pressing problems as:

(1) Criteria for definition of emotionally handicapped children in

terms of their children;

(2) the extent of such emotionally handicapped conditions among

children of school age;

(3) an estimate of the loss due to emotional handicaps, and a survey of remedial measures within the schools as well as treatment facilities outside the schools which now serve emotionally disturbed children.

In its evaluation, this commission would cooperate with Federal and State agencies looking toward such economies as might be effected through the elimination of duplicated services, with this commission acting as a clearinghouse for the dissemination of information and research related to the area it has studied.

It would evaluate remedial measures, in some cases through support of private projects, encourage, facilitate and support such research as indicated and undertake whatever steps the commission would find necessary in order to alleviate this national problem and to make recommendations as to its solution.

Mr. Chairman, that completes the report of our group on the emo-

tionally disturbed.

Mr. Elliott. Thank you very much.

Chairman Barden. The first thing I want to mention is, do not give all your thanks to Congress in providing these things. The thanks belong to the good people of America whose tax money pays for it.

We try to distribute it wisely, and sometimes I think we are pretty heavyhanded in the distribution. But in the final analysis, it is the people; and a lot of them are sitting in this room—their money went

into whatever good we have done.

We were just privileged to associate ourselves with the program. There is one thing that I would like for you to do in filing your statement. That is, provide the best possible definition of what you

mean by "emotionally disturbed."

I taught school at one time, and at one time it was very difficult for me to tell whether my students were emotionally disturbed, or whether it was myself. I would like that to be in very definite terms for the assistance of the committee.

Mr. Salten. May I respond to that?

Chairman Barden. Yes, sir.

Mr. Salten. I want to thank you, Mr. Barden, for your very gracious remarks concerning American taxpayers. But the committee did want me to express the fact that we felt the committees of the Congress had been not simply generous, but farsighted in their provision of needed funds for this important segment of our population.

Concerning the matter of definition, Mr. Barden, I say that the question of definition and incidence concerned the committee during the first 6 hours of its deliberation, and we decided at that point to move

on to other matters.

It is recognized that in the case of the blind, the deaf, the orthopedically handicapped, and the like, the problem of definition is relatively simple.

Chairman Barden. I just have to comment that passing the buck is

not a new custom.

Mr. Salten. We shall not pass the buck to the Congress, Mr. Barden. We hope to provide some information which will enable the members of your committee to give us some genuine assistance.

Chairman Barden. It is important because I have been through that before, and you educated people just give me more trouble with these big combinations of words; but you never give me much light on the detailed definition. That is why I have been two or three times suggesting that when the term is used, the definition is terrifically important.

Thank you. I apologize for interrupting you, but if you will put

that into the record, I, for one, will appreciate it.

Mr. Salten. We will attempt to do that with the greatest clarity possible.

. Mr. Elliott. Thank you, Doctor.

Mr. SALTEN. Thank you.

(The material referred to follows:)

REPORT OF SUBCOMMITTEE ON SPECIAL EDUCATION OF THE EMOTIONALLY DISTURBED. Hunter College, October 27-28, 1959

Cochairmen: Dr. David G. Salten, superintendent of schools, Long Beach, N.Y., Dr. Philip Wexler, department of mental hygiene, Albany, N.Y.

PREFACE

With the presentation of these findings, will be a number of recommendations dealing specifically with the unmet needs of a substantial proportion of the Nation's population presently categorized as subgroups of the exceptional. Each of the workshop committees will point up needs for additional personnel, research, and services.

In many instances, these needs as stated by the many subgroups will seem similar; however, in the area of the emotionally disturbed, much must be accomplished in order to achieve even parity with many of the other handicaps.

The stigma attached to emotional disabilities in the past has effectively limited the organization and growth of large active groups such as those operating on behalf of many of the other handicaps. This in part explains the phenomena that Federal legislation and the financial aid derived therefrom for the emotionally disturbed has admittedly lagged behind similar legislation in other areas of the handicapped.

Statistically, the emotionally handicapped children comprise the single largest group of exceptional pupils in our educational systems. This fact might indicate the need for some revolutionary changes in Federal legislation to meet the needs of this large handicapped group. In actuality, the findings of the workshop on the emotionally disturbed and the proposals we feel are merely evolutionary to the level of acceptance of all other handicaps.

I. THE PROBLEM OF THE DEFINITION OF THE EMOTIONALLY DISTURBED

Most handicaps which are readily defined are the result of a defect easily recognizable to the eye or to existing measurement techniques, either physically. intellectually, or neurologically.

(a) General definitions

A general definition of the emotionally disturbed may be one that merely describes the individual as one lacking good mental health. The term "good mental health" is diffuse in meaning but generally applies to:

(1) Adequate personal strength to meet the trials and tribulations of living with responses that are acceptable to the social mores of the community at large.

(2) A knowledge and appreciation of limitations equally balanced by a satisfying and productive use of capacities.

who live in a chronic state of poor mental health.

(3) Social adjustment that does not bring conflict with peers or authority. If these be acceptable, then the emotionally disturbed can be said to be those

(b) Proposed definition for use in determining Federal legislation

The Dictionary of Education, second edition, McGraw-Hill, 1959, defines the "handicapped child," as "a child whose physical, mental, emotional, educational. or social condition places him at a disadvantage in comparison with normal children."

It then describes "the emotionally maladjusted child" as "(1) a child whose behavior is so different that he cannot participate in normal activities with other children; (2) a child who cannot benefit from the school situation because of deep psychological problems that bring about deviant behavior and resistance to learning, development, and growth.'

It still further describes "the emotionally disturbed child" as one "with a deep-rooted problem who habitually expresses his feeling in a deviant manner."

This definition could be augmented by five characteristics of the emotionally disturbed child as cited by Dr. Eli M. Bauer, State Department of Education, Sacramento, Calif., who has done research in this field:

"(1) An inability to learn which cannot be explained by intellectual, sensory,

or health factor.

"(2) An inability to build or maintain satisfactory interpersonal relationships with peers or teachers (adults).

"(3) The appropriate types of behavior or feelings under normal conditions.

"(4) A general pervasive mood of unhappiness or depression.

"(5) A tendency to develop illnesses, pains, or fears associated with personal or school problems."

In general, an emotionally disturbed child is one whose mental health processes are impaired, preventing him from gaining from or maintaining himself in school or life settings.

II. UNMET NEEDS

- (1) Perhaps the greatest unmet need in terms of Federal legislation is the recognition of this type of handicap and its existence. There are, under the four major Federal bureaus dealing with the handicapped (Office of Vocational Rehabilitation, Children's Bureau, Office of Education, and National Institutes of Health), legislative actions that could aid in helping meet the needs of this type of child. The implication that these acts are to include this type of handicap can be accomplished by a highlighting of its existence by this congressional committee.
- (2) Shortages exist in every area of specialization; teachers of emotionally disturbed, psychological staff, social workers, and all of the other professional disciplines involved in meeting the needs of those emotionally disturbed children (rehabilitation, nursing, etc.).

(3) Training facilities and training grants are insufficient if not nearly non-existent to meet the ever-growing demand for specialists in the area of the

emotionally disturbed.

(4) A need for coordination exists at all levels as evidenced by the fact that educators and mental health specialists are still going through a necessary period of trial and error in determining the best means of meeting the needs of the emotionally handicapped; and, although various Federal and State agencies have given financial support to different projects, it is vital that all experimental programs be properly evaluated.

(5) There is a need for a comprehensive survey and evaluation of present educational and remedial measures within the schools, as well as treatment facilities outside the schools, which now serve emotionally disturbed children.

III. PROPOSALS

- (1) Under the extension and improvement section of Public Law 565, grants-in-aid to provide rehabilitation facilities are set up and should be expanded to include moneys and programs for the emotionally disturbed. This could be accomplished by setting up within the Office of Vocational Rehabilitation structure consultative positions to assist the States and local communities in planning such services.
- (2) Under the Children's Bureau Act, grants-in-aid to States are provided for services for maternal and child health services which include counseling and clinical services for both parents and children defined as retarded. These grants-in-aid should be expanded to include the emotionally disturbed child and make available the establishment of large clinics in urban areas and traveling clinics for rural areas.

(3) Public Law 482, the Medical Facilities Service and Construction Act, provides for construction of rehabilitation centers and facilities and should be expanded in definition to include the emotionally disturbed (handicapped).

- (4) The research training grant program of the National Institutes of Health (Mental Health and Neurological Disease) provides funds for fellowships, scholarships, and research grants which could be expanded to include programs for the emotionally disturbed.
- (5) The cooperative research program of the Office of Education should be allocated additional funds to include plans for programs for the emotionally disturbed.
- (6) Under the titles of the Social Security Act an interdisciplinary approach representing health, education, and welfare should be established as a referral unit in disseminating information to all public and private:
 - (a) Health organizations;
 - (b) Social welfare agencies:
 - (c) Schools;
 - (d) Clinics:

as a means of developing an awareness in these agencies of the necessity for

early identification and evaluation of emotional disturbance.

(7) The staffs of the Office of Vocational Rehabilitation, National Institutes of Health, Office of Education, and Children's Bureau should be expanded with specialists in the area of emotionally disturbed to render field consultation services throughout the country.

(8) Provisions should be made for strengthening of the interagency approach which is inherent in the coordinated workings of the units of the Department of Health, Education, and Welfare to establish joint research projects and training grants to meet the needs regarding limited personnel.

(9) Federal acts and organizations that affect aid to the handicapped should be studied with an eye to expanding facilities and training of personnel for all disciplines involved in working with the emotionally disturbed.

IV. CONCLUSION

The expending of funds to fulfill or even partially fulfill the requirements under the few proposals as listed herein will in actuality result in a savings of the tax dollar in the future through proper inclusion of the emotionally disturbed under all of the existing Federal legislation and recommended procedures. The savings will be readily evidenced by the number of individuals who could through proper services and good mental hygiene approach be not only maintained in their communities, but also become contributing members to the society in which they live.

ATTENDANCE SHEET, WORKSHOP IN SPECIAL EDUCATION AND REHABILITATION

Emotionally disturbed

Dr. David G. Salten, Dr. Philip Wexler, cochairmen

Herbert F. Johnson, superintendent of schools.

Kenneth M. Wilson, superintendent of schools.

Anthony S. DeSimone, assistant regional representative, Office of Vocational Rehabilitation.

Joseph Palevsky, Counselor, Office of Vocational Rehabilitation.

Bernard Schwartzberg, administrative director.

Margaret Lawrence, Rockland City Mental Health Board.

Dr. George M. Krupp, child psychiatrist.

Dr. M. H. Fouracre, head, department of special education.

Katherine D'Evelyn, director of psychological service.

Fern Charlton, supervisor of special education.

Dr. Mary Alice White, director, psychology department.

Barnet Rabinow, program director.

Ruth Schwartz, psychiatric social worker, Nassau Center, emotionally disturbed. Dr. Laurette Bender, principal resident scientist, New York State Department of Mental Hygiene.

Dr. Carl Fenichel, director, League School.

Dr. Morris Krugman, assistant superintendent in charge, educational and vocational guidance.

Dr. Jean Thompson, Bureau of Child Guidance, Board of Education, New York City.

Dr. Gilbert Trachtman, research coordinator, Long Beach Schools.

Dr. Milton Kaufman, Director, Nassau Center, emotionally disturbed. Dr. Harry Gilbert, Board of Examiners, Board of Education, New York City.

Dr. Herbert Turkel, New York University.

Dr. Victor B. Elkin, director of psychological services, Long Beach Schools.

Dr. Albert J. Harris, director, education clinic and program of education.

Bernard Soper, director psychiatric services, New York State Department of Mental Hygiene.

Dr. E. Goldsmith, vice president, Nassau Center, emotionally disturbed. Dr. E. R. Clardy, director, child guidance, Rockland State Hospital.

Rev. David G. Farley, assistant superintendent, diocese of R.V.C. Charles Wallendorf, vocational education and extension board.

Mr. Elliott. Our next workshop group dealt with the problems of the gifted, and that group was headed by Mrs. Coutant, and the cochairman was Dr. Meister.

Mrs. Coutant. May I introduce Dr. Gardner, representing the New York State Teachers Association.

STATEMENT OF MRS. M. COUTANT, COCHAIRMAN, WORKSHOP ON THE GIFTED

Mrs. Coutant. In your hands you have our little document that is the work from sweat and tears for the last 2 days. As Dr. Framton very properly stated, we did work into the late hours and we apologize for lack of finish.

I would like to talk to you in terms of what I see as highlights that are probably of the most interest to you. First of all, you are concerned as representatives of the people, naturally, with what the people think. The first thing I would like to say to you, and I think we have evidence to support it, is that there is a rapidly growing concern for the education of the gifted. There can be shown by the number of requests flooding our offices.

By offices, I mean the New York State Teachers Association, the State education department, the liaison, which I happen to be, for the

American Association for Gifted Children.

We cannot keep up with the requests that come into us.

I would like you to know also that the community pressure is ahead of the administrators, many times, and I hope they don't take offense at it, but it is true that the public is pushing us, the parents and groups and the children themselves.

I can go on endlessly with quotes from the children, about it is exciting to learn that through learning is fun. They are delighted

to go on.

So the community pressure, the demands of the students, and the requests coming in, plus the fact that 80,000 teachers believe essentially what we are telling you today, I think is good evidence.

You asked the other testifiers about the unanimity of the workshop we have just finished. I can say that they were really completely unanimous in their approval of the needs that we have suggested to you here.

This means a little more when I tell you that the workshop was made up of representatives from all parts of the State geographi-

cally.

We took nine viewpoints. We took world life, urban life, elementary, secondary, and higher education, teaching, guidance, administration, and research, and we took all of these angles and then integrated them.

We were amazed to find the unanimity of opinion when we got the recommendations together. We want to thank you for including the gifted in the concern of your subcommittee. We are very happy to be considered by you.

As we look at the whole problem of the gifted, I think it is important to see that we are dealing essentially with individual differences, and the rest of these people here have a little older history in this than we do. It goes back to the insane in England, when they used to have them in cages for the entertainment of the public on Sundays, and they would go out and tantalize these people in order to entertain themselves.

Now as we see it, all of these gaps are being filled by the people who are interested in the blind, the physically handicapped, and we rather latecomers are concerned about these youngsters who have real

special abilities.

Rather than being 20 years late, Mr. Barden, I feel that our problem has been, among the people who came to this workshop, at least, that they may have been at least as much as 20 years ahead. It has been very hard to interpret this message to the public and bring them along with the leaders in the field.

We want to say essentially that the legislation you already have seems phenomenally good to us. We are most appreciative of the National Defense Education Act and the National Science Academy.

If you did nothing more than aid and abet the lines which you are already following, I feel that we in the gifted would be very happy with it. You have precedents for most of our recommendations, and you will see others, because we are not experts at legislation, by analogy, which will come from the rise of vocational education, by following the Smith-Hughes Act through the various George-Barden Acts, and so forth, and the services to agriculture. By analogy, I am sure you will come up with more ways that you could serve these gifted children than we could possibly devise.

We want to applaud the fact that you are having a workshop, as our representatives from the blind have already told you. If this does not influence your legislation in the least, the interplay among us was most valuable and we will consider the 2 days a terrific

privilege.

We came up with our great needs. Need No. 1, as everyone else is telling you, is trained personnel. I cannot emphasize this too much. You will find that it is the first in our list, from what the people said.

The learning is the heart of the school, and learning varies with the teacher. Investment in teachers of quality can never be a mistake.

That is the first point.

Second was research. We simply do not know what we are doing in many instances, and we will not know unless we devise much more

adequate research than we now have.

Third, we need suitably challenging programs for these youngsters. Once they become accustomed to challenged programs, they are no longer satisfied with what we have been giving them in the way of school fare in the past.

The fourth and last of our imperative needs, I will not bore you with many other little needs, is administrative structure. We do need help through established channels and expansion of channels

that you already have.

The recommendations you will see on your papers that we have devised to explain, we hope that they might help you in solving the case.

However, we now enter your territory where you know best how to make the legislation. All I can say is that general legislation that can be interpreted to provide opportunities for gifted is probably preferable to our group than specific legislation aimed at the gifted.

We would rather have your legislation broad in vision so that we can interpret it to our needs, and then let the local and State divisions

define or give the definitions and define the programs developed

within this broad outline that you devise.

We have said very little about costs, as you can see, because we really don't know much about it. We have figured out in our experimental programs that if we can get at a per capita cost for any program that we have, we can compare this with the per capita cost of something else, anything in New York State.

For instance, our average central school has \$927 per student, and if we can divide that by months we come up with \$92.70 per month for

10 months.

Consequently, any program we devise, if it runs around \$90 a month, we feel we are within what the public is used to paying. So we do it in that wav.

If we get more than that, we say perhaps we can still continue,

but we want to economize a little.

In conclusion, we want to make available to you a collection of the most valuable documents that we have for your study and your committee's study. We want you to know that we are all glad to appear any time, and, as you can tell from me, at any length, at

your request.

The most important thing perhaps I have heard about the gifted in the many years I have been at it is that gifted children can return to us more than we can possibly give to them. Their handicaps lie within us who are not so gifted, and guilty of adult delinquency. Please keep them in mind as you provide for all children.

Thank you very much.

Mr. ELLIOTT. Thank you very much, Mrs. Coutant. That was a very fine report. Does that complete the report?

Mrs. COUTANT. This is all we would like to say orally. We would like to have you read, of course, and we would love to have questions, if you have the time.

Mr. Elliott. It is 10 minutes until 4 o'clock and we have five other groups to hear. So I think if I can urge my fellow committee mem-

bers to forgo the questions, we will pass to the next group.

Thank you, Mrs. Coutant.

(The formal statement submitted by Mrs. Coutant follows:)

SPECIAL EDUCATION AND REHABILITATION STUDY, NEW YORK STATE WORKSHOP ON THE GIFTED, OCTOBER 27 AND 28, 1959, HUNTER COLLEGE, NEW YORK

Chairman: Madeleine F. Coutant, coordinator of programs for the gifted, director of the summer and winter program of advanced studies, elected representative of this workshop to report to the subcommittee hearings, October 29, 1959, board of cooperative educational services, first supervisory district, Oneida County

Cochairman: Morris Meister, president, Bronx Community College

It was with a general feeling of strong concern over the needs of the gifted children in our schools that the members of this workshop gathered to discuss these needs and what could be done to meet them. We are increasingly aware that children differ from each other and children with special abilities or "gifts" have special needs. We are now very concerned with developing our human resources as well as our natural ones. Our society, our Nation, is beginning to recognize its dependence upon the gifted in our society to assure its growth, security, and the care of its less fortunate members.

Because of this concern top professional educators came gladly to the workshop at their own expense from all parts of the State and almost every type and level of education to work together for 2 full days to determine what the needs of our gifted are and how these needs could be met in a practical way. We know that in all the Federal and State legislation now affecting education there are few legal provisions that specifically allocate responsibility and funds for the education of the gifted. We approached the problem from nine viewpoints: rural life and urban life; elementary and secondary schools and higher education; teaching, guidance, administration, and research.

We found almost complete agreement on the needs of the gifted and on the belief that the Federal Government has a share in the responsibility for ful-

filling these needs.

This morning, Dr. Cyril Wilcock, another representative of the workshop, described the past and present accomplishments in New York State. It is surely a fine record but we still have a number of urgent needs. Some of them you have already recognized and provided for in the National Defense Education Act: loans to students in institutions of higher education, a program for the identification and encouragement of able students, equipment, and supplies for science, mathematics, and foreign languages. We want you to know that the education profession appreciates the great strides made already through this act. We are watching results with great interest and wish to encourage you to expand your efforts through further legislation along similar lines.

The most imperative needs as seen by this workshop are four as listed below and accompanied by the recommendations which would meet these needs.

Need No. 1: Professional personnel, teachers, administrators, psychologists, curriculum specialists, counselors, and other professional personnel who know how to discover the special abilities of children and how to teach these children to do their best and make the most of their abilities. There is a shortage of teachers in general and specially of those with successful experience in handling gifted children.

We believe three ways to help solve this situation are—

(a) To provide ways for the teachers of gifted children to grow in gen-

eral knowledge and in their special fields.

(1) Recommend Federal support for teacher education programs established in sufficient numbers in humanities, social studies, and the arts as an extension of the plan of the National Science Foundation in mathematics, science, and foreign languages. These programs should include both summer institutes and full year institutes and summer schools for gifted students that also serve as demonstration schools in which teachers can observe and participate.

(II) Recommend that a program be established to reimburse outstanding teachers to enable them to return to a university campus

for 1 year to improve their command of their specialty.

(b) To recruit more and better students for special training as teachers of the gifted especially for the elementary schools.

(I) Recommend Federal grants-in-aid for the college preparation

of educators for the gifted.

(c) To and specially trained personnel for new kinds of services, including consulation, coordination, educational research. We have reached the stage in education where we need specialists to augment the classroom teachers as medical specialists augment its services of the general physician and diagnostician.

(I) Recommend that Federal funds be used to supplement local funds for the salaries of specialists in the education of the gifted as has been done for teachers of agriculture and home economics.

Need No. 2: Research to evaluate procedures already developed and to develop

better ones: qualified personnel to conduct the research.

(I) Recommend a generous portion of all funds allocated for the gifted be unrestricted funds devoted to research in the area of the gifted; that the provisions of the legislation be modeled after the very efficient cooperative research program of the U.S. Office of Education which does not require matching funds either by State or local communities. Another essentially similar program which could serve as a model in title VII of the National Defense Education Act.

(II) Recommend that research funds be available for definitive evaluation of projects already in existence and well established as well as for new

experimental program.

(III) Recommended a program of grants, scholarships, and fellowships to be set up to recruit and train personnel in the field of educational research

and to provide training facilities for the program.

(IV) Recommended the strengthening of existing facilities whereby small communities can obtain consultation and supervision of educational research through their State department of education or nearby colleges and universities.

(V) Recommend that direct grants be made available to colleges and universities to facilitate and strengthen research in the area of the gifted. Need No. 3: Programs to serve the gifted. Money and effort are increasingly directed to the discovery of gifted children at as early an age as possible but the programs for serving the children once they are selected are equally important. There is great need to develop appropriate courses and challenging activities.

(I) Recommend that the Federal Government supply grants for the experimental school initiation programs designed to serve the needs of the

gifted

- (II) Recommend the extension of the National Defense Education Act provisions for identification of able students to the pupils of the elementary
- (III) Recommend the continuation of the National Science Foundation research participation programs and the establishment of other similar national agencies for all the culturally productive arts so all potentially able students may begin to associate at an early age with professionally trained workers.

Need No. 4: Administrative structure to meet the needs of the rapid increase in the number of persons and projects involved in the education of gifted children.

(1) Recommend the expansion of the offices and facilities of the U.S. Office

of Education.

(a) To include a clearinghouse to receive and disseminate information about programs for the gifted to both professional and lay groups—a pooling of resources of the Federal, State, and local levels.

(b) To assume a strong leadership role in the field of the gifted.

(c) To publish small inexpensive pamphlets that interpret to the public the importance of educating the gifted and making appropriate provisions for them.

(II) Recommend that the Federal Government match State funds in setting up local and regional offices of coordination for programs for the gifted to include sufficient staffing with coordinators, researchers, psychologists, etc.

COSTS

Most of the attention to the problems of the gifted has begun only in recent years. It is such a new field that we have not accumulated much experience with costs. Also due to the lack of communication among experimenters we have not been able to profit by the experience of others. Consequently, it is difficult for us to arrive at estimates of the costs of our various recommendations. In our own situations, we are using various methods. Probably, most schools tailor their programs to whatever amount of money is available. When the amount of money is not a limiting factor as in the case of special grants an effort is made to stay somewhere near comparable per capita costs. This means in New York State that we keep in mind the State aid per pupil, for example, about 927 in the small central schools including State aid of \$412 for high school students and \$330 for elementary pupils. For highly specialized services for the gifted, we may use \$700 per pupil for severely retarded children as a yardstick. Dividing the average amount by 10, we get a cost per month of \$92.70. In this way we judge the cost of \$91.75 per student for a 2-month summer school of advanced studies as being extremely reasonable as in one experience we have had in Oneida County.

On a national scale you might use this per capita cost and multiply it by the number of gifted children. Of the 36 million children in the country, we feel that 15 percent can be classified as gifted and talented, the percent changing according to the particular definition of "gifted," and the criteria for selection in any particular project. This type of calculation would indicate that approximately \$50 million would provide a complete 2 month special summer instruction annually for every gifted student. Of course, projects that require only a few

hours of instruction each day or week during the winter session can be prorated accordingly.

CONCLUSION

We appreciate fully the measures you have already enacted and we urge that you keep in mind the needs of the gifted and talented children as you view the needs of all children, expand the present good legislation and create new legislation as it seems possible and desirable.

Mr. Elliott. The next group is the one that studied mental retardation.

Dr. Ignacy Goldberg, I believe, will present the findings of that group, and perhaps will be accompanied by Prof. Chris DeProspo of that group.

STATEMENT OF IGNACY GOLDBERG, COCHAIRMAN, WORKSHOP ON MENTAL RETARDATION

Mr. Goldberg. The group considering the mentally retarded consisted of 28 individuals, representing colleges and universities, public schools, government agencies, private organizations, and we also had in our group a number of graduate students from Teachers College, Columbia University, the Special Education Department, who are the recipients of scholarships and fellowships under Public Law 85–926.

The group classified the unmet needs in the area of the mentally

retarded under three broad categories:

(1) Identification, evaluation, and health problems;

(2) Special services and programs; and

(3) Research and personnel.

Under identification, evaluation, and health, in an attempt to develop the broadest community approach to the early identification of the mentally retarded, the group recognized the necessity for promoting early identification of all exceptional children.

We feel that this can be best accomplished by developing an aware-

ness of this need on the part of the following agencies:

(1) Private and public health organizations;
(2) Public and private social welfare agencies; and

(3) Public and private schools.

The group recommends the establishment under title V of the Social Security Act of a referral unit within each State with a staff representing health, education, and welfare, who shall have the responsibility for establishing and maintaining continuous contact with all organizations in the above fields in order to—

(1) Alert organizations to the problems of the mentally

retarded:

(2) To establish a central file of referral cases;

(3) To disseminate this information to proper agencies for following up with due regard to protecting identity of individuals. The group recommends allocation of funds under title V of the

The group recommends allocation of funds under title V of the Social Security Act to the Children's Bureau, for expansion of present mentally retardation clinics, to include the increase in number of such clinics.

Two, development of traveling clinics in sparsely populated areas. Three, allocation of funds for training of visiting health personnel to be attached to the clinics who would have the responsibility for assisting parents in home care and training of the children.

Under the grouping "Special services and problems," as unmet needs, the group states that funds under maternal and child health services and the crippled children services, are intended, as we understood, by the Federal Government to be used for the mentally retarded as well as other individuals with handicaps.

A problem was brought up that frequently the State agency receiving and administrating such a fund is not charged by the State

with the responsibility for the mentally retarded.

For example, the State health department receives and administers funds; however, the department of mental hygiene might be the responsible State agency for the program for the retarded, except for education of the retarded.

Therefore, the group proposes that all State plans, regardless of which State agency administers the funds, should be required to include a plan for the use of the funds for the mentally retarded as well

as others.

Another proposal is that more Federal funds be made available under provision of the extension and improvement sections of Public Law 565, whether State surveys show the need for more sheltered workshops or rehabilitation facilities.

These funds should be tied into needs and available State and private funds within the States and not according to the formula by

population.

Another proposal is: The Federal Government has spent millions of dollars to help establish sheltered workshops and rehabilitation facilities. These services have proved their value in terms of persons rehabilitated, resulting in savings to taxpayers by maintaining them in the communities.

The problem is that the Federal grants are limited as to time, and there is a great danger that these services will be curtailed or cease

to exist when the grants expire.

Therefore, the group proposes that the House committee highlight the desirability that the States provide regular grants-in-aid for the continuing operation of the workshops or rehabilitation facilities which have met desirable standards.

The Office of Vocational Rehabilitation should be provided with funds to set up consultant positions to assist the States and com-

munities in planning such services.

Another proposal: The concept of rehabilitation facilities in the independent living bill should be expanded to include a center which would help individuals to learn to care for themselves as much as possible, to utilize their innate capacities to a maximum degree so as to require a minimum of help from the other members of the family in daily living, and to be brought together for social and occupation activities in meaningful use for their days.

The last group of unmet needs comes under research and education. The group agrees that research should be carried out within the framework of the four Federal agencies now having the major responsi-

bility for special education and rehabilitation programs.

These four agencies are: (1) The Office of Education, (2) the Office of Vocational Rehabilitation, (3) the National Institute of Mental Health, and (4) the Children's Bureau.

The group would like to go on record to commend the Congress for its interest in legislation and in the appropriation of funds by means of which a program has been begun in research and personnel training in the area of mental retardation. The studies completed and in progress indicate the complexity of the problem and the need for additional research of a comprehensive and long-range nature to amplify and follow through on the present findings which have served as a framework for future productivity investigations.

Research in other areas of mental retardation is also needed to form a complete picture of the problem at the various chronological and

mental age levels.

The group considered recommendations under the various Government agencies: First, under the Office of Education, support of research should be broadened to include investigation of many complex problems of mental retardation. For example, there is a need for funds to support the development of new diagnostic instruments.

Second, research is needed in the area of long-range studies in learn-

ing processes of mentally retarded, et cetera.

A single comprehensive study was mentioned as an example to point out the interrelationships among the following factors:

(a) The location of the mentally retarded at the preschool

level.

(b) Changes in intellectual status during the school years; and (c) Absorption of the mentally retarded adult into the com-

munity.

Under the Office of Vocational Rehabilitation, the group felt that research in rehabilitation at an international level should be brought to the attention of American professional workers. Staffs should be strengthened to achieve these ends in order to coordinate, assimilate, and interpret these studies. The group agreed that the utilization of knowledge of international developments in special education should be an important aspect of all provisions for exceptional children and adults.

There is also a need to implement the findings of existing studies concerned with the factors involved in the educational adjustments of

the mentally retarded.

Another recommendation was made that funds be provided for additional training of vocational rehabilitation counselors in the problems of mental retardation, and additional in-service training institutes be sponsored for this purpose.

As far as the National Institute of Mental Health is concerned, the group recognized that research in mental retardation cuts across many

biological and sociological distances.

For example, it was recommended that sociological and psychiatric workers' studies be studied, particularly in the behavior sciences, to include investigation into family, community, and environmental effects on the mentally retarded.

Another recommendation was that personnel trainingship should be extended in areas auxiliary to education and rehabilitation of the mentally retarded in order to encourage trainees to undertake studies

of special problems and needs in mental retardation.

Finally, some of the general recommendations were that there is a need to strengthen the interagency committee on mental retardation

on the Federal level, to coordinate the work of the units within the Department of Health, Education, and Welfare. For example, it was recommended that the services of the Office of Education and the Office of Vocational Rehabilitation be coordinated in order to facilitate the handling of certain needs of the mentally retarded in areas of education and rehabilitation, these needs being too extensive to be met by either agency alone. Demonstration of vocational and educational projects of a joint nature were suggested, as were demonstrations of comprehensive community centers for vocational training.

Thank you.

Mr. ELLIOTT. If there is any part of your statement that you did not read, be sure and give it to the reporter for the record.

Mr. Goldberg. Thank you, sir.

(Report submitted by Mr. Goldberg follows:)

MENTAL RETARDATION

Cochairmen: Chris J. De Prospo and Ignacy Goldberg

I. IDENTIFICATION, EVALUATION, AND HEALTH

In an attempt to develop the broadest community approach to the early identification of the mentally retarded, we recognize the necessity for promoting early identification of all exceptional children. We feel that this can be best accomplished by developing an awareness of this need on the part of the following agencies:

(1) Medicine (private and public), health organizations.

(2) Public and private social welfare agencies.

(3) Public and private schools.

We recommend the establishment under title 5 of the Social Security Act of a referral unit within each State with an interdisciplinary staff (representing health, education, and welfare) who shall have the responsibility for establishing and maintaining continuous contact with all organizations in the above fields in order to—

alert organizations to the problems;

(2) establish a central file of referred cases; and

(3) disseminate this information to proper agency for following up with due regard to protecting identity of individuals.

We recommend allocation of funds under title 5 of the Social Security Act to Children's Bureau for expansion of present mental retardation clinics:

(1) Increase in number of such clinics.

(2) Development of traveling clinics in sparsely populated areas.

(3) Allocation of funds for training of visiting health personnel to be attached to the clinics who would have the responsibility for assisting parents in home care and training of the children.

II. SPECIAL SERVICES AND PROGRAMS

Statement

Funds under maternal and child health services and the crippled children services are intended by the Federal Government to be used for the mentally retarded as well as other handicaps.

Problem

Frequently the State agency receiving and administering the funds is not charged by the State with the responsibility for the mentally retarded. For example, the New York State Health Department receives and administers funds; it claims that the department of mental hygiene is responsible for the retarded except for education.

Proposal

All State plans, regardless of who administers the funds, should be required to include a plan for the use of the funds for the mentally retarded as well as others.

Problem

Questions raised regarding the Elliott bill.

(1) Are we in favor of this?

(2) How far do we want to go in liberalization of this bill?

Proposal

More Federal funds be made available under provision of the extension and improvement sections of Public Law 565 where State surveys show the need for more sheltered workshops or rehabilitation facilities. These funds should be tied in to needs and available State and private funds within the States and not according to the formula by population.

Statement

Federal Government has spent millions of dollars to help establish sheltered workshops and rehabilitation facilities. These services have proved their value in terms of persons rehabilitated resulting in savings to taxpayers by maintaining them in the community.

That the Federal grants are limited as to time and there is a grave danger that these services will be curtailed or cease to exist when the grants expire.

That the House committee highlight the desirability that the States provide regular grants-in-aid for the continuing operation of the workshops or rehabilitation facilities which have met desirable standards. The Office of Vocational Rehabilitation should be provided with funds to set up consultant positions to assist the States and communities in planning such services.

The concept of rehabilitation facilities in the independent living bill should be expanded to include a "center" which would help individuals to learn to care for themselves as much as possible, to utilize their innate capacities to a maximum degree, to require a minimum or no help from other members of the family in daily living, and be brought together for social and occupational activities and meaningful use of their day.

III. RESEARCH AND PERSONNEL TRAINING

The group agreed that research should be carried out within the framework of the four Federal agencies now having the major responsibility for special education and rehabilitation programs. These four agencies are:

(a) Office of Education.

(b) Office of Vocational Rehabilitation. (c) National Institute of Mental Health.

(d) Children's Bureau.

Congress is to be commended for its interest in legislation and in the appropriation of funds, by means of which a program has been begun in research and personnel training in the area of mental retardation. The studies completed and in progress indicate the complexity of the problem and the need for additional research of a comprehensive and long-range nature to amplify and follow through on the present finding which have served as a framework for future productive investigations. Research in other areas of mental retardation is also needed to form a complete picture of the problem at the various chronological and mental age levels.

Recommendations were as follows:

Office of Education

Support of research should be broadened to include investigation of many complex problems of mental retardation. For example:

There is a need for funds to support the development of new diagnostic

(2) Research is needed in the area of collaborative and long-range studies in learning processes of the mentally retarded.

(3) Traditional curriculums materials are rarely appropriate for the retarded. There is a need for a study of adult mental retardates at the various mental age levels to explore the relationship between curriculum development and specific psychological and educational factors relating to adult adjustment of the retarded. Research is needed to determine the design and relative effectiveness of various curricular materials and the approaches associated with them. The production, try out, evaluation, reproduction, distribution, and use of materials to meet various needs and situations should be integral to the planning and sup-

port of research programs for the retarded.

(4) Further research is needed in the delineation of intellectual functions in the mentally retarded. Research indicates that intelligence is not a unitary process but composed of many factors, and there is a need for longitudinal studies to identify the specific intellectual functions in the development of the mentally retarded.

(5) A single, comprehensive, longitudinal study is needed to point up the interrelationships among the following factors: (a) the location of the mentally retarded at the preschool level; (b) changes in intellectual status during the school years; and (c) absorption of the mentally retarded adult into the com-

munity.

(6) There is a need to strengthen the research staff of the Office of Education in order to render field consultation services. It was also recommended that the review committee for research studies employ research specialists in mental retardation to determine the relevance of the problem to the field of mental retardation.

(7) It was recommended that Public Law 85-926 be expanded to include the training of specialists concerned with the auxiliary disciplines in the area of

mental retardation.

Office of Vocational Rehabilitation

(1) Research in rehabilitation at an international level should be brought to the attention of American professional workers. Staff should be strengthened to achieve this end in order to coordinate, assimilate, and interpret these studies. The group agreed that utilization of knowledge of international developments in special education should be an important aspect of all programs for exceptional children and adults.

(2) There is also a need to implement the findings of existing studies concerned with the factors involved in the adequate vocational adjustment of the

mentally retarded.

(3) It was also recommended that funds be provided for the additional training of vocational rehabilitation counselors in the problems of mental retardation and that additional inservice training institutes be sponsored for this purpose.

National Institute of Mental Health

(1) Research in mental retardation cuts across many biological and sociological disciplines. For example, it was recommended that sociological and psychiatric workers' studies be extended, particularly in the behavorial sciences, to include investigation into family, community, and environmental effects on mental retardates. Other suggested areas for research were: learning and personality factors; population studies of areas in which there is a high prevalence of mental retardation; and the impact of the mentally retarded on family and community life.

(2) Personnel-traineeships should be extended in areas auxiliary to education and rehabilitation of the mentally retarded in order to encourage trainees

to undertake study of special problems and needs in mental retardation.

(3) It was recommended that training of psychologists in the field of mental retardation for direct work with educators be supported inasmuch as the psychologist's evaluation of the abilities of the mentally retarded is a central factor in planning individualized programs for these children.

General recommendation

There is a need to strengthen the Interagency Committee on Mental Retardation to coordinate the work of the units within the Department of Health, Education, and Welfare. For example, it was recommended that the services of the Office of Education and the Office of Vocational Rehabilitation be coordinated in order to facilitate the handling of certain needs of the mentally retarded in areas of education and rehabilitation, these needs being too extensive to be met by either agency alone. Demonstration of educational and vocational projects of a joint nature were suggested as were demonstrations of comprehensive community centers for vocational training.

ATTENDANCE SHEET, WORKSHOP IN SPECIAL EDUCATION AND REHABILITATION

I. I. Goldberg, cochairman, Teachers College, Columbia University. Kay Lynch, New York City Public Schools, BCRMD. Anne Ritter, Kennedy Child Study Center. Barbara Lake, Fordham University, School of Education. Brian Tomlinson, New York University School of Education.

Anna Terubach, Institute for Retarded Children.

Lillian Goldman, Bureau of Curriculum Research, Board of Education, New New York City.

Cornelia Belenkoff, Teachers College Mental Retardation Project. Sol Richman, New York State Division of of Vocational Rehabilitation.

Salvatore DiMichael, U.S. Office of Vocational Rehabilitation.

Doris A. Perry, Teachers College, Columbia University.

John A. Battle, Great Neck Public Schools.

Thomas L. McCulloch, Letchworth Village (New York State Department of Mental Hygiene).

Elkan E. Snyder, Graduate School of Education, Yeshiva University. Irving Ratchick, Director of Public Personnel Services, Levittown, N.Y.

Isaac N. Wolfson, director, Letchworth Village.

Arnold Fassler, Director of Special Education, Long Beach City Schools. Rick Heber, AAMD project.

Dr. Charney, NARC.

A. J. Lutkus, Bureau for Handicapped Children, State Education Department. William Fraenkel, NARC.

Bernice A. Cornish, Teachers College, Columbia University.

Kathleen Marko, Teachers College, Columbia University.

Marietta Gruenert, Paterson State College, Paterson (Columbia University, Teachers College.)

Joseph Shostack, ex-director, Shield of David.

Charles McAllister, Department of Mental Hygiene. Chris J. De Prospo, cochairman, Associate Professor of Education, past president, American Association on Mental Defiencies.

Mr. Elliott. Our next group is that which considered problems pertaining to hearing disabilities and speech impairments.

The report for that group will be made by Dr. Moe Bergman.

STATEMENT OF MOE BERGMAN, COCHAIRMAN, WORKSHOP ON HEARING DISABLED AND SPEECH IMPAIRMENT, ACCOMPANIED BY CLARENCE O'CONNOR

Mr. Bergman. Dr. O'Connor has already appeared before your committee and has given a statement.

The following summarization is just that. There is a more lengthy report, which, with your indulgence, we will submit later.

Mr. Elliott. Can you have it to us within 10 days?

Mr. Bergman. Yes, sir.

There were 30 specialists in the field of speech and hearing impairment meeting in these 2 days at Hunter College, along with other groups. I think the thing we were most impressed with was our most in the field, and that is interpreting the problem of speech and hearing challenging task which we have always known as professional workers difficulties to the public.

To all those who are not suffering from them themselves, that is. We have an old saying in our field in hearing that as far as deafness is concerned, it is awfully hard to sell it to the public because you

cannot see it and nobody dies of it.

Similarly in the field of speech defects, the abnormality of stuttering, to my own way of thinking, and I have been in that for 22 years, is as serious a disorder as we have ever tackled on a national level.

I know it does not kill the body, as some of the diseases we have attacked, and successfully through Federal action, do, but believe me, gentlemen, it pulverizes the personality like nothing else we know.

Certainly it is clear to the individuals who suffer from speech and hearing loss and to their families, that of all our handicaps and all our disabilities, perhaps the inability to communicate with our fellow man is the most painfully isolating of all.

The most conservative statements indicate that at least 8 million persons in this country suffer from speech and hearing problems, so severe as to interfere significantly with their ability to live useful and

productive lives.

In recent years, increasing information has been available on the diagnosis and treatment of persons with these problems. But, unfortunately, we are frustrated in the application of this information to the general population because of certain critical shortages.

First, to repeat what you have heard over and over these past 2 days, there is a distressing lack of specially trained persons necessary to provide the services, and enough training facilities to produce

them.

Second, the required specialized physical facilities for diagnosis and

treatment are woefully inadequate.

Third, the public is still seriously unaware of the enormous waste of human resources which accompany speech and hearing impairment, and, finally, there is a great need for research on the causes, prevention, alleviation, and/or elimination of these impairments.

The workshop committee urged Federal support to meet the short-

ages on a national level if possible.

I would like to state at this point that the group that prepared this report actually divided into three parts, one concerned with the problems of the deaf; another with the problems of the speech impaired; and the third with those of the hard of hearing.

The following report is that concerned with the problems of the

deaf :

The workship committee wishes to stress the desperate school conditions caused by the shortage of classroom teachers of the deaf. There are about 30,000 deaf children of school age in the country today. Approximately 500 specially trained teachers are needed for them each year.

At present there are less than 150 potential teachers under training, and a number of institutions which can provide the training have no

trainees.

The lack of candidates for the training is due in great part to the extra training expense which is required beyond that needed for teaching a class of normal children.

A program of grants-in-aid to training institutions and to teachers

in training is urgently needed.

A federally sponsored program is necessary also to provide fellowships for advanced training of college and university personnel to

staff the teacher training programs.

Provision should be made for the development of persons for research, as well as administrative and supervisory personnel necessary to the education of deaf persons, which we would like to emphasize as much as we can, that much of the deafness and much of the speech problems which today seem to be beyond correction immediately, can, and ultimately, we believe, will yield, if enough intensive effort is given to this problem.

There are certainly straws in the wind that are extremely encouraging, developing of new surgical techniques for one type of deafness, but the type that puts the children in the school for the deaf is still relatively unyielding.

In addition, support is required for the orientation of such personnel as psychologists, psychiatrists, social workers, cottage or residential life personnel, otologists, and audiologists in the special prob-

lems of deaf persons.

Facilities: The committee recognizes the need for comprehensive evaluation centers for the early diagnosis of deaf children. It is recommended that Federal support be given to make possible the establishment of facilities, equipped and staffed for complete team action in the evaluation centers.

Today we know far more about it than yesterday, when we didn't know it was a problem. We find out that we have been misdiagnosing

children for many years because of a shortage of knowledge.

There are many children who we formerly called deaf, for example, who we find today have disorders in the brain, brain injury, and who fail to develop speech in the manner that a deaf child does because of disorders in the brain which are not due to trouble in his ears, and which are still not clear in terms of how they happen, but even more frustrated is our inability to know what to do about these children, how to train them.

The need for research here is desperate. The diagnosis that is made at the age of 11 months, 7 months, and 4 months, even, can make the difference on the direction this child takes the rest of his life, and that

direction can make a great deal of difference to all of us.

The committee recommends the establishment of area community centers for deaf adults where a full range of social, mental hygiene,

family, and vocational guidance will be available.

Federal supporting grants are needed for the construction of the physical plants and to provide the multiple specialized services and personnel to manage the center.

There is need also for regional facilities of diagnosis and training for children with multiple handicaps who also have communication

problems.

Public information: There is a need to bring to the attention of the public realistic information of the great potential of deaf persons for constructive work, and knowledge that the vast majority of them can find employment in the open market after appropriate training, there being no need for them to engage in such practices as begging or seeking subsistence through a dole.

The speech-and-hearing-impaired personnel: The workshop committee for the speech-and-hearing impaired stresses the critical need for personnel, to service some 8 million Americans of all ages who suffer from speech and hearing handicaps in addition to deafness.

It is estimated that at least 1,500 speech pathologists and audiologists, should be trained each year to staff the schools, hospitals, and community centers serving the speech-and-hearing impaired.

Since only about 400 specially prepared individuals are being graduated from colleges and universities at the present time, for service in this field, the workshop committee urges that a program of grant-in-aid fellowships be provided to encourage greater numbers of

candidates for training.

Further, the committee recommends Federal grants to the training institutions so that their programs can be increased to provide for the added student load.

Facilities: At the present time there are relatively few facilities for hard of hearing adult rehabilitation, and a similarly acute shortage of facilities for the preschool child with a severe speech or language,

or hearing disorder.

As we have emphasized in other national conferences held before this workshop, there are relatively few facilities. This is hard to sell to the public, the effect of a partial loss of hearing, yet most of us face it in our loss.

The incidence of hearing loss between age 40 and 50 is increasing. I believe all of us know people close to us who are showing the effects

of increasing isolation due to a loss of hearing in older age.

I might also digress for just a moment to emphasize the fact that the isolation that older people feel in the homes of their families and elsewhere is due not only to the fact that they no longer can go out and produce a day's work, but also because they can no longer communicate, and this is the most devastating of all isolations.

Physical facilities, modern electronic equipment, and highly trained

personnel must be provided.

In particular, the development of centers for the differntial diagnosis of auditory impairment in the preschool age child would represent a farsighted investment in the future, since early diagnosis in these cases is known to make a major difference in the way the child takes his place later as a member of the community.

There is, at present, Federal support for the rehabilitation of adults in certain categories. There appears to be a need to encourage some States to provide the required matching funds to realize the full

potential of whatever legislative support is made available.

There appears to be need, however, for additional Federal action to provide for the rehabilitation of groups of adults not eligible for existing services, each as the following:

(a) Older persons with small pensions or social security;

(b) Persons of employable age, not considered potentially em-

ployable; and

(c) The financially indigent persons for whom welfare and other public agencies now provide limited rehabilitation, often consisting only of the provision of a hearing aid, without training that goes with it.

It is suggested that provisions may be made for the rehabilitation of the foregoing groups under Federal legislation in much the same way that the National Rehabilitation Act now provides for adults

who are potentially employable.

Since many geographic areas of this country are at present completely without services for auditory rehabilitation, it appears that such areas will require Federal financial encouragement to establish speech and hearing centers jointly with communities or regions.

The existence of such centers would insure more effective use of Federal funds now provided through such agencies as the Office of Vocational Rehabilitation, but that would be in areas where facilities to utilize these funds effectively do not exist.

The committee recognizes the need for the establishment and expansion of facilities for year-round language and speech training for

the child who has special speech problems.

There is a tragic break in the program in those communities fortunate enough to have speech correctionists during the summer months when much of the advantage gained during the year are lost entirely during the 3-month period.

This might be thought of in terms of camps or other institutions,

supported by or, at least, encouraged by Federal action.

The committee urges the provision of services for the education of children with brain damage or atypical emotional development which

interferes with the development of oral communication.

The committee on the speech impaired recommends the institution of periodic professional surveys to furnish reliable data on the incidence of the speech problem in persons of all ages, so that no one in need of speech rehabilitation will be overlooked.

I might say that the figure of 8 million that I mentioned was unpalatable to the workshop group. They felt it was far too low, because of percentages which they felt in their own experience were

unrealistic.

But since we do not know exactly from a house to house count, and since the last census of hearing disorders, for example, was taken in 1935 and 1936, by the Public Health Service, we feel it is high time we had an authentic national survey of the incidence of both speech and hearing defects so that nobody who needs the service will be overlooked.

I would like to draw this to a rapid close, knowing the time pressure that you gentlemen are under, by talking just for a moment about

research.

The tremendous human waste due to undiscovered, handicapping loss of hearing can be attacked on a national level through the encouragement and support of mass screening of hearing programs.

It is suggested that Federal aid sponsor basic research laboratories, of the kind already established by the Federal Government in other areas be authorized for the study of audition and communication problems

We are thinking of the type of programs that will be developed through industry and also through mobile testing units reaching the

sections of the country not now serviced by large cities.

Such centers would be devoted primarily to basic services rather than to clinical service, so that the presently frustrating limitations in our knowledge of the mechanisms and causes of undeveloped communication in the young child can be overcome, through an intensive study of highly trained teams of investigators.

The Federal Government has made some inroads on that in Washington, but the need for that kind of a center certainly is great in

many parts of the country.

The organization of such centers should be determined by an advisory committee established legislatively, working cooperatively with the appropriate Federal agency.

At the present time there is a wide variety of techniques employed in the schools in the screening and discovery of children with ear disease and auditory impairment in the schools.

There is urgent need for a Federal aid directed study of present and proposed methods to increase their effectiveness and efficiency of

these methods

Much confusion exists today on the exact incidence of hearing problems in our population. The last national study of hearing impairment in this country was accomplished in 1935–36. The need for an accurate study on a national level is obvious.

In summary, it is apparent that over 8 million Americans are suffering from correctable speech and hearing problems due to critical shortages of personnel and of special educational and rehabilitation

These shortages cannot be overcome unless attacked on a national level, through the kind of support that only the Congress can make possible through its legislative program.

Mr. Elliott. Thank you very much, Mr. Bergman. I listened with a great deal of interest to that report, and I think it is very fine.

You and your coworkers are to be commended for the fine job. (The following statement was submitted by Mr. Bergman:)

STATEMENT REGARDING THE UNMET NEEDS IN THE FIELD OF SPEECH AND HEARING
IMPAIRMENTS AND RECOMMENDATIONS FOR FEDERAL ACTION

The following is a summarization of the labors of 30 specialists in the field of speech and hearing impairment who met in a workshop at Hunter College, 695 Park Avenue, New York City, on October 27 and 28, 1959, from 9:30 a.m. to 4:30 p.m. A list of participants in the area of speech and hearing handicaps is appended to this report.

INTRODUCTION

Of all the handicaps which can afflict a human being, perhaps the most painfully isolating disability for a person in modern society is the inability to communicate with one's fellow man. It may seem strange that the most challenging task for those of us concerned with speech and hearing impairment is to interpret to the public the devastating effects of such impairment on the development of the individual and on his status as a member of his community. There is an old adage about the difficulty of interpreting deafness to the public, "You cannot see it, and nobody dies of it." Similarly, while stuttering does not distort the body, it pulverizes the personality. How many Americans suffer from speech and hearing problems severe enough to interfere significantly with their ability to live useful and productive lives? The most conservative estimates available indicate that the number is somewhat over 8 million persons. In recent years increasing information has been available on the diagnosis and treatment of persons with these problems. Unfortunately, we are frustrated in the application of this information to the general population because of certain critical shortages. First, there is a distressing lack of specially trained persons necessary to provide the services, and of training facilities to produce them. Second, the required specialized physical facilities for diagnosis and treatment are woefully inadequate. Third, the public is still seriously unaware of the enormous waste of human resources which accompanies speech and hearing impairment. And finally, there is a great need for research on the causes, prevention, and alleviation or elimination of these impairments.

This workshop committee urges Federal support to meet these shortages on

a national level.

Within the general category of speech and hearing problems there are three identifiable groups—the deaf, the speech impaired, and the hard of hearing. In the workshop in which this report was prepared separate groups gave their attention to each of these subareas.

THE DEAF

The following is the report of the professional group concerned with problems of deaf persons.

Personnel

The workshop committee wishes to stress the desperate school conditions caused by the shortage of classroom teachers of the deaf. There are about 30,000 deaf children of school age in the country today. Approximately 500 specially trained teachers are needed for them each year. At present there are less than 150 potential teachers under training and a number of institutions which can provide the training have no trainees. The lack of candidates for the training is due in great part to the extra training expense which is required beyond that needed for teaching a class of normal children. A program of grants-in-aid to training institutions and to teachers in training is urgently needed. A federally sponsored program is necessary also to provide fellowships for advanced college and university personnel to staff the teacher-training programs. Provisions should be made for the development of persons for research, as well as administrative and supervisory personnel necessary to the education of deaf persons. In addition, support is required for the orientation of such personnel as psychologists, psychiatrists, social workers, cottage or residential life personnel, tologists and audiologists in the special problems of deaf persons.

Facilities

The committee recognizes the need for comprehensive evaluation centers for the early diagnosis of deaf children. It is recommended that Federal support be given to make possible the establishment of facilities, equipped and staffed for complete team action in the evaluation centers, to all areas, including territorial possessions.

The committee recommends the establishment of area community centers for deaf adults where a full range of social, mental hygiene, family, and vocational guidance will be available. Federal supporting grants are needed for the construction of the physical plants and to provide the multiple specialized services and personnel to manage the center.

There is a need also for regional facilities of diagnosis and training for children with multiple handicaps who also have communication problems.

Public information

There is a need to bring to the attention of the public realistic information about deafness and deaf persons, about their great potential for complete education and training and for constructive work. Perhaps through the offices of the Department of Health, Education, and Welfare, the public should be informed that the vast majority of the deaf can find employment in the open market after appropriate training, there being no need for them to engage in such practices as begging or seeking subsistence through a dole. The workshop committee deplores the continued use of such obsolete terms as "deaf and dumb," "deaf mute," "mute," and other terminology which implies dramatically limited ability in deaf persons.

Research

There is a need for a federally supported study of the communication, emotional, and vocational problems of deaf persons, both children and adults, particularly oriented toward those who are born deaf or became deaf early in life. These and other urgently needed research studies should be the responsibility of the U.S. Office of Education, assisted by a legislatively sponsored Advisory Committee on the Deaf.

THE SPEECH AND HEARING IMPAIRED

Personnel

The workshop committees for the speech and hearing impaired stress the critical need for personnel, to service some 8 million Americans of all ages who suffer from speech and hearing handicaps. It is estimated that at least 1,500 speech pathologists and audiologists should be trained each year to staff the schools, hospitals, and community centers serving the speech and hearing impaired. Since only about 400 specially trained individuals are being graduated from colleges and universities at the present time, for service in this field, the

workshop committee urges that a program of grant-in-aid fellowships be provided to encourage greater numbers of candidates for training. Further, the committee recommends Federal grants to the training institutions, so that their programs can be increased to provide for the added student load.

Facilities 4 8 1

At the present time there are relatively few facilities available for hard-ofhearing adult rehabilitation, and a similarly acute shortage of facilities for the preschool child with a severe speech or language or hearing disorder. Physical facilities, modern electronic equipment, and highly trained personnel must be provided. In particular, the development of centers for the differential diagnosis of auditory impairment in the pre-school-age child would represent a farsighted investment in the future, since early diagnosis in these cases is known to make a major difference in the way the child takes his place later as a member of the community.

There is, at present, Federal support for the rehabilitation of adults in certain categories. There appears to be a need to encourage some States to provide the required matching funds to realize the full potential of whatever legislative support is thus made available. There appears to be need, however, for additional Federal action to provide for the rehabilitation of groups of adults

not eligible for existing services, such as the following:

(a) Older persons with small pensions or social security;
 (b) Persons of employable age, not considered potentially employable;
 and

(c) The financially indigent persons for whom welfare and other public agencies now provide limited rehabilitation, often consisting only of the provision of a hearing aid.

It is suggested that provisions may be made for the rehabilitation of the foregoing groups under Federal legislation in much the same way that the National Rehabilitation Act now provides for adults who are potentially employable.

Since many geographic areas of this country are at present completely without services for auditory rehabilitation, it appears that such areas will require Federal financial encouragement to establish speech and hearing centers jointly with communities or regions. The existence of such centers would insure more effective use of Federal funds now provided through such agencies as the Office of Vocational Rehabilitation.

The committee recognizes the need for the establishment and expansion of facilities for year-round language and speech training for the child who has special speech problems. The committee urges the provision of services for the education of children with brain damage or a typical emotional development

which interferes with the development of oral communication.

The committee on the speech impaired recommends the institution of periodic professional surveys to furnish reliable data on the incidence of the speech problem in persons of all ages, so that no one in need of speech rehabilitation will be overlooked.

Public information

The committee urges that the public be given fair and objective information about persons with oral communication problems through the development of materials, films, and pamphlets on the nature of speech and hearing problems and on the potential for rehabilitation for persons so afflicted. A federally inspired program should disseminate information about speech and hearing disorders to well-baby clinics, pediatricians, general medical practitioners, and others. The urgency for recognizing and dealing with these problems as early in life as possible must be emphasized to insure the development of self-sufficient, self-supporting adults, and to provide vital clues as to the causes of the disorder. Encouragement should be given to the broadening of medical education to include recognition of significant early signs, since recent findings indicate that a considerable portion of the physician's time is spent on treatment of diseases of the ear, nose, and throat. We urge that Federal initiative and support be given to encourage the development of programs for orientation of parents of children with speech or hearing disabilities.

Research.

The tremendous human waste due to undiscovered, handicapping loss of hearing can be attacked on a national level through the encouragement and support of mass screening-of-hearing programs.

It is suggested that Federal aid sponsor basic research laboratories of the kind already established by the Federal Government in other areas for the study of audition and communication problems. Such centers would be devoted primarily to basic service rather than to clinical service, so that the presently frustrating limitations in our knowledge of the mechanisms and causes of undeveloped communication in the young child can be overcome through an intensive study by highly trained teams of investigators.

The organization of such centers should be determined by an advisory committee established legislatively, working cooperatively with the appropriate

Federal agency.

At the present time there is a wide variety of techniques employed in the screening and discovery of children with ear disease and auditory impairment in the schools. There is urgent need for a federally directed study of present

and proposed methods to increase their effectiveness and efficiency.

Much confusion exists today on the exact incidence of hearing problems in our population. The last national study of hearing impairment in this country was accomplished in 1935–36. The need for an accurate study on a national level is obvious.

Summary

In summary, it is apparent that over 8 million Americans are suffering from correctable speech and hearing problems due to critical shortages of personnel and of special educational and rehabilitation facilities. These shortages cannot be overcome unless attacked on a national level, through the kind of support that only the Congress can make possible through its legislative program.

Respectfully submitted.

Dr. Clarence O'Connor, Cochairman. Dr. Moe Bergman, Cochairman. Dr. Leo E. Connor, Recorder.

Dr. Clarence D. O'Connor, superintendent, Lexington School for the Deaf.

Dr. Moe Bergman, director, Speech and Hearing Clinic.

Dr. Leo E. Connor, assistant superintendent, Lexington School for the Deaf. Mr. David Altschuler, Division of Vocational Rehabilitation, New York State.

Dr. Godfrey Arnold, clinical director, National Hospital for Speech Disorders. Mr. Daniel T. Cloud, superintendent, New York School for the Deaf.

Dr. Robert Dean, medical rehabilitation, medical director, Office of Vocational Rehabilitation, New York City.

Dr. Jon Eisenson, director, Speech and Hearing Clinic, Queens College.

Miss Katherine P. Geary, speech and Hearing Clinic, Queens Conege. Miss Katherine P. Geary, supervisor, teacher training, Junior High School 47. Sister Rose Gertrude, superintendent, St. Mary's School for the Deaf, and Sister Regina.

Dr. Louise Gurren, director of speech improvement, board of education.

Dr. Dan Harrington, children's bureau.

Dr. Leola Horowitz, director, Speech and Hearing Clinic, Adelphi College. Mrs. Shulamith Kastein, Speech and Hearing Clinic, Presbyterian Hospital.

Dr. Doris Leberfeld, Department of Hospital Speech Pathology, Flower-Fifth Avenue Hospital.

Mrs. Rosalind Levinson, placement, New York League for the Hard of Hearing. Mrs. Dorothy Lewis, director, educational services, New York League for the-Hard of Hearing.

Mr. Alby Lutkus, bureau for handicapped children, State education department. Mr. Donald Markle, director, Speech and Hearing Clinic, Bellevue Hospital.

Miss Harriet McLaughlin, principal, Junior High School 47.

Mrs. Tanya Nash, director, Jewish Society for the Deaf.

Mrs. Eleanor Ronnei, executive secretary, New York League for the Hard of Hearing.

Dr. Paul Rotter, assistant to the superintendent, Lexington School for the Deaf. Dr. Bruce Siegenthaler, Pennsylvania State University Speech and Hearing Clinic, representing American Speech & Hearing Association.

Dr. Robert West, professor of speech, Brooklyn College.

Dr. Emil Aabell, assistant director, Jewish Society for the Deaf.

Dr. Jane Zimmerman, professor of education, Teachers College, Columbia University.

Mr. Elliott. Our next group is the neuromuscular and orthopedic impairment and chronic disabilities, and the chronically ill and disabled.

The neuromuscular and orthopedic impairment chronic disabilities group is headed by Dr. M. McCavitt and Dr. George Zukerman. The chronically ill and disabled group was headed by Dr. Frances Connor and Dr. Pollicoff. They, together, present their reports.

Dr. McCavitt and Dr. Connor, we are happy to have you and look

forward to your reports.

STATEMENTS OF M. McCAVITT, COCHAIRMAN, WORKSHOP ON NEUROMUSCULAR AND ORTHOPEDIC IMPAIRMENTS AND CHRONIC DISABILITIES, AND DR. FRANCES CONNOR, COCHAIRMAN, WORKSHOP ON CHRONICALLY ILL AND DISABLED

Mr. McCavitt. Gentlemen, more than 50 individuals from New York State participated in our 2-day workshop study sponsored by

the committee of special education and rehabilitation.

These men and women represented more than 40 public and private organizations and programs concerned with the evaluation, treatment, education, training, counseling, and placement of the multiple-handicapped men, women, and children.

They represented many disciplines and professions, including medical, social, educational, psychological, vocational, and recreational, at all levels of operation, supervision, planning, and management.

Initially, our plan called for the three separate workshops, one to represent the neurologically impaired, one to represent the orthopedically disabled, and a third to include all the chronically ill and disabled.

There was a strong feeling of these groups that we should meet jointly, at least initially, because of the many apparent needs of these ill and disabled, what they have in common, and particularly because of the thousands of individuals with multiple handicaps that may be included in one or more of the programs or groups.

Again, the need for joint effort was evident when the workshop sessions convened. The individual participants, too, unanimously felt that there was such commonality of problems and needs that they pre-

ferred to work through these areas and submit a joint report.

Represented in the thinking and planning were many separate and

distinct diagnostic entities, including heart disease, cancer, multiple

sclerosis, polio, muscular dystrophy, and cerebral palsy.

Also represented were individuals from such State and private organizations as the division of vocational rehabilitation, the State employment service, various public schools, private schools, and one representative from the Governor's committee on the employment of the handicapped.

This will give you some indication that we were concerned at all

levels with this particular problem.

Dr. Zukerman, of course, from the board of education; Dr. Pollicoff, associate professor of physical medicine rehabilitation, Albany College, of Union University; Dr. Connor, associate professor at Teachers College, Columbia University, and myself, representing a private group, United Cerebral Palsy, New York City.

By agreement of the cochairmen the report of the workshop sessions would be divided into two parts; I will speak generally on rehabilita-

tion needs and Dr. Connor will focus on the special education.

The workshop group wishes to take this opportunity to commend the Congress on the interest and the support of rehabilitation services to the disabled throughout the country for many, many years. They recognize, however, that the needs for extension of these services needed to be expanded and included, and we felt that perhaps very briefly we could define these and expand upon these, talk about these, under four headings.

One is services, the other personnel needs, the other research, and,

finally, additional information under public education.

Under services of rehabilitation programs, we felt that independent living rehabilitation services need to be including evaluation and comprising both the diagnostic and the referral services, and that this agency should administer such programs and this determination should be made on the State level.

It was also felt that we should provide support for sheltered work-

shops, for individuals requiring long-term programs.

Under this heading, it was believed that consideration should be given to the provisions for the establishment of a central agency similar to the national industries of the blind that now exist for the procurement of such contracts for Federal agencies and the distribution of the contracts for sheltered workshops with homebound programs, and that a provision be made for the Federal agencies to fulfill their requirements for certain products through procurement from sheltered workshops and homebound programs.

Another need under the area of services was to provide support of demonstrations for the homebound, to include homemaking and housekeeping, recreation, education, and rehabilitation services for all ages, to provide support and demonstration projects for long-term

residential care for the disabled.

Provision should also be made, it was felt, by the creation and support of a Federal interagency body to include both public and private agencies to collect and disseminate information and to coordinate

and integrate services.

It was strongly felt that in order to provide and to take advantage and utilize all the services that are now in effect, or will be provided, that there will be some additional provisions made for transportation, or, at least, this problem would be studied, for individuals with multiple handicaps.

In the area of personnel, I had one or two recommendations to

make, and this will be supplemented by Dr. Connors.

The first is the provision of training of personnel to increase the numbers requiring the training for additional neurologists, psychiatrists, nurses, clinical therapists, clinical psychologists, recreational therapists, and group workers, sheltered workshop personnel, rehabilitation counselors, and administrative personnel.

And also to provide for the support of personnel budget of facili-

ties where no other sources of funds are available.

Under the heading of research, it was felt that there should be a continuation and extention of the present grants-in-aid program for basic clinical and Federal research in the areas of education, vocational and medical rehabilitation, that there should be support for projects to delineate the factors required for the comprehensive long-

term care of the disabled of all ages from preschool age through the aged.

Finally, under research, the support of projects to establish the actual incidence of the disabled and to maintain current State and/or

regional registeries of the disabled.

Our final recommendation under the heading of public information was in order to improve the efficiency, and we were very concerned about that throughout our entire workshop of 2 days, that the efficiency on the available services to the disabled, a need exists for the correlation and the education of information among all agencies, public and private, providing these services.

I would like to just say at this time that we appreciate coming, and Dr. Connor will supplement the area particularly pertaining to

education.

Mr. Elliott. Thank you very much.

Dr. Connor, you may proceed.

Dr. Connor. Reports of the U.S. Office of Education estimate that about 4 percent of the boys and girls in school would fit under

this category that we are discussing this afternoon.

In the group are included youngsters with cerebral palsy, epilepsy, and some of them with brain injury that we put in quotes because although you don't have a manifestation of a physical abnormality there are some serious learning problems that they have.

Also are those children with special health problems.

As Dr. McCavitt said, those with cardiac conditions, rheumatic fever, and other conditions, as well as an increasing number of children who are diagnosed as having progressive conditions, such as cancer, leukemia, muscular dystrophy, multiple sclerosis, and other conditions.

These children were previously usually excluded from school because of the type of condition that they had, because they were becoming progressively less able to participate in school, they were more burdensome for teachers to manage, and very frequently were

excluded from school.

Now, we find that more of them are attending schools in various

ways.

As you know, some of these children, especially those with mild handicaps, go to school in the regular classroom, with regular teachers, with or without help from a person who is qualified to work with the youngsters specifically.

Other children attend special classes in special schools where they can get occupational therapy, physical therapy, speech; they have the services of a trained social worker and psychologist with their

school program.

Others go to school while they are in the hospital, while under intensive medical care. Teachers are employed, we hope, by the boards of education, to go into the hospital and work with the children.

Other children go to school in their own homes. There are a lot of reasons for that. Some of the reasons are because the homes themselves are, because it is too difficult to get out of them in the morning, if they have to walk up and downstairs which they cannot mount, or because of transportation, which is a very expensive proposition.

Or because of the architecture of the school, the doors are too narrow to go into the building or they can't move around easily, or because the schools just don't have any special facilities or special classes

which are desperately needed for them.

Or it might be because the children themselves have to remain in bed because they just don't have the physical stamina to do all those things we take for granted, like getting dressed, getting ready, getting to the bus, getting to the school, staying in a fairly upright position from 9 o'clock in the morning until 3.

But, nevertheless, we are providing in many communities programs of home instruction for these youngsters. We are very much concerned, however, about the lack of trained personnel and that often home instruction teachers are those people who have been encouraged or cajoled in some way to assume responsibility for going in and spending an hour or so with the child, or after he has been in school for a full day, or by getting volunteers to go in to schools and hos-

pitals.

We believe they need some very good teachers.

With the parents concerned with service and community awareness of the problem, more and more severely handicapped children are coming into the school programs. Because of the complexity of their problems, which may be caused by the presence of one or more of the following—for instance, their fingers are involved so that they can't use pencils as other children do, they might have poor arm motion, they might have just lowered vitality, poor ambulation, just highly distractible youngsters who can't participate, or they might have speech difficulty so the teachers don't understand or can't afford to take the time to listen to the children—these people need very special teaching methods and materials and they need very special teachers, we believe.

Most important, and too overlooked, because of a high degree of specialization—this is moving to the other side of the picture—we are so highly specialized that we sometimes overlook the hearing difficulties of children, their vision problems, their mental retardation—all these areas that have been discussed by earlier group reports.

These are often overlooked because we have separated these particular children from the general population on the basis of a single or

specific physical problem which we have mentioned.

Consequently, one of the major needs discussed by the workshop group was that of multiple handicaps.

Children don't come with just one handicap always, so we must

look at it from a total picture.

The group strongly opposed the continuation of the fragmentation of programs for small groups of handicapped children. Such considerations in the workshop resulted in the following conclusions:

(1) We need highly qualified special education leadership at the local, the State levels, and in the colleges, to increase the number of effective teachers to work with children with varying degrees of handicaps and varying kinds of handicaps, not just specialists in one particular area.

This we felt could be done through the traineeship program for the preparation of educational supervisors, administrators and college teachers, as well as the supporting grants to the training institutions

as has been legislated for the mentally retarded.

(2) To assure the utilization of these well qualified educational leaders, the workshop participants asked that you be apprised of the need for support of the personnel budgets of comprehensive special education and rehabilitation facilities where no other sources of funds are available.

This was inspired by the fact that we can have highly qualified persons to work in colleges. They have come from a school system where there have been expert teachers, highly recognized, earning, let me

say, \$6,000.

Now they have been trained to work in a college, and you know

what the college salaries are.

Some of the States are begging us for personnel for their teacher education programs, but they are offering salaries like \$4,200, \$4,500,

and our people are saying "Should we go there?"

We felt that if we were going to train these people and they are going to come in with good academic backgrounds and good experience backgrounds there should be places for them to go with enough satisfaction in the job so that they can use the talents that they have.

(3) We need to know who these children are, really, where they

are, and what their problems are.

Thus, we, too, recommend the establishment and maintenance of current either State or local or regional registries on a nationwide basis, so that we have comparable data throughout the country and we know who these children are and what their needs are, not how many have cerebral palsy, butw hat they need.

If we had something consistently reported, we believe we would

have a basis on which to operate.

(4) We want to know more about the learning problems of children and the impact of chronic illness and progressive and deadly conditions, such as cancer and muscular dystrophy on the child, on his family, and on the teacher.

What does that mean to the teacher with a certain set of values to work with children who aren't going anywhere. Maybe they are

going to die in the next couple of years.

We believe we have to know more about the impact of these conditions on the child, his family and the teacher, too, and we might say that we are gratified by the Federal grants for basic and field research in education, particularly through the Office of Education, because through these we have been able to look critically at some of the important aspects of education.

We urge your continued support of such research grants.

(5) And lastly, we were stimulated by the effects of this interdisciplinary and interagency workshop which we have just completed, despite the fact we are tired.

The group has asked for Federal support of an interdisciplinary character or of an interdisciplinary conference on national and re-

gional levels to be held at regular and frequent intervals.

Such conferences might follow the pattern of the White House Conference, but maybe we could ask for them a little more often than the White House Conference.

We believe that through the comprehensive program of education and care of the handicapped, individuals from the preschool ages, the little tiny tots, to the aged, will restore their personal dignity, will enrich our society and help us utilize the potential of our citizens,

Thank you very much.

Mr. Elliorr. Thank you both. Your reports were very fine and we appreciate them.

(The following statement was submitted by Dr. McCavitt:)

Workshop of Neuromuscular and Orthopedic Impairments, Chronically Ill and Disabled

Dr. Martin McCavitt, Dr. George Zuckerman, Dr. Frances P. Connor, Leonard Pollicoff, M.D.

The committee on chronic illness and disabilities in conjoint with the committee on orthopedic disabilities and physically handicapped workshop section presents the following reports based on the unanimous opinions of those participating.

The following needs are felt to exist:

I. IN THE AREA OF RESEARCH

(a) Continuation and extension of the present grants in aid program for basic clinical and field research in the areas of education, vocational, and medical rehabilitation.

(b) Support of projects to delineate the factors required for the comprehensive

long-term care of the disabled at all age levels.

(c) Support of projects to establish the actual incidence of disabilities and to maintain current State and/or regional registries of the disabled.

II. PERSONNEL

(a) Provision of training of personnel to increase the numbers of required personnel in short supply including neurologists, psychiatrists, nurses, physical therapists, occupational therapists, clinical psychologists, social workers, recreation therapists, recreation group workers, sheltered workshop personnel, re-

habilitation counselors, and administrative personnel.

(b) To increase the supply of teachers and to improve the quantity of instruction for children with chronic medical problems, neurologically orthopedically and orthopedically disabled through training grants for leadership personnel including education supervisors and administrators and college teachers with supporting grants to the training institution, as is already legislated for the area of the mentally retarded.

(e) Provide funds for the support of the personnel budget of comprehensive special education and rehabilitation facilities where no other sources of funds

are available.

III. SERVICES

(a) Need for extension of rehabilitations services to independent living rehabilitation services to include evaluation comprising both diagnosis and referral.

(b) The agency to administer such programs shall be determined by the individual State.

(c) Transportation: In order to utilize services existing and projecting, pro-

vision for transportation of disabled individuals is essential.

(d) Provide support for sheltered workshops for individuals requiring long-

term programs.

(e) Provide support of demonstration projects for the homebound to include homemaking and housekeeping, recreation, education and rehabilitation services

at all age levels.

(f) Provide support of demonstration projects for long-term residential

care of the severely disabled.

Provision should be made for the creation and support of a Federal interagency body, to include both public and private agencies, to collect and disseminate information and to coordinate and integrate services.

IV. IMPROVED EFFICIENCY

In order to improve the efficiency of available services to the disabled, a need exists for the correlation and exchange of information among all agencies, public and private, providing such service.

(1) That disciplinary conferences supported by Federal funds be held, on a

national and regional level, at regular and frequent intervals.

It is therefore recommended that-

(a) There is a need for providing better sources of information to the general public on the availability of services and to disseminate such information through the various media of communication.

(b) There is a need for greater public knowledge of the educational

and employable potential of the disabled.

This workshop recommends, in addition to the above, that the major problem existing in the education and rehabilitation of the disabled is the provision of comprehensive services to the multiple handicapped.

ATTENDANCE LIST

L. D. Policoff, Albany Medical College.

Jay Schleichkorn, United Cerebral Palsy Association, New York State.

Edward Kilbane, United Cerebral Palsy, New York State.

K. Allan, Cancer Care.

Leonora B. Rubinow, National Association of Social Workers.

Evelyn McNamara, the National Foundation,

Grace C. McCandless, Bureau for Education of the Physically Handicapped.

Edna M. Lawrence, Vocational Advisory Service. Anne Altman, New York State Employment Service.

Irving M. Friedman, Governor's Committee on Employ the Physically Handi-

Ralph Abramson, Federation of the Handicapped.

Anna J. Kalmanowitz, New York Heart Association.

Howard Riley, New York Teachers College, Columbia University.

Frances J. Barnes, Teachers College, Columbia University.

Edward LaCrosse, Teachers College, Columbia University.

Gloria F. Wolinsky, Hunter College.

Anna C. Smerka, Lackawanna Board of Education.

Joseph J. Endrus, National and State Society for Crippled Children and Adults. H. Michol-Smith, New York Medical College, Flower-Fifth Avenue Hospital. Robert C. Darling, Columbia University, College of Physicians and Surgeons.

Harry Katz, D.V.R. New York City. Roland H. Spaulding, School of Education, New York University.

Rose Marie Hernandez, National TB Association.

Mona G. Bronson, United Cerebral Palsy of New York State.

Margaret A. Losty, Bureau for Handicapped Children, New York Department of Health.

Harry Sands, United Epilepsy Association.

Ralph Cancro, Burke Foundation.

George Zuckerman, Board of Education, New York City.

Beatrice V. Hill, National Recreation Association.

Juliana Simpson, National Recreation Association.

Abraham Lieberman, State workmen's compensation board. D. S. Schilling, Board of Cooperative Educational Services.

Martin McCavitt, United Cerebral Palsy of New York City.

Harry Lyons, United Cerebral Palsy Association (national).

Frances P. Connor, New York Teachers College, Columbia University. Helen B. Holodnak, National Multiple Sclerosis Society.

J. Morrison Brady, M.D., Muscular Dystrophy Association of America.

Leonard Diller, Institute of Physical Medicine and Rehabilitation.

I. Jay Brightman, M.D., State and Interdepartmental Health Resources Board. John Cummings, New York State Division of Vocational Rehabilitation.

Lawrence Taft, M.D., Albert Einstein College of Medicine.

Lucy Blair, American Physical Therapy Association.

Mrs. Galloway Cole, United Epilepsy Association.

Jerry G. Cochran, Teachers College, Columbia-Recorder.

Richard Lubell, board of education, special assistant director, child welfare.

Emil A. Lombardi, C. P. School, Roosevelt, N.Y.

Alby T. Luthin, B.H. Children, State educational department. W. K. Shaughnessy, Community Council of Greater New York. Marcus Arnold, board of education. James Burrows, ICD.

Sol Feingold, UCP of Queens.

Mr. Elliott. Our next group is the group on limited vision, headed by Mrs. Helen Fields, Miss Helen Gibbons.

STATEMENTS OF MRS. HELEN FIELDS AND MISS HELEN GIBBONS, COCHAIRMAN, WORKSHOP ON LIMITED VISION

Mrs. Fields. Miss Gibbons will read.

Miss Gibbons. First, may I say that we as a group are appreciative of the opportunity to present the report on the thinking of the group of people interested in the limited vision.

This material is the consensus report of a group made up of those interested in rehabilitation, in ophthalmology and in education.

It is the opinion of this group that very little emphasis has been placed on providing adequate services to partially seeing children, youth, and adults.

Historically, the legally blind have been expected and thought of as a distinct group, but the partially seeing have been sadly neglected.

It must be recognized that the partially seeing are a separate group with problems different from those of the blind, requiring special techniques and services.

The partially seeing group of children, youth, and adults, are immeasurably larger than the easily definable legally blind. There is a need for recognition and redefinition of the term "limited vision," which is more commonly referred to as visually handicapped.

At the present time, the term "limited vision" includes— (1) The partially seeing who have corrected vision of 20/70

or less;

(2) The legally blind who use print;
(3) The legally blind who use braille; and

(4) Any person who, in the opinion of a qualified diagnostic team requires special education and rehabilitation services.

The term "visually limited" should be redefined to include all individuals who, by virtue of ocular pathology are educationally or vocationally limited.

The partially seeing are the greatest number of this group.

Therefore, it is recommended that a Federal grant be allotted for study of the total number of partially seeing in all school enrollment as a continuing study of spotchecks made by the National Society for Prevention of Blindness, estimating that 1 in 500 partially seeing are in our school enrollments.

The purpose of such a study would be to provide a basis to justify the need for adequate educational and rehabilitation services for this

group.

There is a general shortage of qualified professional personnel, that is, teachers, psychologists, psychiatrists, social workers, educational guidance and rehabilitation counselors, doctors and nurses, needed to provide services to partially seeing persons.

This group is vastly larger than now being served under the defini-

tion of legally blind.

Since it is estimated that there are 4,000 public school partially seeing children in New York State, there is a great need to recruit and prepare qualified teachers and supervisors.

It is estimated that 270 teachers are needed to bring services to

these children.

If colleges and universities are to establish and staff necessary courses of preparation, there is need to supplement funds available for such

training courses, from Federal moneys.

Therefore, it is recommended that the National Defense Education Act include traineeships for personnel preparing to teach at the college level in the field of partially seeing, funds to assist the recruiting of such personnel, that Federal funds in the form of grants in aid or scholarships, fellowships, or traineeships to colleges, universities, and specialized schools be made available and increased in order to train qualified professional personnel, including among them beyond the teachers, the doctors, the nurses, the psychologists and psychiatrists, social workers, educational guidance and rehabilitation counselors, so that they can have a better understanding of the educational, vocational, and rehabilitation implications of ocular defects, and so that adequate services can be provided for the partially seeing.

That financial assistance be granted to colleges, universities, and specialized schools, to include essential courses in their curriculums

dealing with the problems of the partially seeing group.

That Federal funds be alloted for the provision of inservice training seminars, in extensive short-term training and workshops for practitioners in the various disciplines as well as for administrators.

There is a need for extension of special educational supplies and equipment to service any partially seeing individual in need of the same materials which are now provided by the Federal Government

only to the legally blind.

Therefore, it is recommended that any visually handicapped individual requiring special education, training, and rehabilitation, should have available to him all existing materials purchasable on quota account from the American Printing House for the Blind.

There is need for increased development, publication, and distribution of more books and equality for all visually limited persons who

use print in order to provide equality of education for them.

Therefore, we recommend that the American Printing House be encouraged to expand its facilities and be permitted to purchase from the manufacturers of books, machines, or equipment from any established and reputable source, and that the distribution quota be expanded to take care of all the needs of each State without regard to the present limitation of \$30 per capita.

There is a serious lack of rehabilitation centers which can provide appropriate services for the partially seeing in terms of complete evaluation, vocational training, family counseling, and research.

At present, only a few of the existing private rehabilitation centers

for the blind accept the partially seeing for limited service.

Some of the private rehabilitation centers working with handicapped groups have expressed concern about working with partially seeing because of their limited knowledge about this group.

Therefore, it is recommended that Federal funds be allotted for the support of rehabilitation centers, which, as a part of their program,

can provide adequate services to the partially seeing in terms of casework, testing, evaluation, and vocational training for independent living, and placement, as well as expansion of present rehabilitation centers.

There is a general dearth of long-range workshops for the severely handicapped throughout New York State. The existing ones are privately operated and, to a degree, depend upon their own production for their continuation, so that a large proportion of severely handicapped persons cannot be accepted because they do not meet production standards.

In addition, the existing workshops are very limited in the types of services and vocational activities offered. There is also a need for research on the problems of the partially seeing, who cannot compete

in private industry.

Therefore, it is recommended that Federal funds be allotted for the expansion of existing private workshops and for the support of New York shops to promote remunerative employment to the partially seeing who cannot readily be absorbed in the competitive labor market.

These workshops should provide evaluation of work potential, developments of working capacity, remunerative employment, and

placement

Now, we come to our last item, research needs in educational and

rehabilitation material for the partially seeing individuals.

Since the partially seeing represent a large segment of our population, there is an evident need for a Federal roster to acquire constant knowledge of the diseases resulting in partial vision. For example, in the conquest of retrolenial fibroplasia, statistical knowledge alone played a major role.

And, secondly, to determine educational needs; and thirdly, to help

determine the extent of rehabilitation services needed.

Good school placement, rehabilitation programs, depend to a great extent on effective measurement and evaluation, aptitude, intelli-

gence, personality.

Present instruments of measurement are largely visual ones. Therefore, we recommend that there is a need for intensified research in the direction of more valid psychological testing, the results of which will not be matched by the visual handicap.

Many ocular defects are easily remedial during early childhood. The same defects may be resistant to all forms of treatment during

the rest of the individual's life.

Therefore, we recommend that there is a great need for case finding of infants and preschool children with visual defects and recommend that Federal funds be allocated for research into the development of more adequate and effective methods of vision screening.

At present, all large type materials published by the American Printing House and private sources are printed in 18- and 24-point

type.

Neither of these type sizes are equally effective for all partially see-

ing individuals.

There is a great variation in a person's ability to use these type sizes effectively. Therefore, it is recommended that there is a need for re-

search to determine what type sizes are most useful for partially see-

ing individuals.

And, lastly, at present the clinical programs for the development and use of low vision aids have effectively helped partially seeing persons

Therefore, we recommend that Federal funds should be allotted for an expansion and coordination of the scattered efforts made now to

provide optical aids.

Mr. Elliott. Thank you very much, Mrs. Gibbons.

Mrs. Fields. I would like to say that this represents interagreement of all members of the group.

Mr. Elliott. Thank you so much, Mrs. Fields.

Let me say to the eight groups who have worked long and hard in the workshops sponsored by the study group of our subcommittee that I think that the results of your work is the most effective evidence that has been brought before a congressional committee that I have had the privilege to serve on.

The committee is deeply indebted to you for it.

Also, we want to express to Dr. Elena Gall, professor of special education, and director of the field studies for our special education and rehabilitation study, the expressed thanks of the committee because she has been in charge, along with Dr. Fenton, of the organization of this workshop held at Hunter College, from which this very up to date and very effective testimony has come to us.

(The following statement was presented by Mrs. Fields:)

REPORT OF WORKSHOP SPECIAL EDUCATION AND REHABILITATION—LIMITED VISION

Cochairmen: Helen W. Fields, Helen G. Gibbons

INTRODUCTION

It is the consensus of this group that very little emphasis has been placed on providing adequate services to partially seeing children, youth, and adults. Historically, the legally blind have been accepted and thought of as a distinct group, but the partially seeing have been sadly neglected. It must be recognized that the partially seeing are a separate group, with problems differing from those of the blind and requiring special techniques and services. The group of partially seeing children, youth, and adults is immeasurably larger than the easily definable legally blind group.

NEED

1. There is a need for recognition and redefinition of the term "limited vision," more commonly referred to as "visually handicapped." At present the term "limited vision" includes:

(a) The partially seeing who have corrected vision of 20/70 or less.

(b) The legally blind who use print.(c) The legally blind who use Braille.

(d) Any person who, in the opinion of a qualified team, requires special

education and rehabilitation services.

The term "visually limited" should be redefined to include all individuals who by virtue of ocular pathology or refractive error are educationally or vocationally limited. The partially seeking make up the greatest number of this group.

It is therefore recommended

That a Federal grant be allotted for study of the number of partially seeing in the total school enrollment as a continuing study of "spot checks" made by the National Society for the Prevention of Blindness and disclosing an estimated I in 500 of the school population to be partially seeing. The purpose of such

a study would be to provide a basis to justify the need for more adequate edu-

cational and rehabilitation services for this group.

2. There is a general shortage of qualified professional personnel—teachers, psychologists, psychiatrists, social workers, educational guidance and rehabilitation counselors, doctors and nurses—to provide adequate services to partially seeing people. This group is very much larger than those now served under the definition of legally blind.

It is therefore recommended

That the National Defense Education Act legislation include—

(a) traineeships for personnel preparing to teach at the college level in the field of the partially seeing;

(b) funds to assist in recruiting such personnel.

3. There is a great need for case finding of infants and preschool children with visual defects. Many ocular defects are easily remediable during early childhood; these same defects may be resistant to all forms of treatment during the rest of an individual's life.

It is therefore recommended

That Federal funds be allotted for research in the development of more ade-

quate and effective methods of screening in these areas.

4. At present all large-type materials published by the American Printing House for the Blind and by private sources are printed in 18- or 24-point type. Neither of these type sizes is equally effective for all partially seeing individuals. There is great individual variation in the ability of persons to use these type sizes effectively.

It is therefore recommended

. That Federal funds be allotted for research to determine what type sizes are most useful for partially seeing individuals.

5. At present clinical programs for the development and use of low-vision aids have effectively helped many partially seeing persons.

It is therefore recommended

That Federal funds be allocated to the expansion and coordination of the

scattered efforts made to provide optical aids.

6. There is a serious lack of rehabilitation centers which can provide appropriate services for the partially seeing in terms of complete evaluation, vocational training, family counseling, and research. At present only a few of the existing private rehabilitation centers for the blind accept the partially seeing for limited service. Some of the private rehabilitation centers working with handicapped groups have expressed concern about working with the partially seeing because of their limited knowledge about this group.

It is therefore recommended

That Federal funds be allotted for the support of rehabilitation centers which, as a part of their program, can provide adequate service to the partially seeing in terms of casework, testing, evaluation, and vocational training for independent living and placement, as well as for expansion of the present

rehabilitation centers.

7. There is a general dearth of long-range workshops for the severly handicapped throughout New York State. The existing ones are privately operated and, to a degree, depend upon proceeds from their own production for continuation so that a large proportion of severely handicapped persons cannot be accepted because they do not meet production standards. In addition, the existing workshops are very limited as to types of services and vocational activities offered. There is also a need for research on the problems of the partially seeing who cannot compete in private industry.

It is therefore recommended

That Federal funds be allotted for the expansion of existing private workshops and for the support of new workshops to promote remunerative employment to the partially seeing who cannot readily be absorbed in the competitive labor market. These workshops should provide evaluation of work potential, development of work capacity, remunerative employment, and placement.

Rescarch needs in educational and rehabilitation material for partially seeing individuals.—Since the partially seeing represent a large segment of our population, there is evident need for a Federal roster-

(a) to acquire constant knowledge of the diseases resulting in partial vision (in the conquest of retrolental fibroplasia statistical knowledge alone played a major role);

(b) to help determine educational needs:

(c) to help determine the extent of rehabilitation services needed.

8. Good school rehabilitation programs depend to a great extent on effective measurement and evaluation of aptitude, intelligence, and personality. Present instruments of measurement are in a type size not easily readable by many of this group.

It is therefore recommended

That Federal funds be allotted for intensified research in the direction of more valid psychological testing, the results of which will not be masked by the visual handicap.

9. Since it is estimated that there are 4,000 partially seeing children in the public schools of New York State, there is a great need to recruit and prepare qualified teachers and supervisors. (It is estimated that 270 teachers are needed to provide services to these pupils.) If colleges and universities are to establish and staff necessary courses of preparation, there is need to supplement funds available for such training courses from Federal moneys.

It is therefore recommended

(1) That Federal funds in the form of grants-in-aid as scholarships, fellowships, or traineeships to colleges, universities, and specialized schools be made available and increases in order to train qualified professional personnelteachers, doctors, nurses, psychologists, psychiatrists, social workers, educational, guidance, and rehabilitation counselors-so that they can have a better understanding of the educational, vocational, and rehabilitation implication of ocular defects and so that adequate service can be provided for the partially seeing.

(2) That Federal funds be allocated for financial assistance to colleges, universities, and specialized schools to include in their curriculums essential courses

dealing with the problems of the partially seeing.

(3) That Federal funds be alloted for the provision of inservice training seminars, intensive short-term training, and workshops for practitioners in the various disciplines as well as for administrators.

10. There is a need for extension of special educational supplies and equipment to service any partially seeing individual in need of some of the materials now provided by the Federal Government only for the legally blind.

It is therefore recommended

That any visually handicapped individual requiring special education, training, and rehabilitation should have available to him all existing materials purchaseable on quota account from the American Printing House for the Blind.

11. There is need for increased development, publication, and distribution of more books and equipment for all visually limited persons who use print, in order to provide equality of education for them.

It is therefore recommended

That the American Printing House for the Blind be encouraged to expand its facilities and be permitted to purchase from any established and reputable source books, machines, or equipment; and that the distribution quota of the American Printing House for the Blind be expanded to take care of all the needs of each State without regard to the present limitation of \$30 per capita.

Attendance List, October 27, 28, 1959, Hunter College

Edward Burke, Board of Education, New York City, Guidance-Visually Handicapped.

Leona Robinson, Vocational Education and Extension Board, County of Nassau. Sara Wasserman, Division of Vocation, Rehabilitation, New York City.

Helen Gibbons, National Society for Prevention of Blindness.

Walter S. Schachat, New York City Department of Health.

Charles R. Wallendorf, Vocational Education and Extension Board, County of Nassau.

Helen W. Fields, board of education, bureau for visually handicapped.

Mr. Elliott. At this time also, I would like to recognize the presence of Dr. Romaine Mackie. Dr. Mackie is the head of the Division of Exceptional Children of the U.S. Office of Education.

Dr. Mackie, to my knowledge, has spent these 2 days here listening

to the evidence that the committee has been privileged to hear.

We have been happy to have you, Dr. Mackie, and we appreciate your presence.

STATEMENT OF ROMAINE MACKIE, DIVISION OF EXCEPTIONAL CHILDREN, DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE. WASHINGTON. D.C.

Dr. Mackie. I do feel moved, Your Honor, Mr. Elliott, to express a word of appreciation. This is the first in the series of hearings, and I wanted especially to come here because of our interests in your work; also, because although New York is not my native State, in many ways it more or less adopted me and contributed some things to me for which I shall forever be grateful.

It began when Dr. Frampton provided me with a fellowship study at Columbia University, and it has provided me since then with inspiration from some of the students I had the honor of teaching in this city, two of whom were Dr. Gall and Dr. Connor, whom you heard.

I could not refrain from making these comments and to also assure you of the confidence you have placed in the Office of Education in the new fellowship program, concerning which many people are expressing appreciation to Congress. I refer to Public Law 85–926.

I also want to pledge the efforts of the Office of Education to try to

carry forward in the direction the people are indicating.

Thank you.

Mr. Elliott. Thank you, Dr. Mackie.

Did Lee J. Dowling come in?

Did Dr. J. Morrison Bradley?

Sylvia Golden?

Horace Mann?

Mr. Herman Melvin? I believe I was told he would not be here. Our next two witnesses will testify together. They are Dr. Gunnar Dybward and Dr. Elizabeth Boggs, representing the National Association for Retarded Children. We are very glad to have you with us.

STATEMENTS OF GUNNAR DYBWARD AND ELIZABETH BOGGS

Mr. Elliott. May I say that I distinctly remember the very fine work that Dr. Boggs and Dr. Dybward and their associates did, helping to create the climate, knowledge, and opinion that led eventually to the passage of Public Law 85–926, the bill for the teachers of the mentally retarded.

We passed that law on the last night of the 2d session of the 85th Congress, quite too late to obtain an appropriation for the bill for the first part of this year. But I am happy to say that in the recent session of Congress we did provide an appropriation of the full

amount authorized under the bill, with which to begin work under that law.

Having said that, Drs. Boggs and Dybward, I feel as though I am

taking your time, so I will let you proceed.

We have had a rule that we try to limit the testimony to the 30-odd witnesses we heard today to about 10 minutes. I think since two of you appear together the rule will be 15 minutes.

Dr. Boggs. We will try to do this in 10, Mr. Elliott.

We appreciate your patience in this prolonged hearing. I assure you I have no intention of reading what is in that red book, although I hope it may form a resource for your committee at a later date.

Mr. Elliott. Let me say that the full testimony of Dr. Boggs will be placed in and made a part of the record, following her whole state-

ment.

Dr. Boggs. We also included in that report the evaluation report we included for the White House Conference, because we felt it was relevant, but we don't expect to include that as part of the official testimony.

I would like to start by saying that 10 years ago there was no national voluntary citizen organization which was focusing on a comprehensive and continued look at the needs of the group we call the

mentally retarded.

The NARC has been organized since then, and has undertaken to apply itself in a broad way to a category of people which is as comprehensive. I think, as the one to which work groups 6 and 7 addressed themselves, and one where not only are there a great variety of individuals whose disability has been variously caused but also one in which, for any one individual, there are many aspects of disability.

In fact, the disability of mental retardation affects almost everything about the life of a retarded individual, from very early in his

life until the very end.

We feel heartened by the response that the community, community agencies, and governmental at all levels has shown toward the needs as expressed and focused upon by coordinating citizen interest, which we feel we are the vehicle to express.

I think it is important to express that because of its heterogeneity and because of the various aspects of the life of the mentally retarded, we find ourselves naturally drawn to work closely with a great variety

of other agencies.

To mention only two with which we have worked at the national level, and with which you are particularly concerned, the Council for Exceptional Children—the educational organization in the field of the handicapped—and the National Rehabilitation Association are among the people whom we regard as our organizational friends.

It has been said that if two men agree 100 perent, one of them is unnecessary. I think it would be very unhealthy if everybody agreed

on everything all the time.

But we feel that where are are disagreements in our field, these are the healthy kind which produce progress, and that to a remarkable extent various organizations, professional and lay, which overlap from various ways, have been able to arrive at very substantial agreement on many of the things with which you are concerned, and I think we

have shown our ability, our flexibility, in this respect, with regard to

suggestions with respect to Federal legislation.

One of the important things in my view, and in our view, about the response in the past 10 years of the community, both through voluntary agencies and through the tax-supported agencies, has been the extent to which it has enabled both the retarded individual and his family to come back to function in a way so that they can assume their own responsibilities with respect to this problem.

Previously, the individual who did not get help was submerged and the family often was overwhelmed and submerged and became, itself,

a social casualty.

All of these things have been improved by the direct services which have been made available, and these are services, of course, primarily not the direct responsibility of the Federal Government.

We have given a lot of thought to the role of the nonpublic agencies, the role of the various levels of government, and the role of the indi-

vidual in this whole picture, which is very complicated.
We do appreciate the activities of the Federal Government, which are designed to stimulate the States to do the things which the States ought to do. We feel his is so important nationally because in our highly mobile society what isn't done in one State often arrives in another State's lap at a later date as a dependent person.

However, I would like to stress particularly the important role of the Federal Government in professional training and research in these areas. I know you have heard this said many times in the past 2 days.

We can only say that we concur.

Both in the field of rehabilitation and in the field of special education we have relatively few Federal areas in the areas of respectively

professional training and research.

I would like to mention two or three specifics, and I know you are interested in that, too, where you might consider things to be done. For example, the cooperative research law has been determined to prohibit or not to allow grants to a residential institution which is caring for a large number, training and rehabilitating a substantial number, of mentally retarded individuals.

This happens to be precluded in the wording of the law, and yet these institutions are often the places where not only do you have the subjects for the experiment, but you have a concentration of qualified

personnel.

By the same token, the specific question of training people for research and education is not adequately covered. The cooperative research program does not provide for the training of personnel.

It provides for the conduct of research.

The expectation which we originally had of Public Law 85-926 was not realized when the term "for research" was amended out of that bill before it was passed.

I would ilke to underwrite and support the suggestion for the expansion of 85-926 to include other types of handicapped, other

than the mentally retarded.

We have been for this right from the start, although we recognize that in an experimental bill it was well to confine this to one area.

We believe that it would be very valuable, as has been mentioned by several other witnesses here, that flat grants to universities to get a new program of professional training established should be available to precede the granting of fellowships, tied in with the granting of

fellowships.

Finally, let me say that sometimes I think Congressmen worry a little too much about overlapping and duplication in the Federal offices in the Department of Health, Education, and Welfare. I think that we need a little bit more overlapping and what you should insist on is that the overlapping be productive and cooperative and not competitive.

Just in the areas that you are interested in, special education and rehabilitation, we need very close dovetailing. Sometimes by insisting that they not overlap, you prohibit them from even getting to-

gether, getting close to one another.

Now, may I turn this over to Dr. Gunnar Dybward for a few remarks.

Mr. Elliott. Thank you very much, Dr. Boggs.

Dr. Dybward.

Dr. Dybward. Mr. Chairman, it is a real privilege to appear before a committee that has given such splendid leadership in our field. I am very conscious of the time and I shall condense my remarks to a minimum.

Before I address myself to some of the specific problems in education and vocational rehabilitation, the focal points of your committee's activity, I would like to emphasize that much of what we will plan, are planning and have already accomplished in those fields, is to little avail if we do not have adequate diagnostic services in early childhood, long before the school or special education is coming to these children.

For that reason, I want to underline what has been said by some

of the committees with regard to this.

We certainly have been most grateful for what has been accomplished through the grants Congress has made to the Children's Bureau, in terms of establishing the special mental retardation clinics, but we have too few of them, and those we have are serving too large a territory, have waiting lists of them 6 months to several years, and at the same time we do have definite scientific evidence that at least in some of the cases of mental retardation very serious damage results if there is no early diagnosis, and with all of them there is an unnecessary delay which really spells deterioration, if we don't have very early, for the parents, an estimate of the child's capacity at that particular point, and some help in management and training.

We have now on record a study by Dr. Kirsch, of Illinois, which was published in the form of a book very recently, in which he has shown very definitely that preschool training for the mentally retarded child is a very wise investment and makes the general services of the public school through special education a far better investment.

This merely underlines the need for early diagnostic services. I would like to take just a minute to point out to you that we remain concerned about the limited services that the U.S. Office of Education can give, both by the limitation of its staffing, and by its rather unfavorable position in the echelons of the U.S. Office of Education, considering that 12½ percent of our schoolchildren are in the ranks of the exceptional children by reason of visual defects,

hearing defects, emotional and social problems, mentally retarded, and

others, altogether 5 million schoolchildren.

This office is woefully understaffed, and it is a very serious matter because as we develop new services it is of the essence that we have an office on the Federal level which can make available new knowledge to the States which can stimulate action, which can follow through, which can coordinate, and we feel very strongly that the very devoted and inspired service the staff has given so far certainly ought to be increased by addition, by strengthening of this particular arm of our Federal Government.

This is particularly necessary as we are developing better programs

in the field of vocational rehabilitation.

We now have several school systems that in some way or other on the secondary level are providing educational training for retarded

youngsters.

Here I come right back to what Dr. Boggs said, an ever-increasing need, for instance, for dovetailing between the public school services which, as I say, on the secondary level for retarded youngsters go into vocational training, some prevocational preparation, as a lead into the realm of the Office of Vocational Rehabilitation with specific sheltered workshops, vocational training, and programs, and so on.

Certainly for that we ought to have adequate staffing to bring about

the constructive dovetailing to which she referred.

I would like to make one brief mention about H.R. 3465, for which we are so grateful to you, Mr. Elliott, and would like to address myself

here only to title II, the independent living provisions.

Certainly we most definitely support the other provisions pertaining to workshops, rehabilitation facilities, and the evaluation services. But we feel that there is a need to stress the significance of this independent living part in title II.

We are aware that here you and your committee have really moved far ahead and are so considerably advanced that perhaps some people

are not yet fully understanding the significance.

We realize and we know that these provisions, of course, are not just dealing merely with the severely retarded, but with other severely handicapped, though we can speak perhaps more definitely about our own field.

We realize that so much of the knowledge that we have gained in recent years about the more severely mentally retarded is as yet not common knowledge even among professional people.

So we have a good deal of misunderstanding.

We feel, on the other hand, that the very interesting study Dr. Sanger did in New York State for the interdepartmental health resources board has certainly shown that in spite of what we have not done for mentally retarded, a large number of them, of the severely mentally retarded, do exist and do live in our community, and certainly with the services provided for in title II of H.R. 3465 we can do a great deal more for them.

We are convinced that we cannot limit ourselves when we speak of the worthwhileness of the economy of programs for the mentally retarded in the field of vocational rehabilitation, that we cannot limit ourselves merely to those where we actually get in sheltered workshops or on the job some productive results, because you also have to take into consideration the very considerable drain on family resources when the severely retarded are at home, either as full bed patients or else in a high degree of dependency, which calls for continual service

by the family.

If, under the provisions of this bill, and certainly we know that it can be done, a so-called permanent bed patient can get services which enable him to be ambulant, whenever another person through such services can learn to take care of his bodily needs, when a third person can learn to lessen his total dependency and become helpful around the house, this, while it cannot be spelled out in wages earned, nevertheless, means a very considerable relief to the family and very often a relief that can be estimated as a definite economic aid of the family.

We feel that the independent living provisions are of tremendous importance, and we do hope most sincerely that your committee will

continue to support them.

We are aware that there have been some questions about them, and we are also aware that there are still people who feel that the entire group which is referred to as trainable children and who formerly were characterized as with an IQ of under 50, really all should be lumped together as individuals who have severe limitations in terms of being helped.

We would feel very strongly that, through the independent living facilities, some individuals actually will be enabled eventually to move on into some public schooling; individuals who are particularly handicapped bodily, and this bodily handicap together with the

mental handicap is just too much for them at that moment.

But with help, through these services, this can be overcome.

For that reason, we feel that really H.R. 3465 will be as much a landmark for the severely retarded as the Public Law 113 of 1943 was a landmark in the development of the total services for the mentally retarded.

Thank you very much.

Mr. Elliott. Thank you, Dr. Dybward; and thank you, Dr. Boggs. We appreciate your testimony very much.

(The formal statements of the foregoing witnesses follow:)

TESTIMONY OF DR. ELIZABETH M. BOGGS, PRESIDENT, NATIONAL ASSOCIATION FOR RETARDED CHILDREN, INC.

THE NEEDS OF THE MENTALLY RETARDED

Special education and rehabilitation services are central to the interests of the National Association for Retarded Children, which devotes itself to promoting the welfare of America's estimated 5 million mentally retarded citizens of all ages and all degrees of disability, wherever they may be. The condition of mental retardation originates before, during, or soon after birth and, once established, cannot be cured in a medical sense; it can, however, be ameliorated by training and by appropriate manipulation of the environment, especially during the formative years—hence our deep concern with the purposes of the current study.

The mentally retarded person is a citizen with certain special needs; he is also a citizen with rights as an individual and as a member of society. Too often in the past we have spoken grandly of "all children," but in a footnote have made an exception of the mentally retarded child. He, too, must have access to "opportunities for children and youth to realize their full potential for a creative life in freedom and dignity," along with all the others for whom this theme is being invoked during 1960 in connection with the Golden Anniversary White House Conference on Children and Youth. Likewise, the mentally retarded

adult must be given the opportunity to find his niche in the social and economic life of the Nation to the extent of his ability, and must be offered that measure of protection, ranging from slight to maximal, which the degree of his disability warrants.

As to all children and youth, society's first obligation to the retarded youngster is to strengthen him physically, emotionally, intellectually, and spiritually to the fullest possible extent. We do this out of our democratic respect for the worth of each individual, and we do it out of our conviction that no human resource should be wasted and no individual considered expendable.

THE ROLE OF THE FAMILY

In the National Association for Retarded Children we have given much thought to the mutual responsibilities of the retarded individual, his family, his community, and his government.

The duty of the retarded child and adult is simply stated: It is to do his best to use the opportunities presented to him, to learn from the world about him, to care for himself, to respect the rights of others, and to make whatever contribution he can to the general weal of family, community, State, and Nation.

We in NARC also believe firmly in the same family responsibility to the handicapped child as to the normal child. We believe, however, that this responsibility can only be properly discharged in an atmosphere of community acceptance and with the aid of community-sustained services—services some of which will parallel those available to all families and all children, and some of which must, by the nature of things, be of a special character. To the family of a normal child there is available today, as a matter of course and a matter of right, the supporting efforts of churches, schools, health services, community recreation programs and the like. Yet even these common social benefits have frequently been denied to the retarded child and adult and his family. In the area of special services, society's efforts have been spasmodic, ill planned, incomplete, and, hence, doubly costly.

THE ROLE OF THE VOLUNTEER AGENCY

In a free society, citizens have a responsibility to help themselves and each other; the volunteer agency has become the vehicle for such citizen action.

Through its 700 local member units, banded together in 47 State associations, NARC is providing direct services to many thousands of retarded children and adults. These services include diagnostic clinics, parent guidance, nursery schools, day-care centers, day schools, day and resident camps, swimming programs, teenage canteens, vocational counseling and placement, vocational and social rehabilitation centers, sheltered workshops, activity groups for severely retarded adults, and volunteer services in institutions. (More than half the sheltered workshops for the retarded in this country appear to be operated by units of NARC, who act as agents of the State and Federal program.)

NARC has also stimulated hundreds of other agencies, public and private, to assume their own proper responsibility for similar services to the retarded. We regard our direct services in most cases as demonstrations—a way of showing that there are retarded children and adults not now being served and that they can be helped. Ours is also an emergency service; time is running out for many youngsters, while legislators debate and school boards hesitate.

The voluntary agency has the opportunity to lead the way, to respond quickly to newly felt needs, to experiment and demonstrate, to make patent the areas where Government action will be required.

THE ROLE OF GOVERNMENT

What then is the role of Government? Fundamentally we would feel that there is an obligation on each agency of Government to provide to the mentally retarded those services they need which the agency has already been mandated to provide for all children and adults. Let the concept of free public education for "all the children of all the people" include the mentally retarded child. Let aid to dependent children not exclude aid to the dependent retarded child. Let the crippled children's commission know that the crippled retarded child is no less entitled to physical or speech therapy. Let the public health nurse be no

less concerned that the retarded child be immunized, well nourished, or promptly hospitalized. Let the rehabilitation agency think also in terms of a prosthesis for the mind. Let it also not refuse its services to the eligible residents of public institutions for the mentally retarded. And, last but not least, let the employment agencies extend their staffs and services to provide for the mentally re-

tarded, qualified to seek jobs on the open labor markets.

Above and beyond the recognition that the handicapped is a person and a citizen, Government has a responsibility to take cognizance of the special impediments characteristic of the handicapped. From the point of view of the individual and his family it is right that some share of the burden of extraordinary misfortune should be lifted through social action, through service rendered at common expense. Of equal importance is the obligation of Government to advance the common welfare by contributing to the prevention, where possible, and to the mitigation, in any event, of all forms of disability which impair social usefulness or lead to dependency. It is this latter principle which has provided primary justification for the entire remarkable State-Federal vocational rehabilitation program. We endorse the extensions of this principle incorporated in the pending bills on rehabilitation (H.R. 3465 and S. 772) and urge that the language of these bills be clarified so as to insure that the intent covers the more severely mentally handicapped.

Recognizing the dual-faceted responsibility of government to concern itself with the handicapped individual as a person, and as one whose special problem is a social concern, we may address ourselves to the proper division of the responsibility as between local (or county), State and Federal levels. Most students of government seem to accept the thesis that services should be rendered at the most immediate (lowest) level at which they can be efficiently performed. In this country direct services, even to the handicapped, are rarely rendered by the Federal Government. The distribution within any particular State of this responsibility for direct services, through schools, vocational counseling, hospitals, etc., will reflect localized socio-economic, political, and historical factors.

and is of secondary concern to this, your committee.

The responsibility of the Federal Government for service, while indirect, is nevertheless, highly significant. In an age of high mobility the Federal Government must, of course, be concerned that a certain minimum level of dependency prevention be practiced in all States lest those States which address themselves conscientiously to this subject inherit the human and economic costs of those who do not. Stimulation of State government agencies to the proper performance of their direct service tasks has become in the last decade or two a particularly significant and proper part of the Federal program, especially in the fields of health and welfare. Again the vocational rehabilitation program is an excellent case in point.

The proper relation of the Federal Government to the State-controlled public school system has been the subject of controversy. On the general question of Federal aid to elementary and secondary education we take no stand, except to say that whatever form such aid may take should assure that the exceptional child is by it no less well-served than the normal. Our position on the subject of eligibility for Federal surplus property is an example. The U.S. Office of Education in its accepted role must serve the handicapped as well as the average child. It is imperative that the Commissioner of Education and the Section on Exceptional Children and Youth be better equipped to carry out obligations to special education. Our executive director, Dr. Gunnar Dybwad, will address himself to this concern.

PROFESSIONAL TRAINING AND RESEARCH

A more direct role for the Federal Government in promoting opportunities for professional education in professions where shortages threaten the well-being of the Nation has now been established, and, in recent years, extended with wide-spread popular and congressional support. Likewise the cognate function of research has been recognized as an activity in which the Federal Government is a proper partner. There are aspects of both activities which by their nature transcend local boundaries and yield only to national leadership. In the last 5 years the Congress has thoughtfully made available both to the Office of Education and to the Office of Vocational Rehabilitation funds for research and

professional training pertaining specifically to education and rehabilitation of the mentally retarded. These programs are quite new and it is to be expected that there must be a period of administrative experimentation in determining the optimum manner in which these funds may be deployed to accomplish the

purposes intended by the Congress.

In the Federal vocational rehabilitation program, the research and training programs are generic to the entire field of the handicapped, and we must be peak our appreciation both to the staff of the OVR and to the Congress that the mentally retarded have in recent years begun to come into their own within this larger context. In the cooperative research program of the Office of Education also we find a needed emphasis on the mentally retarded, coupled with grants pertaining to other areas of exceptionality as well as to education in general. Only in professional preparation in the field of education do we see a statutory emphasis placing undue restriction on a subject area. Here your committee may wish to consider further statutory changes; in line with the position which we have taken throughout the history of the passage of Public Law 85-926 (for which we are so grateful to several members of this very committee) we respectfully submit that as soon as adequate experience with the present 1958 statute has provided a basis for evaluation, the legislation should be extended to cover the preparation of personnel qualified for advanced work and leadership in other branches of special education, more particularly the education of the physically and neurologically handicapped and the emotionally disturbed.

The act Public Law 83-531, in which the cooperative research in education programs is being carried out, does not explicitly provide for the training of personnel for research in this field, nor does Public Law 85-926. This is a defect which should be remedied since we can soon exhaust our scant reserves of

qualified investigators in these fields.

Another defect in the language of the cooperative research act stems from an understandable but regrettable lack of appreciation of the role of the residential school and institution in the network of special education and rehabilitation. These facilities—and for the mentally retarded alone there are currently 103 public residential institutions—offer certain unique opportunities for both research and professional training, as well as for direct service. It should be possible for such institutions, if equipped and qualified, to apply for and receive Federal grants for research and, where appropriate, for professional training, in any relevant subject area, especially where the benefits of such activities can be expected to benefit significantly the handicapped beyond the borders of the State in question. There is reason to believe that latitude in selecting the recipient institution allowed in the State governing the NIH programs, is best suited to accomplish the basic missions in professional development and research.

What we have heard in attending hearings conducted by this and other committees and what we have inferred from conversations with Congressmen leads us to believe that congressional intent in respect to professional training and research, does focus, as we believe it should, primarily on doing those things which the States cannot severally do for themselves, rather than on those things which some States have heretofore failed to get around to doing. hope that the Congress, in reviewing these programs in the future, in modifying them through increased but selective appropriations, and in encouraging the executive branch, will continue to make clear that both in research and in advanced professional training a long-range approach is needed. The needs of these two areas must be viewed in national perspective; the resources of the Nation must be marshaled and cultivated in those places where they can best flourish. Potential leaders in the field must be selected from among the most gifted candidates regardless of geographic origin. They must receive the most rigorous, most modern, and most inspired preparation wherever available, and then must be most rapidly deployed across the Nation to the points where they are most needed.

Through efficient Federal participation in programs of professional training and research in the fields of special education and vocational rehabilitation we can do much to rescue the handicapped, of which the mentally retarded constitutes such a major portion, from personal futility and social dependency.

To do so is to serve the national interest.

DECADE OF DECISION-AN EVALUATION REPORT PREPARED BY NATIONAL ASSOCIA-TION FOR RETARDED CHILDREN, INC., FOR THE 1960 WHITE HOUSE CONFERENCE ON CHILDREN AND YOUTH

I. PREAMBLE

The year 1960 will be celebrated as the 10th anniversary of the National Association for Retarded Children. The birth and rapid growth of NARC is thus in itself one of the phenomena peculiar to the decade under review; it is a phenomenon which significantly affects the lives of the nearly 2 million children and youth of the United States who are mentally retarded in greater or less degree.

NARC has been both a producer and a product of changed attitudes toward mental retardation. It was created to promote the welfare of the mentally retarded of all ages and degrees of handicap wherever they might be and to develop the means of preventing this condition in children of the future. It is the only national voluntary citizen organization espousing these objectives.

II. HOW NARC CAME INTO BEING

The movement on behalf of retarded children had its slow beginnings in the mid-1930's with the formation of a few localized groups in Ohio and Washington. The national association was organized in September of 1950 when 40 individuals, representing local associations in 13 States, assembled in Minneapolis and adopted a constitution under which the National Association of Parents and Friends of Mentally Retarded Children came formally into being in February 1951, after ratification by the first 20 existing local associations. Despite differences in organizational structure and immediate goals these preexisting groups were impelled by their basic common purposes.

By the time of the 1951 convention the following October, 57 local associations had adhered to the new federation. By September 1959, the organization had grown to 700 local member units distributed in 49 States (Alaska being the only exception) and having an individual membership of approximately 50,000 individuals. State federations have been formed in 46 States. Of the 170 standard metropolitan areas listed by the U.S. Census Bureau, only 11 are not directly served by 1 or more units of the NARC. Hundreds of smaller associations reach out into the farm communities of Iowa and the mountain valleys of Idaho and upland California and the outlying islands of the Hawaiian Islands. Member units have also been formed in oversea military installations.

Comparable organizations are developing apace in most of the countries of the British Commonwealth and in Norway, Sweden, Denmark, Holland, France, Switzerland, Israel, and Japan. An international federation is almost certain to be formed within the next decade.

III. WHY NARC AT MIDCENTURY

In view of the stress being laid by the 1960 White House Conference planners on social, cultural, and economic changes, it may be appropriate to explore here briefly the question, "Why did a parent-inspired national voluntary movement in behalf of America's retarded children and adults emerge when it did?" The half century between 1870 and 1920 was, in fact, a fertile one both scientifically and socially for the mentally retarded. The first public school class for the mentally retarded was opened in Providence in 1896, and the special class had become an accepted and established part of many of the major city school systems by 1920. Residential institutions for care and training were established or expanded in many States during the same period. The scientific study of the behavior of the mentally retarded fluorished. Partly because of the high mortality of the most severely handicapped, scientific and social attention focused particularly on the mildly retarded. Both science and society "discovered the moron" in the year of the first White House Conference but whereas science reacted on the whole with constructive curiosity, society, on the other hand, tended to react with something less than constructive anxiety to the new "menace", an anxiety which resulted in ill-founded enthusiasm for programs of segregation and sterilization. The schools, however, remained faithful through the third decade, and programs continued to spread. This era appears to have come to its climax in 1930 when the rights of the handicapped child to education

were set forth in the voluminous publications of the 1930 White House Conference, whose findings were still being quoted in college lecture halls 25 years later. Even such dedication was not proof against the combined effects of the depression and the staggering increase in total school population of the 1930's From the mid-1930's on, enrollment of mentally retarded pupils in special classes declined not only absolutely, but also proportionately until the late 1940's.

Somewhere along the line also, the inclusiveness which had characterized the school programs of the first quarter of the century began to be modified. Sometimes by law, sometimes by interpretation, sometimes just by gentlemen's agreement among administrators, special classes for the mentally retarded began to be restricted to those defined as "educable," usually designated as IQ

50 or above.

Soon also, child guidance clinics established earlier in a number of States, primarily for the purpose of helping the mentally retarded, began to turn their attention away from the retarded favoring now the emotionally disturbed, for whom the new psychiatry seemed to offer more results. The edge began to

off the hope of the first quarter century.

In the meantime the hospitals, the obstetricians, the pediatricians, and the other maternal and child health workers had been collaborating to produce spectacular reductions in infant mortality. The introduction of antibiotics immediately following World War II saved additional young children from respiratory and gastrointestinal diseases. These improvements in public health appear to have differentially favored children with congenital handicaps such as mongolism. These trends, superimposed upon the high postwar birth rate, brought us to the opening of the second half century with a significantly larger number of young, severely mentally retarded children, both numerically and proportionately, than at any time in our previous history.

The majority of these more handicapped youngsters were "trainable," i.e. capable of profiting by a modified program of group instruction slanted toward goals of social adjustment and the development of language and manual skills. Yet, with the exception of three or four isolated cities and a few smaller communities, these children were being rejected right and left by the public schools.

Parents of those who were too severely retarded or had complicating disabilities precluding classroom participation were being almost universally advised by physicians to place their children in residential facilities only to find that thousands of other children were already enrolled on waiting lists ahead of them. Because of the high costs of long-term residential care, 90 to 95 percent of families must seek it in a public institution. Parents whose children had secured admission to one of the State-operated "schools" or "homes" housing anywhere from 500 to 5,000 individuals of almost all ages, were often shocked at the overcrowding, understaffing, poor maintenance, minimal food, and unsanitary conditions not to mention the enforced inactivity of the majority of "patients" which did nothing to enhance the "freedom and dignity" of the handicapped child and little more for those who, in spite of everything, might be struggling to care for him.

War, depression, and, paradoxically, modern medicine had conspired to bring about an acute multifaceted social crisis to which the social response was the formation of a community-based, State, and nationally coordinated movement. This movement, on behalf of the "forgotten children," already somewhat overdue, having been itself inhibited by conditions prevailing between 1935 and 1945, flowered readily in the relatively more favorable environment of the last decade. Perhaps it was not coincidence that it was born in the year of the midcentury White House Conference, with its emphasis on citizen participation. Although still relatively modestly financed, especially in relation to the size of its task, when compared with other major voluntary health and welfare organizations. NARC has, nevertheless, come of age and come to stay in 9

breathless years.

IV. RELATION OF NARC PROGRAM TO CONFERENCE THEME

By focusing on "opportunities for children and youth to realize their full potential for a creative life in freedom and dignity" the national committee has focused on an issue which is not only germane, but central to the interests to NARC, most of whose activities are directed toward creating such opportunities for the mentally retarded.

1. Values and ideals

Our society is not always entirely consistent in applying its values and ideals to the mentally retarded. On the one hand, we affirm the value of each individual, his right to individual fulfillment and to a useful social role in accordance with his abilities; on the other hand, stress is placed on economic and scholastic achievement, physical agility, and perfection in competition in feats in which the mentally retarded can seldom emerge triumphant. We are still asking the retarded child to value himself and value a society which too often devalues him. ("Why should we spend money on the retarded when we are not doing enough for the gifted?" or, "Of course the retarded youngsters should have their school, but not in our neighborhood.")

2. Effects of change

By the very nature of his handicap the retarded child is slow to adapt to changed circumstances, sometimes slow even to perceive that they have changed. The problems presented by mobility, urbanization, uncertainty as to acceptable mores, may all confront the retarded child in exaggerated form. Two characteristic effects are worth special mention: (a) since the retarded individual must be prepared more explicitly for his occupational future, he will be especially vulnerable to changes in the structure of available employment to the extent that these cannot be foreseen by his teachers; (b) servicemen's families and other highly mobile parents are confronted with a particularly difficult task of providing continuity of programing for their handicapped children and also of securing those services to which there are residence laws applying.

3. Personal and environmental influences

Since with present knowledge little can be done to cure or treat the condition of mental retardation once established, it is to the manipulation of personal and environmental influences on retarded children and youth that the NARC directs a major part of its program, which will be analyzed according to the suggested components in the following section.

V. THE NARC PROGRAM 1950-60—PART A: "TO PROMOTE THE WELFARE OF THE MENTALLY RETARDED"

It may be worth noting that NARC's program of service to the retarded has changed shape somewhat in the decade; it started out as comprehensive but somewhat elliptical, polarized around the two focuses of needed day schooling and equally needed residential care facilities. By 1954 it had become decagonal, with the emergence of a 10-point plan, but by 1958 it had taken on the holistic

simplicity of a well-rounded program.

In any case, mental retardation being all pervasive in its influence on the life of the individual, the mission of NARC encompasses the family, religion, health, education, recreation, welfare, law and government, work, and guidance. A definitive evaluation of the accomplishments of the last 10 years and tasks yet to be accomplished in each of these areas would require a volume. The more there is to be done the less time there is to write of it. Therefore, only selected highlights are outlined below, as indicative of trends. These have been chosen without regard to the wellsprings of action. NARC may serve directly or it may serve as well by creating the environment in which others may achieve; it is to the program objectives rather than authorship that we address this evaluation.

A. The family

Accomplishments for the family.—1. Physicians' advice: Reports from parents at the time of the formation of NARC, while not quantifiable, indicate that it was common practice among physicians at that time to couple a diagnosis of mental retardation with advice to institutionalize the child promptly. This advice was often given without consideration of its practicabilty or of the responsibility of the parents to evaluate and decide for themselves. One of the hopeful signs of the last decade has been the increasing frequency with which articles have appeared in professional journals, including medical journals, advocating a more individualized approach and in particular inveighing against advice to institutionalize in infancy or early childhood except in extraordinary circumstances

2. Diagnosis and guidance: The family who suspects one of its children of being mentally retarded needs a comprehensive coordinated evaluation of the medical, psychological, social, and educational factors, interpreted to the parents in language and at a pace they can understand, coupled with practical suggestions for the care and training of the child related to actual, available resources. To be properly effective such a service must be rendered by specialists who have a major interest in the retarded child and a specialized knowledge of his problems. There is not known to our association any facility in existence prior to 1949 which met all of these criteria. The development of such clinical facilities in the past decade is indicated by the following:

	Num of cl	nber
Date:	1949	
	1955	
Ton 1		70

The first clinics were initiated for the most part at the urging of local associations for retarded children, but the second and more difficult half of this development owes much to the special grant program of the U.S. Children's Bureau.

3. Parent education: In 1950 a most serious problem facing parents of retarded children was the lack of helpful information on the problem of mental retardation and particularly on home care and management. Since then many communities have developed parent education programs. In a recent survey NARC found a distinct trend toward parent-motivated discussion groups (as opposed to lectures), with 44 out of the 75 programs providing for series of 6 or more meetings.

4. Parent education literature: The editor of a reading list for parents in 1950 found only two pamphlets (one of them Canadian) and one chapter of a book addressed directly to the parents of retarded children. NARC's 1959 revision of "Windows of Understanding," its reading list for "new" parents, lists 18 books and pamphlets written expressly for parents of the retarded, together

with 5 book-length, first-person stories.

5. Studies of family living with retarded: Although in 1950 brief generalized statements in psychiatric textbooks about the disintegrating effect of a mentally retarded child upon his parents and siblings were quite common, no substantial research had been done on this problem. In 1959 a monograph based on a 3-year study entitled "Effects of a Severely Mentally Retarded Child on Family Integration" was published, which among other things indicated the inappro-

priateness of unqualified generalizations.

6. Peer groups: Increasingly, reports received from NARC State and local units, reveal the role being played by normal youth in molding the environmental influences on the retarded young person. Youthful volunteers help to staff day and residential camps, participate in teenage canteens for the retarded, help to raise funds, write term papers, or give talks before social studies classes and finally elect careers of service related to mental retardation. There is no doubt that these young people, shorn of prejudice as they are, or as they become, bring to the retarded with whom they come in personal contact a particular kind of reassurance.

Tasks ahead in relation to the family.—1. Bringing comprehensive competent

evaluation and guidance services to parents in rural areas.

2. Modifying the content of outdated high school texts in social studies, which by purveying unscientific ideas prejudicial to the mentally retarded, not only cause pain to their adolescent siblings, but also sow the needs of unnecessary shock and shame for those youth who will shortly become the parents of the mentally retarded children of the next decade.

B. Religion

Accomplishments in the field of religion.—In 1952 NARC sought from the major national bodies concerned with religious education of children, help and guidance in providing suitable instruction for the mentally retarded of varying degrees of intellectual limitation. Little or nothing was to be had. By 1959 we find throughout the country hundreds of classes through which Roman Catholic, Protestant, and Jewish children are instructed in the essential truths of their faith. The National Catholic Education Association established its department of special education, and the National Council of Churches issued several publications stressing the churches' responsibility to the handicapped, including the

mentally retarded. Institutes for religious teachers and for clergymen have been held in various parts of the country; books are appearing in which the role of religion in the life of the retarded child and his family are discussed, new day and residential schools, usually nonsectarian in admission policy, are being organized under Roman Catholic, Lutheran, Presbyterian, Episcopalian, Jewish, and other ausuices.

Tasks ahead for religion .-- 1. Development of really appropriate instructional

materials for use with mentally retarded children.

2. Better preparation of clergymen of all faiths to meet the spiritual needs of the families of the retarded.

Cooperation of the religious bodies and government in meeting more adequately the religious needs of the institutionalized retardate.

C. Physical health

Accomplishments in physical health.—1. At the beginning of the decade children with orthopedic handicaps who were also mentally retarded were frequently excluded from crippled children's services. Substantial improvement has been noted. (More precise documentation is available from U.S. Children's Bureau.)

2. Pediatric internships in facilities caring for the mentally retarded have

substantially increased during this decade.

- 3. In 1950 there were few dentists prepared to accept and treat a severely involved mentally retarded child who could not cooperate. Extraction was often the only kind of dental treatment offered. During the past 10 years special institutes for dentists have been held and a number of specialized dental clinics established.
- 4. Public health nurses have become increasingly aware of the role that they can play in assisting the family of a young mentally retarded child to train him in feeding, dressing and toileting.

5. A conference on nutrition of the retarded institutions was supported by

the Children's Bureau.

Prevention of brain damage by early intervention with special surgery, special diets and other means is becoming recognized as a responsibility of the physician.

Tasks ahead in physical health.—1. While certainly diminishing, there is still a substantial number of physicians who consciously or unconsciously reject the retarded child, as a patient whose physical well-being is not fully worthy of their

attention. This is probably a matter of medical education.

The handling of the severely retarded child who is hospitalized has been little studied and the insecurity of nurses faced with this problem often compounds an already difficult situation.

D. Mental health

Accomplishments in mental health.—1. Probably the most significant contribution to the mental health of the mentally retarded child has been made by NARC itself through public education and through the opportunity which it affords to parents to associate together and share experiences. The self-respect and selfconfidence thus engendered in parents, together with the provision of practical services by the communities, local and State, made possible better overall mental

health for the mentally retarded.

2. In 1950 mentally retarded individuals, even of the higher ranges of intelligence were frequently rejected for treatment by mental health clinics and private practitioners on the assumption that they could not benefit by psychotherapy. During this decade these attitudes have substantially changed, as evidenced by the wide circulation of such books as "Psychological Problems in Mental Deficiency" (Sarason) and "Counseling and Psychotherapy With the Mentally Retarded" (DeMartino). (In 1957 the regional office for Europe of the WHO sponsored a 10-day seminar devoted entirely to the mental health of the mentally subnormal child.)

Tasks ahead in mental health.—1. Although mental deficiency has been traditionally assigned by medicine to the domain of psychiatry, few psychiatrists are

adequately trained in the intricacies of this complex field.

2. The frequent categorization of mental retardation as "a mental health problem" by laymen and professionals alike, has inhibited other specialists from recognizing and assuming their proper responsibilities. (Example, a State department of health which replies to a questionnaire on its services to the mentally retarded by stating categorically that the State department of mental hygiene "takes care of everything.")

E. Education

Accomplishments in education.—Short of primary prevention, education offersthe greatest hope for the mentally retarded. Progress during this decade has been spectacular.

1. In 1949, 24 States and the District of Columbia had State legislation providing for special classes for the mentally retarded in the public schools. In 1959, 48 States and the District of Columbia had such legislation. (States without legislation are Arizona and Alaska, of which the former had classes in

several major cities.)

2. In 1950 no State had laws specifically encouraging local districts to provide for the "trainable" mentally retarded (roughly characterized by IQ 25 to 50), although a few States tolerated and even subsidized such local classes as might be initiated by local school boards under general, broad-purpose legislation. By 1959, 20 States had specific mandatory or permissive legislation under which such children are provided for in the local public schools. An additional 17 States by administrative regulation or interpretation sanction such classes as being authorized under more general laws.

Laws do not create classes by themselves, however. The following table gives a rough gage of progress.

Public school enrollment of mentally retarded in special classes

	1940	1948	1953	1958 1
Educable	(2) (2)	(2) (2)	109, 903 4, 662	
Percent of total public school enrollment	98, 416 0. 38	87, 030 0. 36	113, 565 0. 39	

¹ To be filled in from USOE figures about to be released.

3. During the decade an important study of teacher preparation was made by the U.S. Office of Education. It revealed that in 1954 40 colleges and universities were offering a sequence of at least 3 courses including supervised practice teaching to prepare teachers of the mentally retarded. Since then the number of such curriculums has substantially increased and summer sessions have become very widely available indeed.

4. An analysis of the current and projected need for teachers of the mentally retarded was made by NARC in 1956 and submitted to the congressional committees considering the bill which, in 1958, became Public Law 85-926, and has now been activated by means of an appropriation. Its purpose is to encourage expansion of education of mentally retarded children through grants to institutions of higher learning and State educational agencies to improve and increase the training of personnel.

5. Extending school programs accentuates the need for further research in techniques and substance of education for the retarded. The inauguration of the cooperative research program under the U.S. Office of Education in 1955, with the earmarking of a substantial fraction of the funds for research in the education of the mentally retarded, is another significant accomplishment of this decade.

6. Nursery schools for preschool children and day care centers for children too severely retarded to qualify for program of public school instruction are part of the larger education picture designed to permit each mentally retarded child to achieve his full potential, however limited. NARC is currently surveying the rapid developments in this field.

Tasks ahead in education.—1. Finding more effective ways of reaching the extremely severely retarded child on an individual (nonschool) basis.

Better financing of special classes in States which have been slow starters.
 Greater reciprocity among States in teacher certification standards, which in turn would imply a raising of the standards in many States.

4. Improved coordination between education and vocational rehabilitation agencies in preparing the mentally retarded for the world of work.

5. Emphasis on quality in teacher preparation based on depth and breadth in this special competence on the part of college faculty members.

² Not differentiated.

6. Better orientation of education administrators to the goals and uses of the special class.

F. Recreation and the arts

Accomplishments in recreation and the arts.-1. So far as is known the first summer day camp for mentally retarded children was organized in 1950. By 1955 there were 55 such day camps; in 1959, 150 were reported. A number of residential camp programs have also been established.

2. A cooperative effort between NARC and the National Recreation Association revealed that between 1954 and 1958 the number of recreation programs, such as summer playgrounds, teenage canteens, and swimming activities, spon-

sored by municipal public recreation departments at least treble.

3. A manual on swimming for the retarded was prepared in cooperation

with the American Red Cross water safety director.

4. Although Boy Scout troops in residential institutions date back to the late twenties, it is believed that the first troop of retarded scouts in the community was formed in 1950. Now 150 troops of mentally retarded boys (including cubs) are registered with the Boy Scouts of America. Comparable advances in girl scouting are recorded.

5. In the spring of 1959 a Milwaukee museum devoted an entire exhibition

to art of the mentally retarded.

Tasks ahead in recreation and the arts.—1. Orientation of recreation workers and directors to the place of the retarded in community recreation programs, and particularly to the factors which determine the extent to which any particular child should be integrated with or segregated from normal children in group activities.

2. Research on safety in recreation for the retarded—in design of equipment

and of activities.

3. Analysis of recreational activities and needs of retarded adults of various levels as a guide to the recreation skills and presences which they should be encouraged to develop as children.

4. Development of recreational activities appropriate to very severely retarded

children in the home, in community centers, and in institutions.

G. Welfare

Accomplishments in welfare.-1. Casework: Perhaps no where more than in the field of welfare have we seen the philosophy of segregation of the retarded reflected, not merely in arrangements for his physical isolation but also in the administrative structures of State and local government. It seems that the retardate must either be capable of being treated as a "person" whose problems can be dealt with by a welfare worker with a "generic" approach, or else the agency should wash its hands of him and turn him over to "the people in charge of institutions." If the institutional agency finds it either undesirable or impossible to institutionalize the child, it will presumably have to set up its own foster home or other supervisional program. With the outstanding exception of Minnesota, whose community program for the retarded was born within its child welfare services 40 years ago and managed to survive the dark ages of the second quarter century, the attitude of "let the institution do; it's their job" seems to have been prevalent in child and public welfare agencies, wherever substantial services beyond financial grants were seen as necessary. It is therefore significant that, during the last decade-

A specialist in mental retardation was placed on the staff of the child

welfare section of the U.S. Children's Bureau.

The Children's Bureau initiated a study of the prevalence of mental retardation in the case load of public welfare agencies.

The National Conference on Social Welfare of 1959 included four sessions dealing specifically with problems of the mentally retarded.

A number of caseworkers have publicly deplored the inadequacy of their professional orientation toward problems of the retarded.

2. Social security amendments: Of great importance to the dependent retarded youth and his family were the 1956 amendments to the Social Security Act which extended survivors' benefits to a permanently disabled child beyond the age of 18.

3. Residential care: State governments are now paying over \$200 million a year for the care of approximately 150,000 mentally retarded or epileptic individuals in public institutions. In 1950, 46,000 or about 37 percent of those

then in institutions were under 21; the proportion as well as the gross has undoubtedly increased in the past decade, since a general trend to earlier admissions of more severely retarded children has been noted. Between 1950 and 1957 public institutional capacity for the retarded increased by approximately 10,000 beds. Although accurate statistics on waiting lists on a nationwide basis are not presently available, it appears that new building has merely kept up with demand without substantially decreasing the backlog. (At middecade there were between 10,000 and 15,000 retardates awaiting admission.) Space is most acutely needed for severely retarded young children at the present time. Although some 17 new institutions were created during the decade (with 6 more on the boards), leaving Nevada and Alaska as the only States without separate State operated residential facilities for the retarded, too much of the new capacity was achieved by enlarging already overly large institutions.

There has been considerable experimentation with building design. State sent its architect, a professional educator, and a member of the legislature on a nationwide tour to look at new buildings and consult with those administering residential programs, prior to drawing up plans for a new institution. Despite interest and talk, however, basic philosophical concepts are still confused; there is still inadequate differentiation between the needs of the higher grade individuals for whom the institutional training program is a way station on the way back into society, and the severely retarded for whom it may have to be a permanent way of life; there is inadequate communications between architects, superintendents, people who actually work in the buildings, and experts in heating, lighting, mass feeding, communication systems and other specialists in the logistics of the physical management of institutions. perintendents are usually physicians or educators.) Ways in which building design can minimize housekeeping and thus maximize the amount of time that attendants can spend caring for the social and emotional needs of children have not been fully analyzed.

Programing has undoubtedly improved in the majority of institutions, although not spectacularly, during the decade. Of the approximately 27,000 educable and trainable children of school age in residential institutions in the early part of the decade, only about 22 percent were enrolled in educational programs, notwithstanding the fact that the opportunities for education are often held out as a principal argument for removing such children from their homes. For comparative figures we must await the 1960 national census, but one can infer, from such indirect information as the increase in the number of teachers employed by institutions, that educational programs therein are being expanded. Recreational activities are also improving, as have medical and psychiatric

care and social service.

Relations with parents, individually and collectively, have undergone significant and recognizable changes in most States. Most institutions for the mentally retarded have been primarily "open institutions" in the sense that they are not walled or barred. (There are some deplorable exceptions.) Today, however, they are opening inward as well as outward as the frequency of visiting by parents and citizens increases. The development of volunteer service programs within institutions for the mentally retarded constitutes another important advance during the decade.

The period 1950-60 has seen the advent of both tranquilizers and TV in most institutions, on the whole for the better, although not without certain attendant

hazards for those who mostly sit and wait.

The decade has also seen considerable agitation for the reform of the various State systems of charges to parents for the care of their minor and adult children in residential institutions. Whereas most States admit any eligible child to a school for the blind, deaf, or delinquent without charge either for tuition or maintenance, in all but four States, parents are expected to pay "in accordance with their ability" up to full per capita costs for all services including education, recreation, etc. In most cases the obligation continues for life and in some States liens accumulate against the parents' estate for the difference between the maximum charge and the actual payment. Leaving aside inequities and inaccuracies in the actual administration of these laws, the basic "values and ideals" on which they appear to be based certainly require some clarification. The discrepancies are accentuated even more when one notes that in most States a parent responsibily desiring to have his child admitted to a State institution must have an order of commitment by a court, which substantially transfers legal custody if not actual guardianship to the State and leaves the parent few

legal rights in determining his child's future from that point on. At the present time the "pay plans" have been recently revised or are under active review in at

least eight of the larger States.

4. Private institutions: Although there are about 200 private residential homes and schools for the retarded, housing from 5 to 500 children and adults each, these institutions account for only about 5 percent of the total institutionalized retarded population. Standard setting and accrediting of such institutions often falls in the no man's land between health, welfare, mental health, and education agencies. NARC is currently conducting a survey among the States to determine how many States have a licensing and inspection service, in what agency it is lodged, and what types of standards are used.

5. Community planning: The advent of the well-rounded or multiphase program brings with it a responsibility for local and State planning bodies, voluntary as well as official. It is heartening to note that in cities as widespread as Los Angeles, Miami, Richmond, and Chicago, for example, the local council of social agencies has initiated an objective look at the totality of services available from specialized and general purpose agencies to the retarded children, youth,

and adults of its community.

Tasks ahead in welfare.—1. Action on the problem of management of the defective delinquent: The three States which have done substantially more than wring their hands about this problem (Massachusetts, New York, and Minnesta) have not come up with solutions that can be followed with confidence by others; nevertheless there is general agreement that specialized programs must be provided for the individual whose intellectual subnormality is accompanied by persistent antisocial behavior, that these individuals the majority of whom are adolescents and young adults, must be provided for, not only for their own sakes but also for the sake of those less offensive with whom they are now mingled in residential institutions.

2. Case studies of adoptive mentally retarded children—why they were adopted, under what auspices, by what kinds of people and what were the

outcomes.

3. Assurances that the retarded child without parents will have the benefits of personal guardianship; provisions for competent public guardianship where suitable private guardianship is not available.

4. Projections of future need for residential care of the severely retarded based on analysis of changing trends in the characteristics of children for

whom such care is sought.

5. State planning based on such projections, and on a more penetrating study of the physical and social need of the grossly handicapped, needs which, despite felicitous phrases to the contrary, differ substantially from those of ordinary human beings who can speak and act for themselves.

H. Work and quidance

Accomplishments in work and guidance.—1. World War II produced one positive result for the retarded among so many negative; it gave them a chance to show their capabilities in industry and in the Armed Forces. (It is said that the successful retarded soldier was the one who had insight into his own

limitations, an important observation for those who guide them.)

2. Vocational rehabilitation of the mentally retarded as a major cooperative effort of official and voluntary agencies, local, State and National, became possible with the amendment in 1947 of the existing Federal Vocational Rehabilitation Act. While there are still some States which do not make enthusiastic use of the Federal assistance provided, the increase in the number of individuals being habilitated nationwide has been spectacular. (We do not have exact data on the number who are under 21.) This has been accomplished in the main by two types of service:

(1) Vocational counseling, with special reference to those leaving school;
 and
 (2) The establishment of occupational training centers and sheltered

workshops oriented to the needs of the mentally retarded.

3. While it is certain that a careful search of some of the multipurpose sheltered workshops of 1950 would have revealed a few high grade mentally retarded clients, those who in the early 1950's sought to lift the mentally retarded of marginal ability across the borderline from dependence to independence (or at least partial self-support) found no prototypes for what we have today. There were lessons to be learned from the workshops already

established for the blind and physically handicapped, but in most cases the personnel who had been successful with these partial disabilities found it hard to adjust to the less tangible, more pervasive and more time-consuming intel-

lectual and social handicaps of the mentally retarded.

Today, however, NARC is in touch with at least 100 sheltered workshops and training centers for the mentally retarded which offer real resources for youth from 16 to 21, as well as for young adults. Most of these workshops receive direct or indirect assistance from State and National vocational rehabilitation agencies; 17 of them are currently conducting research or demonstration projects on Federal grants. Somewhat more than half of the known workshops and training centers which serve the mentally retarded are operated by member units of NARC, the rest by a variety of community voluntary agencies. It has been repeatedly observed in these centers that IQ is much less highly corollated with placibility in competitive employment, or productivity in the sheltered environment, than with school achievement.

Tasks ahead in work and guidance.—I. Extension of the concept of "feasi-bility" to permit the rehabilitation techniques developed in rehabilitation centers-and workshops to reach those who would benefit by virtue of becoming less-personally dependent and less of an economic burden, even though not actually capable of earning. (An individual who can feed himself is less of an economic liability than one who is not, quite aside from humane considerations.)

2. Collaboration between schools, rehabilitation agencies and social agencies in establishing realistic goals toward which the retarded youth may be system-

atically directed.

3. The provision of living arrangements for the retardate who can hold a job but may not be strong enough to live quite alone.

I. Law and government

Accomplishments in law and government.—Developments in this field in the past decade fall in three areas: concern with the legal status of the retarded individual before the law; examination of the structure of State services, including questions of coordination; interstate cooperation; and the development of a Federal program by major agencies of the Department of Health, Education, and Welfare, with generous support from Congress.

1. In the areas of status of the individual we note: (a) recognition (with relatively little achievement to date) of the desirability of making voluntary admission rather than court commitment the procedure of choice when care of the mentally retarded minor is sought in a State institution; (b) constructive discussion and thought concerning the rights and responsibilities of the mentally retarded who may have been engaged in or accused of criminal

acts.

2. The structure of government and the need for interdepartmental coordination at the State level has been a principal or ancillary concern of at least 17 special State legislative or gubernatorial commissions appointed to review one or more major aspects of the State program for the mentally retarded. A schematic analysis was made by NARC in 1959 of the activities of those commissions which were active between 1956 and 1959.

3. Interstate cooperation was exemplified by a unique 2-day conference on State government responsibilities to the mentally retarded conducted by the

Council of State Governments in November 1958.

The Interstate Compact on Mental Health developed in 1955 and now adopted by some 15 State facilitates interstate transfer of mentally retarded individuals who have been admitted to a State institution, but whose welfare would be better served in another State for some reason, such as change of family residence.

4. The establishment in the Department of Health, Education, and Welfare in 1956 of an interagency coordinating committee with Dr. Joseph Douglas as chairman, signified a major intensification of effort of the Federal Government toward stimulating and assisting State and local governments and private organizations better to serve the mentally retarded. Since the HEW is itself the best authority on its activities, it would be presumptive of NARC to elaborate on this program except to remark that its impact has been felt in every corner of the country. A significant document relating to this development is "New Directions for Mentally Retarded Children—a Report of a Conference Convened by the Josiah Macey Junior Foundation at the Request of the Interdepartmental Committee on Children and Youth and held at Princeton, N.J., February 26–29, 1956."

Tasks ahead for law and government.—1. Further basic analysis of the application and applicability to the retarded of present laws relating to "mental incompetence," guardianship of the person and property of children and adults, criminal responsibility, and commitment or detention of the retarded, from the point of view of both the principle of parens patriae and the principle of individual liberty and "freedom and dignity" for all children.

2. Perfection of uniform methods which can be adopted in all public agencies for recording and analyzing statistical data relating to retardation, par-

ticularly in the field of public health, welfare, and education.

3. Development of a better rationale for sharing the costs of services to the retarded as between the individual or family and society on the one hand, and as between the various levels of government on the other.

4. Research on and application of better methods of making every public

dollar appropriated yield the most in service for the retarded.

VI. THE NARC PROGRAM 1950-60-PART B: PREVENTION

Perhaps it was an oversight on the part of the national committee to omit research among the list of environmental influences. Certainly in relation to mental retardation, it is a vital influence today in changing the world for children. Concerned as it is that the retarded children of today will be helped. NARC has nevertheless devoted major attention to reviewing the causes (bjological, psychological, and social) of mental retardation, and counts as a major achievement of the decade the publication of the volume "Mental Subnormality" by Drs. Masland, Sarason, and Gladwin. A book reporting on a 3-year survey sponsored by NARC, it reviews the dozens of known and suspected causes of mental retardation and outlines the directions in which research should now be pursued to uncover additional causes and to effect prevention of mental retardation at its many points of origin. The pursuit of the biological causes will take scientists into almost every branch of basic medicine. From the study of psychosocial factors there emerges a clearer concept of the role of cultural, emotional, and educational deprivation, which if sustained, can permanently aggravate or even cause an irreversible depression of mental development with mental retardation at the end product. The significance of the Sarason-Gladwin section of the reports has been since underlined by the subsequent publication of the results of a 6-year study of preschoolchildren, done under the direction of Dr. Samuel A. Kirk. Kirk showed that children who are mentally retarded and who suffer the additional handicap of environmental impoverishment have a better chance for sustained school achievement if provided with a well directed preschool educational experience.

Among the landmarks in research of this decade one must also rank high the establishment and rapid growth of the National Institute of Neurological Diseases and Blindness concerned as it is with most of the basic biological causes

of mental retardation.

Tasks ahead in prevention.—1. Vigorous support of research in the following principal areas in which research is important with respect to mental retardation.

Area A: Research in etiology, prevention, and treatment;

Area B: Research in accurate evaluation of the handicapped individual

in mental, physical, emotional, and social spheres:

Area C: Research in the development of effective training techniques, such as would permit the individual to develop his fullest potentialities, and Area D: Research to determine the best framework within which his teaching, training, living, and working can be most effectively carried on.

2. Additional efforts to assure that each new discovery will be applied at the earliest possible moment to the prevention of lifetime disability. During the past decade we have learned how to prevent mental retardation due to hydrocephalis, due to phenylketonuria, galactosemia and certain other specific disorders, but there are still children being lost to these diseases through lack of early detection or quick availability of prevention measures. Prevention of mental retardation due to psychosocial factors will be still more difficult, but a beginning could be made by more assiduous screening of children referred for early institutionalization.

VII. THE BASIC INGREDIENT: PERSONNEL

The well-rounded program clearly requires a large number of people with a great variety of professional and semiprofessional skills. Some of these needs are well documented (see USOE study on "Competences of Teachers" and NARO study of "The Need for Professional Personnel in Fields Related to the Education of Mentally Retarded Children"), of others we have the merest guesstimate. For example, the Joint Information Service of the American Psychiatric Association and the National Association on Mental Health reported in "The Staffing of Institutions for Mental Defectives" that there was great variability reflecting little scientific study in the estimates of institutional administrators as to their needs for the various kinds of professional personnel. All reflected a

universal sense of inadequacy, however.

Strides are being made in personnel training. However, in 1954 there were only four colleges and universities providing training programs for the new profession of rehabilitation counselor; by 1958 there were 30 such universities enrolling some 500 graduate students in this important field. The American Association on Mental Deficiency and the Council on Social Work Education are jointly working out recommendations for curriculum materials in this field for social students. During this decade for the first time a clinical pastoral training program for chaplains was inaugurated in a State institution for the mentally retarded. A unique program for the preparation of doctoral candidates in psychology with major focus in the field of mental retardation was established, at the George Peabody College for Teachers with a grant from National Institute of Mental Health.

Fortunately both lay and professional people with new ideas and new skills are joining the ranks daily. They are thinking, talking, reading, and writing, (Between 1950 and 1959 the American Journal of Mental Deficiency doubled the number of pages published annually and the new newspaper Children Limited attained a circulation of 45,000.) The retarded, like others, need a place to live, a place to learn, a place to work, a place to play, a place to worship, but most of all they need people. Between 1950 and 1960 more people than ever before learned about, thought about, and did something about the mentally

Testimony of Dr. Gunnar Dybwad, Executive Director, National Association for Retarded Children, Inc.

retarded. To sustain this rate of progress is the task of the next decade.

Mr. Chairman, I greatly appreciate the opportunity to appear before a committee that has done so much to bring about vastly improved opportunities for the mentally retarded in this country. We are deeply indebted to you not only for the legislation which you and your parent committee, under the chairmanship of the Honorable Graham Barden; have so successfully piloted through Congress but also for the helpful effect your warm and sustained interest in the mentally retarded has had on Government agencies, professional workers, and the general public.

I shall desist from reiterating here today facts and figures documenting the magnitude of the problem of mental retardation. You are only too well aware of this. Rather, I want to address myself briefly to some urgent problems in the field of education and rehabilitation which are in the particular purview of your committee. However, I hope you will permit me first to make some preliminary remarks on the urgent need for the development of better, specialized diagnostic facilities.

Unless we have available throughout the country clinics where an adequate early diagnosis can be made of the extent of retardation, and proper recommendations can be made for the management and training of the child, much ground will be lost for the eventual services to be rendered to such child by the public schools, residential facilities, and the rehabilitation agencies.

The mental retardation clinics, established through special appropriations made to the U.S. Children's Bureau, have rendered yeoman service, but all too few communities are blessed with such facilities, and even where there are clinics, long waiting lists exist. Furthermore, even the existence of sufficient diagnostic clinics is not enough, unless we have a means of case finding, some service that will be in a position to locate the parents of retarded infants and direct them to the clinic. Here again the U.S. Children's Bureau has begun to stimulate helpful community action by enlisting the aid of the public health nurse, so often the first of the helping services to reach our families. May we bespeak your interest in this most essential part of a comprehensive mental retardation program.

The need for early diagnosis has been reemphasized most strongly by a recently published study on the value of preschool education and training of the

severely mentally retarded child. I refer to Dr. Samuel Kirk's book, "Early Education of the Mentally Retarded," based on a study made under a grant of the National Instute for Mental Health. Dr. Kirk clearly demonstrates that children who had properly directed preschool training, based on an adequate diagnosis, were in a substantially better position to avail themselves of the programs offered by the public schools or appropriately privately sponsored classes. There is a continuing line from early diagnosis to child health and preschool services, to educational and recreational programs, and other needed community services on to vocational training, sheltered workshops, and job placement. Of course, a large number of the retarded will not reach this ultimate, optimum goal of employment, and, therefore, it is so important to have available, from the outset, good clinical and evaluation facilities to provide for each retarded person the type of program which he is capable of achieving.

May I now address myself to some of our immediate concerns, in the area of special education, as related to your committee's study. First of all, I wish to underline the grave concern of the National Association for Retarded Children, regarding the limited services available from the Section on Services to Exceptional Children and Youth in the U.S. Office of Education. In spite of the devoted and inspired service the staff has given, this Section is ill equipped both in the number of personnel available and in its low position within the echelon of the U.S. Office of Education, to serve the 12½ percent of our school population who, by reason of blindness, deafness, speech defects, mental retardation, emotional and social problems, and other childhood disabilities require specialized education services. Surely, these 5 million schoolchildren are entitled to more adequate attention from their Government. May I emphasize that we are as interested in services to the deaf, blind, or crippled child as in those for the retarded child. What helps all exceptional children helps the mentally retarded, and a lag in service to one of these groups inevitably will affect the others.

Reference to this broad concern of ours brings me specifically to Public Law 85–926, which has become, through the leadership of your committee, such a landmark in the field of special education. We respectfully submit that an extension of this legislation to other areas of exceptionality may well receive priority in the deliberations of your committee. Obviously, the increase, both qualitatively and quantitatively, in advanced postgraduate training in special education will benefit and further strengthen the programs now being set up in colleges and universities specifically for the mentally retarded.

In view of the fact that the significant developments in mental retardation are of most recent origin, it is of crucial import that the Office of Education have available consultant staff to help the various States with planning of these new services to make sure that newly gained knowledge in one State is made available in practical form to the other States and last but not least to provide proper implementation of those public laws which assign to the U.S. Office of Education special program and the program for advanced training in special education.

Strengthening the staff resources of the Section of Services for Exceptional Children and Youth in the U.S. Office of Education is badly needed also on another basis: The more we are thinking of a total program for the mentally retarded the more we must be concerned with close coordination between the education services of primary concern to the U.S. Office of Education and the rehabilitation services of primary concern to the U.S. Office of Vocational Rehabilitation.

Already the public school systems of a few cities have initiated in a number of ways on the secondary level vocational training programs for the mentally retarded. It is of the essence that these programs properly dovetail with the newest developments in the field of vocational rehabilitation. Achievement of this objective, too, will depend on the adequacy of staff resources in the Section for Exceptional Children and Youth.

REHABILITATION

In the area of rehabilitation, I wish to limit my remarks to a consideration of the so-called independent living provisions (title II) in H.R. 3465 introduced by the chairman of this subcommittee, the Honorable Carl Elliott. Suffice it to say that the National Association for Retarded Children strongly supports the other provisions in the bill relating to sheltered workshops, rehabilitation facilities, and competent evaluation services and we are confident that in the future

in all the States every effort will be made to extend these services to all mentally retarded capable of availing themselves of them. However, we are so particularly appreciative of the bill as introduced by Mr. Elliott because it incorporates in a tangible, forward looking way, the knowledge that has only recently been developed: that even with the most severely retarded (and, I hasten to add, the same holds true for other severely handicapped) we can expect definite improvement in their ability of self-care (however limited) if proper, qualified helping service can be provided.

Mr. Chairman, it has been brought out repeatedly in the course of studies in the field of mental retardation, that one of the most serious problems it produces is a drain on the family, necessitated by the extraordinary effort in caring for a severly retarded person. If the provisions of the independent living legislation eventually will make it possible to provide to such families a service so as to make a so-called permanent bed patient ambulant, to help a person to learn how to take care of his bodily needs, to enable a person to lessen his total dependence to the point of making some contribution to family life, the effect can be measured and should be appreciated as definitely as that in the case of a less severely handicapped person who has learned to earn a modest living.

Every day we are learning how seriously we have underestimated the potential in our severely retarded. We are finding increasingly that failure on the part of some retardates has been due to our having placed them too quickly into situations for which they were not yet ready. It is our firm conviction that the independent living facilities foreseen in your legislation will very sub-

stantially help the following three groups:

1. Those who are preparing for sheltered workshop and/or vocational rehabilitation services.

2. Those currently homebound but potentially able to participate as active members in the community to some degree.

3. Those currently in institutions who, through such services, as indicated may be returned to their homes.

It has been shown that for every 30 admissions to an institution for the mentally retarded, the State has to be prepared to spend \$1 million during the course of their care. If the independent living facilities and services will make it possible for persons to remain in their own homes who otherwise would have to be institutionalized, a very substantial saving would result. But even for those who now remain in the community, or for those now in institutions, the availability of independent living facilities and services would be of tremendous and lasting advantage.

We, therefore, strongly support, not only H.R. 3465 but in particular want to support title II of this legislation providing for independent living services.

Just as more than 16 years ago in 1943, Public Law 113, popularly known as the Barden-LaFollette amendments, set a landmark for the mentally retarded, so we now want to salute Mr. Barden and Mr. Elliott for their vision in recognizing the potential value of independent living services to the most severely handicapped.

TESTIMONY ON S. 1365, WHICH WOULD PROVIDE FOR THE EXPANSION OF DONABLE PROPERTY AUTHORIZED UNDER THE FEDERAL PROPERTY ADMINISTRATIVE SERVICES ACT OF 1949, SUBMITTED BY THE NATIONAL ASSOCIATION FOR RETARDED CHILDREN, INC., SUBMITTED TO SENATOR ERNEST GRUENING

I wish to thank the chairman and committee on behalf of the National Association for Retarded Children, Inc., for this opportunity to present testimony in behalf of S. 1365.

It has been only due to the imaginative leadership in both Houses of Congress that we have been able to make such outstanding progress in the field of mental retardation.

Tens of thousands of parents throughout the country are grateful. We come to you today confident we can entrust our case to your sound judgment and deep understanding of the problems of mental retardation.

In presenting this testimony it appears best to give you some brief background information on who we are, the group we represent, and then we will describe those of our national activities as manifested by our local units throughout the country which appear to us to fall within the framework of the law (Federal Property Administrative Services Act of 1949) and should be determined to be eligible to qualify to receive surplus property for either health or educational use.

WHO IS NARC?

The National Association for Retarded Children, Inc., known as NARC, is the only national voluntary, parent-inspired association whose primary purpose is to improve the welfare of retarded persons throughout the country. Our member units provide family counseling, special education and training, vocational training, integration to society, and assist in the training of personnel for the purpose.

There are close to 700 affiliated State and local units within the National Association for Retarded Children, Inc. Included in this figure are units in Hawaii, Puerto Rico, and in military installations abroad. The Parents Association for Retarded Children of Alaska, located in Anchorage, has been operating a program for some years and we will imagine one day will be affiliated with the National Association for Retarded Children. Generally, NARC broadens public awareness of problems of mental retardation. Specifically, it provides local units with consultation and guidance to improve their services and gain sufficient support.

There is substantial agreement that about 3 percent of the population, or 5 million children and adults, are mentally retarded to the point of requiring specific services or facilities either throughout their lifetimes or at crucial periods. These services or facilities may involve no more than the provision of special classes in the school system for the upper group of retardates, or perma-

nent nursing or infirmary care for the most severe cases.

In recent years it has been found practicable to divide the total number of retardates into the dependent, the semidependent, and the marginally independ-

ent groups.

One person out of every thousand of the total population, or one-tenth of 1 percent, belong in the dependent group, requiring hour-by-hour supervision. As adults they do not go beyond a mental age of 3 years (and many do not go that far). Many of them have severe physical handicaps, are unable to walk or talk; must be fed and clothed. Yet, even in this group some individuals have responded to training along minimum social lines, and these efforts, when successful, decrease the need for personal care and enrich the individual's human existence to the point that he can learn to walk, take care of his bodily needs, and dress and feed himelf.

Four persons out of every thousand population fall into the middle group of semidependents. Even the upper brackets of this group develop at less than half the rate of normal children, yet many have capabilities for learning selfcare, patterns of acceptable social behavior, and performance of useful work. Where these trainable children are given an opportunity to enroll in well-con-

ducted, well-staffed classes, important advances have been achieved.

About 2½ percent of the population, or 25 out of each thousand people, are found in the marginal independent group. As children they are considered educable, but sufficiently retarded to require attendance at special classes. Most of them can utilize some vocational guidance and training, and many eventually become at least partially self-supporting adults, capable of managing their own affairs, but they will need counseling in periods of stress and crisis.

NARC IN RELATION TO THE ACT

Mental retardation is no respecter of persons. We believe that every child has the right to be understood, respected, and helped regardless of his age, degree of retardation, station of life, economic condition, race or creed. We know that help for the retarded must be provided in a variety of ways. We, therefore, recommend to all of our member units that they provide a comprehensive program for all retarded children.

Some of these services are provided within the framework of agencies, such as the public schools, which serve other children. For others, special facilities may need be created by private resources. All member units affiliated with the NARC have one or several of the following services or functions they provide on a local level.

Diagnostic treatment clinics.

- Home visiting.
 Nursery classes.
- 4. Special education.
- 5. Vocational rehabilitation and sheltered workshops.
- 6. Community job placement.
- 7. Protection and guardianship.

8. Community centers.

9. Residence centers.

10. Research.

As we stated earlier for the record, "Many of our local member units find themselves struggling to maintain themselves and few have any sure fiscal or tax base under which they operate." This means that some of our member units provide one form of service or another depending upon their local needs, re-

sources, financial situation, and community support.

We feel that the following information is in keeping with the intent of the act as described under Section 13.2—Basic Policy: "It is the policy of the Department to strengthen and encourage the development and expansion of educational and public health programs and to promote a State of civil defense operational readiness by the equable allocation among the States of donable property for educational, public health, and civil defense purposes, and the assuring thereafter of its maximum utilization for these purposes."

We submit that the information we are presenting in this testimony needs to be properly interpreted so that eligibility to acquire both real and/or Federal surplus property for either health or education by our member units is in keep-

ing with the intent of this act.

We submit that many of our nursery classes, special educational classes, vocational rehabilitation and sheltered workshop programs, community centers, residence centers, and research programs are under the terms of this act potentially

eligible to acquire this property.

We have carefully reviewed the Federal Property and Administrative Services Act of 1949 and can honestly say that we are confused by the lack of clarity in both the interpretation and administration of this act as it affects some of these 10 areas of services or functions. What we mean is that in some instances sheltered workshops for example have been approved and declared eligible to receive Federal surplus property whereas in another instance this has been denied. The same holds true for our nursery classes, specail education classes, vocational rehabilitation functions, institutions, and research projects.

We will indicate several representative instances where this has occurred and

earnestly solicit your assistance in clarifying for us the discrepancies.

EXAMPLE A-WORKSHOPS

An example is a situation in San Francisco, Calif., where we have a vocational rehabilitation center which has twice been "approved" as its instructional standards met those required in the State for such service (vocational rehabilitation) yet has consistently been denied surplus property even though the approving agency is in the Department of Education, of the State of California, in this case the Vocational Rehabilitation Service, which is also cooperating with the Department of Health, Education, and Welfare.

On the one hand this vocational rehabilitation agency which is serving the mentally retarded adult in San Francisco is approved for a Federal grant from the Office of Vocational Rehabilitation under the Department of Health, Education, and Welfare but is denied surplus property by another division within that

same Department of Health, Education, and Welfare.

This vocational rehabilitation center provides a preliminary diagnostic workup and receives on those retardates admitted to the program, a medical report, social case study, educational report, and psychological report. It provides both individual and group therapeutic vocational counseling. This program offers vocational training, job placement, and community followup.

This vocational rehabilitation center in San Francisco, Calif., has as its director a Ph. D. and other qualified professional staff members. The other staff

members' degrees run from a B.S. to a medical doctor.

They have in addition on their advisory committee some of the top people in the State of California representing medicine, labor, education, and rehabilitation. They meet all of the criteria established under the law as such law refers to eligibility, yet they have been consistently denied the acquisition of Federal surplus property.

Finally this vocational rehabilitation center which is currently receiving a Federal grant which has research as one of its functions and which has been awarded to: "(1) Accelerate vocational rehabilitation services to severely disabled persons; (2) provide for prompt and widespread application of knowledge and experience acquired in the Office of Vocational Rehabilitation research grant program; and (3) test, insofar as possible, the application of the research

findings under varying circumstances in different parts of the country," still is

denied Federal surplus property.

In summing up we would like to refer to Title 45—Public Welfare, Subtitle A—Department of Health, Education, and Welfare General Administration, Part 13—Allocation and Utilization of Surplus Personal Property for Educational Public Health and Civil Defense Purposes Amendment. Under "Section 13.1 Definitions (c)" "Approved" means recognition and approval by the State department of education, State department of health or other appropriate authority with respect to an educational institution, such approval must relate to academic or instructional standards." Does not this vocational rehabilitation center meet the criteria for "approved" under this act?

We submit that example A just given meets the criteria under "Section 13.1 Definitions (n)" "Educational Institutions" means an approved or accredited tax-supported or nonprofit school system, school, college or university." We refer here to the words "approved" and "school," because the candidates for this vocational rehabilitation center all are vocationally evaluated and given their rehabilitation training as a preparation for remunerative employment.

We submit that under the same section (o) "Eligible Applicant" means a civil defense organization as defined in section 13.1(e) or an approved or accredited tax-supported medical institution, hospital, clinic, health center, school, school system, college, university or nonprofit medical institution, hospital, clinic, health center, school, college or university." This example A as cited would meet the criteria and intent of the law particularly as either a health center, school, clinic, or nonprofit clinic.

For the same reasons we submit that example A meets "Section 13.1 Definitions (p)" "Health Center" means an approved facility utilized by a health unit for the provision of public health services, including related facilities such as

laboratories and clinics."

We submit that example A meets the criteria under "Section 13.1 Definitions (x)" "School" means an approved or accredited organization entity devoted primarily to approved academic, vocational, or professional study and instruction which operates primarily for educational purposes on a full-time basis for a minimum school year and employs a full-time staff of qualified instructors."

We submit that the additional material cited below has significant meaning to our testimony as it relates to example A and similar structured agencies

being considered eligible to receive said property.

"Title 45, Public Welfare Subtitle A, Department of Health, Education, and Welfare General Administration Part 12—Disposal and Utilization of Surplus Real Property for Educational Purposes and Public Health Purposes:

"Section 12.3 General policies (a) It is the policy of the Department to foster and assure maximum utilization of surplus real property for educa-

tional and public health purposes, including research.

"(f) Only those activities devoted to academic, vocational, or professional instruction, or organized and operated to promote and protect the public health, are eligible. Examples of such eligible activities are universities, colleges, junior colleges, junior or senior high schools, elementary schools or school systems, vocational or specialized schools, research activities, public libraries, and similar activities primarily educational in character; general and specialty hospitals, mental institutions, clinics, health sanitation activities (including water and sewer departments), facilities providing public health services, and similar activities devoted primarily to the protection and promotion of public health. The program of an institution eligible for a transfer must contemplate use of the property as an integral part of an approved or accredited activity of the kind above described. The activity must obtain such licenses for operations as may be required by State and local law.

"(g) Use of the property applied for must be for a fundamental educational or public health purpose. Examples of such fundamental utilizations are classrooms, vocational shops, libraries, laboratories, auditoriums, gymnasiums, cafeterias, dormitories, faculty housing, infirmaries, recreational facilities, hospitals, clinics, facilities providing public health services, and similar utilization. The property applied for must be for a purpose for which the eligible organization

would be authorized to expand its own funds to acquire."

We have taken this time to describe example A, the case of a vocational rehabilitation center, being denied eligible to receive real and/or Federal surplus property because there are currently in operation some 17 such projects across

the country. Four of these projects, to our current knowledge and information, have been declared eligible and are receiving said property. These four are in the States of Delaware, Louisiana, Maryland, and Texas. The balance of the selected research demonstration projects are serving the mentally retarded in the States of Missouri, Washington, Colorado, Rhode Island, Georgia, Illinois, Pennsylvania, Alabama, Tennessee, Ohio, and Virginia. These centers are not to our knowledge receiving said property.

Though we do not have all the information available, but it can be made available, we know that the majority have similar agency structures and have professional qualified staff, advisory committees, and have been approved under their various State vocational rehabilitation agencies as operating recognized

rehabilitation training programs.

This is a clear lack of inconsistency, for on the one hand an agency is determined to be eligible to receive said property and on the other hand denied. There is, in our opinion, no substantial difference between the agencies concerned. It points out to us a need for clarification. Needless to say, the tremendous amount of good said acquisition of property could do to further rehabilitate our adult retardates is obvious. In addition, the financial savings to the local, State, and Federal governments would be considerable.

EXAMPLE B-OTHER WORKSHOPS

In January 1959, the National Association for Retarded Children reported on the first nationwide study dealing with sheltered workshops. A summary report prepared by the National Association for Retarded Children discloses that there are 56 sheltered workshops being operated by our member units.

We know that a substantial number of these workshops offer vocational evaluation, personal adjustment training, vocational training, job placement, and followup. A large number of these have been approved by their local and State vocational rehabilitation agencies and are currently receiving training fees for

services rendered.

Several of these workshops have previously qualified for and received Federal moneys under Public Law 565, the Vocational Rehabilitation Amendments of 1954. The majority of these workshops have qualified professional staff members operating the program. Several of these workshops have maintained direct referral channels with departments of special education.

It would appear that example B also falls under the category "eligible" to

receive said property as either a health or education program.

Those sheltered workshops which do not provide vocational evaluation, personal adjustment training, vocational training, may nonetheless provide supportive counseling, sheltered employment and job placement, and followup. Those aspects of the program other than the sheltered employment it would appear would meet the criteria enabling them to be declared eligible under either health or education.

EXAMPLE C-SURPLUS PROPERTY BROCHURE

The National Association for Retarded Children, Vocational Rehabilitation and Sheltered Workshop Committee during the months of May and June 1958, was in direct contact with the then Acting Chief, Surplus Property Utilization Division, Department of Health, Education, and Welfare and consulted them for advice on the pamphlet titled "How to Acquire Federal Surplus Real and Personal Property" ("Acquiring Surplus Property for Health or Educational Use"), and was told the following: "The material is excellent and contains nothing which is contrary to Federal law or procedure."

The above quote refers to a two-page notice titled "Bi-Monthly Report of Sheltered Workshops and Vocational Rehabilitation Committee, No. 2, August 1958, 'How to Acquire Federal Surplus Real and Personal Property,'" which was sent to all of our member units across the country, our workshop directors and planners, Office of Vocational Rehabilitation, regional representatives, and State

vocational rehabilitation directors.

Acting on the information we had from the Acting Chief, Surplus Property Utilization Division, we lead our member units to believe that those member units who operated vocational rehabilitation training facilities might expect to qualify to receive said property if they applied and were declared eligible. It would appear to us that example C further indicates the need for clarification of this act.

EXAMPLE D-STATE INSTITUTIONS

There are in this country more than 100 State institutions for the mentally retarded. Every one of them performs in addition to nursing care for the "crib cases" such services that fall under the headings "Education" and "Health"

Several of our institutions are currently engaged in vocational rehabilitation activities particularly as a means toward releasing those able to function as a contributing member in the community. Institutions in the States of Indiana and Kansas both are operating vocational rehabilitation research projects, in part supported by the Office of Vocational Rehabilitation, Department of Health, Education, and Welfare.

This past year, 10 of our State institutions were visited and their vocational rehabilitation programs discussed with the superintendents and the vocational rehabilitation staff. It is our opinion that every one of these 10 institutions would be most happy to receive said property. Do they not qualify as eligible?

EXAMPLE E-CLINICS

Many of our member units operate clinics for mentally retarded children in cooperation with other local, State, and Federal agencies. Some of these clinics operate under special projects received through maternal and child health funds of the Children's Bureau, Department of Health, Education, and Welfare. Time did not permit us to query all of these clinics but we believe that they would qualify for eligibility to receive said property. Certainly these facilities fall under the category Health.

EXAMPLE F-SCHOOLS

Although we have information to present in behalf of our programs which fall under the act as school, it is our understanding that testimony will be given by a representative from the Department of Education, that is, the U.S. Office of Education, Department of Health, Education, and Welfare.

Table I.—Replies to inquiry "Did you ever receive Federal surplus property?"

State	Member units reply received	Yes	No	Inter- ested
Alabama Alaska Alaska Alaska California Connecticut Delaware District of Columbia Florida Georgia Illinois Indiana Illinois Indiana Illinois Maryland Massachusetts Michigan Minnesota Mississippi Missouri Nebraska New Jersey New York North Carolina Ohio Dibuttoria	1 1 1 1 5 5 5 3 3 4 4 4 4 4 9 9 8 8 4 4 4 9 6 5 5 5 5 5 5 5 8	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	1 1 3 3 3 3 1 1 1 1 1 1 2 2 1 1 1 1 1 3 3 3 3	1 1 1 1 2 5 5 3 3 4 4 1 1 1 1 2 2 8 8 8 8 4 4 1 1 1 2 2 2 8 8 3 2 2 8 8 3 3 2 3 3 1 1 4 5 5
Total	130	11	21	98

We believe that had we more time in which to gather our information we would have presented additional data to substantiate our testimony. We are sure, Senator Gruening, that you will be pleased to know that we received information from a representative of the State rehabilitation agency in Anchorage, Alaska, who in a personal telephone call to our National Association for Retarded Children said "We have sufficient retarded clients who we are currently unable to serve as well as we would like to due to the lack of suitable facilities which are practically nonexistent. If we could allocate staff to vocational rehabilitation functions for the adult retarded, we would welcome said surplus property."

Senator Gruening, in addition to this information from Alaska we have been receiving telegrams, special delivery letters, airmail letters, telephone calls, and the like from our member units all over the country in response to your directive "that we solicit their assistance in determining whether or not they have ever applied for or received Federal surplus real and/or personal property." We are quite concerned with these replies which will be entered into the record.

We have prepared a digest of the replies we received from our member units. Due to the short notice we received, vacation time of the year, and the lack of all of the messages being delivered promptly, we were unable to receive more replies than we indicate. You will note that our member units in the West and Far West are not included in this report. We did not notify these States because we felt we would not be able to receive replies back in time to meet the deadline date set for this hearing. A reply from California is included because of a recent trip to that State which revealed the information cited in example A.

In reviewing the replies received from our member units when we asked them whether or not they had ever received Federal surplus property, we were struck by several significant factors which appear best summarized below.

These replies came from 35 States and represent 130 member units,

1. The majority of those 98 member units who expressed interest in receiving said property stated that they would have applied had they known they were eligible; others expressed a dire need for surplus property to help equip and/or house their classrooms, workshops, day centers, and the like. Still others expressed interest for the future in anticipation of their sponsoring new programs. The receipt of such surplus property would, as we have said before, enable them to initiate programs and render direct services for our retarded children in this country.

2. Those 21 member units who denied the receipt of said property said they were denied eligibility because they did not meet the requirements of the law. (We have already indicated to you under examples A-F our feelings about.

this.)

3. Of the 11 member units who reported they received said property the donees operate workshops, camp programs, clinics, vocational training pro-

grams, special classes, recreational programs.

All of the information contained in this testimony has been presented to the committee in order to show instances where the services and programs provided by the member units of the National Association for Retarded Children properly belong under the current wording of the act, under the categories health and education.

We believe that this is in keeping with the intent of the law, the policy as referred to in this testimony and does not constitute testimony presented as a new agency applying for said property so much as agencies which should

properly be recognized as eligible under the current act.

We are deeply interested in those bills which would extend said property so that new services and programs not currently accepted as "eligible" would be included under this act. We are very anxious to have included at this time testimony in behalf of our recreational programs for both retarded children and adults and all other functions which would tend to result in character and individual development of our retarded children and adults.

We, of the National Association for Retarded Children, wish to express our thanks to you. Senator Gruening and your committee, for taking the initiative in holding hearings on those various bills which would provide for the expansion of surplus property. We cannot tell you what the receipt of said property means to every parent of a retarded child when such property enables them to feel there is "help" for them back home in their efforts to provide for their

children as we would for ours. We hope this testimony in part has conveyed that message.

Supporting Statement on the Rehabilitation Act of 1959 Submitted by the National Association for Retarded Children, Inc.

The National Association for Retarded Children is pleased to offer its support of the Rehabilitation Act of 1959 on behalf of 5 million retarded children and adults in this country. This testimony will present some background information on who we are, the group we represent, and will describe those of our activities germane to the topic. We will point out how this act would enable vital services which are currently unavailable to be provided for the adult retarded in this country.

WHO IS NARC?

The primary purpose of The National Association for Retarded Children, Inc., is to improve the welfare of retarded persons through counseling for the family; special education and training; vocational training; integration into society; and training personnel. Current research efforts are directed toward prevention.

The National Association for Retarded Children, Inc., known as NARC, is the only national voluntary, parent-inspired association devoted exclusively to

an aggressive, united attack on the problems of mental retardation.

There are 658 affiliated local and State units. Included in this figure are units in Hawaii, Puerto Rico, and in military installations abroad. Generally, NARC broadens public awareness of problems of mental retardation. Specifically, it provides local units with consultation and guidance to improve their services and gain sufficient support.

WHOM DO WE REPRESENT?

There is substantial agreement that about 3 percent of the population, or 5 million children and adults, are mentally retarded to the point of requiring, specific services or facilities either throughout their lifetimes or at crucial periods. These services or facilities may involve no more than the provision of special classes in the school system for the upper group of retardates, or permanent nursing or infirmary care for the most severe cases.

In recent years it has been found practicable to divide the total number of retardates into the dependent, the semidependent and the marginally independ-

ent groups.

One person out of every thousand of the total population, or one-tenth of 1 percent, belongs in the department group, requiring hour-by-hour supervision. As adults they do not go beyond a mental age of 3 years (and many do not go that far). Many of them have severe physical handicaps, are unable to walk or to talk; must be fed and clothed. Yet, even in this group some individuals have responded to training along minimum social lines, and these efforts, when successful, decrease the need for personal care and enrich the individual's human existence to the point that he can learn to walk, take care of his bodily needs and dress and feed himself.

Four persons out of every thousand population fall into the middle group of semidependents. Even the upper brackets of this group develop at less than half the rate of normal children, yet many have capabilities for learning self-care, patterns of acceptable social behavior, and performance of useful work. Where these "trainable" children are given an opportunity to enroll in well-conducted, well-staffed classes, important advances have been achieved.

About 2½ percent of the population, or 25 out of each thousand people, are found in the marginal independent group. As children they are considered educable, but sufficiently retarded to require attendance at special classes. Most of them can utilize some vocational guidance and training, and many eventually become at least partially self-supporting adults, capable of managing their own affairs, but they will need counseling in periods of stress and crisis.

In order to obtain a clear picture of the kind of assistance that has been offered to the mentally retarded person to help prepare him for his contribution to himself, his own family, and to society at large, we need to review briefly

two necessary areas in his life development-education and training.

EDUCATION

"The problem of mental retardation has probably existed since the beginning of man. In the United States the first institutions were organized in Massachusetts and New York about 1850. It was believed at that time that the organization of institutions was the solution to the problem. The second development, about 50 years later in 1896, was the establishment of special classes for the educable mentally retarded. Both of these developments have been extended to practically all of the 48 States. Both kinds of organizations—institutions and public school classes for the educable mentally retarded—are still expanding since they have been unable to meet the demands placed upon them.

"Fifty years later, around 1950, we find a third development, the organization of community classes for severely retarded or trainable children, primarily under public school auspices. This third development points up the fact that institutions and public school classes for educable children are not sufficient, and that other provisions are necessary. The efforts of parents to retain their retarded children at home and find community provisions for them has resulted in the organization of classes for trainable children in 18 States.

"But the organization of classes for trainable children in communities is not going to solve the problems of all parents who wish to retain their children at There will be many others for which provisions are not available. is responsible for the preschool severely retarded child in the home? provisions will be made for him? Since schools admit only school-age children, will the provisions be day-care centers or classes under a welfare agency? Who is responsible for the severely retarded adult at home? Is the sheltered workshop the answer? And who is responsible for the custodial child if the parents refuse to send him to an institution? Who is responsible for diagnosis and for parent counseling?"(1)

TRAINING

The history of the State-Federal program of vocational rehabilitation in this country dates back to 1920 when the National Civilian Vocational Rehabilitation Act was enacted.

This original act did not provide services for the mentally retarded. With the passage in 1943, of Public Law 113, which became popularly known as the Barden-LaFollette amendments, the mentally retarded were included for the first time among those to be provided with rehabilitation services.

"Prior to 1943, the major emphasis in vocational rehabilitation was on training and placement. Medical aspects of rehabilitation, the psychological impact of the disability, counseling, and interviewing, intensive use of community resources-all those accepted tools of vocational rehabilitation today, were not recognized as basic to vocational rehabilitation until the passage of the Barden-LaFollette Act" (2).

The following services are provided throughout the Nation:

- Thorough physical examination;
- (2) Necessary medical, surgical, psychiatric, and hospital services;
- (3) Necessary prosthetic devices, such as artificial limbs, hearing aids, trusses, and the like:
 - (4) Individual counseling and guidance:
- (5) Training for a job in schools, on the job, by correspondence or by tutor or related:
 - (6) Maintenance and transportation during rehabilitation, if necessary;
 - (7) Necessary tools, equipment, and licenses;(8) Placement on the right job;
- (9) Follow-up to make sure the worker and the job are properly matched. In 1954, "Executive hearings were conducted by the House Committee on Edu-

cation and Labor and open hearings by the Senate Committee on Labor and Public Welfare. The result was the passage of Public Law 565 of the 83d Congress, which was signed by President Eisenhower on August 3, 1954" (3).

NONPROFIT WORKSHOPS

Under Public Law 565, otherwise known as the Vocational Rehabilitation Amendments of 1954, the vocational rehabilitation program was greatly expanded through a three-part grant structure, making grants available for (1)

¹ This report was written prior to Alaska and Hawaii Statehood.

support of basic State vocational rehabilitation programs; (2) extension and improvement of rehabilitation services; and (3) support of special projects.

This legislation gave impetus to the growth and development of expanded and improved vocational rehabilitation services for the mentally retarded. Sheltered workshops emerged as a new resource in the total effort to rehabilitate the potentially employable mentally retarded.

The National Association for Retarded Children reported in 1959 on a nationwide survey it conducted on 56 member units of the NARC Operating Sheltered

Workshops for the Mentally Retarded in 1956-57 (4).

The majority of such programs serve those retardates "who have a reasonable employment potential" through the utilization of the workshop program of service. The three major services rendered by most sheltered workshops include: (1) Vocational evaluation; (2) adjustment and vocational training; (3) remunerative employment.

The last report from the Office of Vocational Rehabilitation (1958) states that 1,600 mental retardates were rehabilitated for gainful employment as contrasted

with 1.094 in the previous year.

It has been estimated some 250,000 adult mentally retarded can profit from a sheltered workshop experience" (5). The need for additional facilities of this type are obvious when one compares the number of retardates being rehabilitated annually as of today.

Title III of the Rehabilitation Act of 1959-"Workshop and Rehabilitation

Facilities" would provide for additional facilities of this type.

However, our nationwide workshop experiences reveal that the mentally retarded separate out into four groupings within such vocational rehabilitation training programs;

Group description

Group A: Those retardates able to be successfully placed into competitive employment at the end of their sheltered workshop training.

Group B: Those retardates able to maintain productive roles within the

sheltered workshops.

Group C: Those retardates unable to maintain consistent productivity within the sheltered workshop.

Group D: Those retardates unable to meet sheltered workshop standards.

Those retardates in Groups C and D require a different type program to meet their needs. Then there are, in addition, a number of severely retarded currently unable to gain admission into sheltered workshops.

INDEPENDENT LIVING CENTERS

In order to serve those retardates in Groups C and D as well as those unable to enter into sheltered workshop programs, additional adult programs are required. These retardates will require such programs in the areas of personal and social development which will enable them to become more self-sufficient and self-reliant.

Title II of the Rehabilitation Act of 1959—"Independent Rehabilitation Services"—would establish a program of rehabilitation, construed in this broader sense. It would enable adult retardates, able to do so, to leave an institution and to achieve such degree of independent living as to dispense with the need for institutional care. It would enable those adult retardates who are homebound to enter into independent living rehabilitation programs thereby largely

dispensing with the need for their being attended at home.

If we as a nation are to take advantage of the proposed "independent living" legislation, it becomes imperative that we begin to think now and plan ahead for new facilities and new services for our country's severely retarded adults. Special programs will be required for those unable to become remuneratively employed within the sheltered workshops. New programs will need to place a greater emphasis on an individual's ability to function and to participate within the home, the community, and within an adult activity which need not be vocational in nature. "There is a need to make a life rather than a living" (6).

"For more than 10 years the spotlight in rehabilitation has been on the person with a disability and the team immediately surrounding him. Now the focus should broaden to emphasize the everyday life of the disabled person, his home, community and the society in which he lives, if we are to insure for him a

satisfying and productive existence" (7).

As necessary as institutionalization may be for some retardates ("about 150,000 persons were in such public institutions at the end of 1957") (8), there is widespread agreement that those able to remain at home and in the com-

munity should be enabled to do so.

Saenger (9) in a comprehensive study of 2,640 severely retarded adults reported that two-thirds "were found to be living in the community.* * A major part of the study was concerned with the home adjustment of the severely retarded. Most had made a good adjustment; one in four participated in everyday family life, took an active interest in the affairs of other family members, and tried to help within the limitations of their ability. About one-half were able to communicate in a limited way with other family members."

Improved medical care, better dietary management, wholesome activities and work opportunities all seem to contribute to a substantial lengthening of the life span of the retarded. Hence it is of the utmost importance to plan now for the anticipated presence in communities of a substantially larger number of older retardates, through hostels and other residential facilities, vocational opportunities, recreational outlets and appropriate counseling resources.

"I propose that the retarded have the same right as anyone else to be at home and to remain in their communities. This concept implies that, whenever possible, we must minimize the differences between their mode of living and that of others. The greater the likelihood for the retarded to remain with his own family during his childhood, and in his own community as at least a partially contributing member during his adult life, the fuller his life will be. If we agree on this principle, then we must admit that his separation from his family or his community is likely to be a sign of failure, either on his part or on the part of those responsible for his care" (10).

Certainly there is no comparison to the cost involved in providing independent living rehabilitation services to the costs of institutionalization. When one reviews the cost of institutionalization "the average maintenance expenditure

per patient (in 1957) was \$1,279.67" (11).

Though there are no accurate figures on the costs of building new institutions, a few costs of recent buildings might be helpful to indicate what part of these costs are

No one of the above facilities serves more than 1,200 patients.

As Miss Mary Switzer, Director, Office of Vocational Rehabilitation has stated: "For every dollar spent on vocational rehabilitation we can expect a return to society of \$10 in taxes" (12).

Appropriations for the Rehabilitation Act of 1959 are recommended as \$10 million for the first year; \$12,500,000 for the second; and \$15 million for the

third.

Why should the National Association for Retarded Children, Inc., discuss institutionalization costs in presenting testimony on a rehabilitation bill? Unfortunately, the group of retardates who would benefit most from the Rehabilitation Act of 1959 (the semidependents, see p. 1 of this report) are, in most cases under current vocational rehabilitation practices (Public Law 565) unable to receive any services whatsoever. Past experience with our adult retarded population clearly shows what occurs when no services are made available in the community. As a result these retardates are either kept at home, left to look out of a window as the world goes by with television (if available) as their major source of enjoyment, (13) or else they are institutionalized.

One of the key provisions of the Rehabilitation Act of 1950 is "Title IV: Rehabilitation Evaluation Services." "The term 'rehabilitation evaluation services' means (1) diagnostic and related services (including transportation) incidental to the determination of the nature and extent of an individual's physical and mental impairment and rehabilitation potentials and the rehabilitation services required to realize these potentials, (2) the determination of appropriate referral of such individual for vocational rehabilitation services as defined in title I of this act, independent living services as defined in title I of this act, or other

needed services provided by public or private agencies (4).

Under the present laws, State rehabilitation agencies could conceivably provide this service to applicants for vocational rehabilitation, but have shown them-

selves reluctant to do so when the prognosis appears to be something less than vocational rehabilitation.

Many people believe that the weakest element in present vocational rehabilitation programs is that of evaluation. The National Association for Retarded Children feels that the need for effective evaluation services would be intensified, if the States accepted responsibility for the rehabilitation of persons who would not be required to have vocational potential at the time of application. If this title becomes effective, it is believed that it will accomplish more than any other one thing could do to systematize and bring order into rehabilitation activites, assuring that no one is denied at least an adequate evaluation. It would furthermore, centralize in one place, under one agency, evaluation services for all adults.

Vocational rehabilitation services should be greatly improved, particularly for the severely retarded. It should no longer be required that the agency decide in the beginning whether the handicapped individual can be vocationally rehabilitated. This will result in the acceptance for services of many retardates who otherwise would have been rejected, without being given an opportunity to

actually demonstrate their potentials.

It is logical to assume that there will be a number of retardates who will be able to progress from an institutional or home setting to a life in the community. These retardates may even make a partial contribution and some will make a full contribution to their families, themselves, and to society through either

sheltered employment or full-time employment.

Whether we call the mentally retarded, subnormal or deficient; whether their disability is mild, moderate, or severe; whether they are capable of being dependent, semidependent, or semindependent; extremely retarded, trainable, or educable, unless we provide for their needs, account for their individual differences, and recognize that they, like all of us, function on different levels at home and in our society at large; then we will further retard their development and deny them the opportunity to make a contribution, not only to their families, to the total social effort but to themselves as individuals. And it is this right, once provided, that will again affirm what is essential and unique in our American way of life.

In speaking about the physically handicapped in the publication, "The Handicapped and Their Rehabilitation" Hoerner says: "Through a functional activities treatment program, it has been demonstrated the the individual's physical and mental reserve potential (his safety factor) capabilities can be brought forth, and that eventual adjustment of total or partial physical and vocational independence can be achieved. Functional training directed toward four major objectives have been grouped under the term "activities of daily living":

(1) Maximum use of the hands in all self-care.

(2) Ability to travel about.

(3) Adequate speech.

(4) Normal, near normal, or good cosmetic appearance" (15).

This above quotation describes training objectives in rehabilitation which excludes the mentally retarded. Are the retarded without the need to learn how to use their hands effectively, productively? Do they not need to travel about? Are they not able to use speech? Should they not be as normal look-

ing as possible?

The counterpart program for the mentally retarded which would provide for activities of daily living is called personal adjustment training. A working definition of personal adjustment training might well be "personal adjustment training is the process of providing social, emotional, personal, spiritual, and physical experiences for the mentally retarded as a necessary step toward their

living independently in society.'

The program, physical demands of daily life as developed by the Institute for Crippled and Disabled in New York (16) could be adapted so that the needs of the mentally retarded were properly recognized. It could become an integral part of the personal adjustment training program with one major difference. Instead of providing instruction and training toward employment preparation, the initial emphasis would be instead on both home adjustment and community participation.

By providing for developmental experiences in the area of fundamental home skills (meal preparation, dishwashing, care of clothes, bedmaking, room care, local travel, and other self-care activities) a foundation is laid for family rela-

tionships, home responsibilities, and independent living.

Additional graded experiences and opportunities for everyday social activities, proper use of leisure time, avocational skill development, interpersonal

relationships, and personal need fulfillment pave the way for good health habits,

individual adjustment, and community participation.

In some instances, as a byproduct of these independent living rehabilitation activities those retardates able to progress and partake of sheltered workshop programs will be better prepared for such vocational training programs. Because of their participation and sharing in home responsibilities and community activities, they will be more wholesome well-rounded individuals. Their personality development will be reflected by the gains they make through successful personal, social, and interpersonal relationships.

In all instances, the severely retarded will be able to live a more fruitful, less dependent life thereby becoming less of a burden to themselves, their families. and society. Such an undertaking of this type is in keeping with our demo-

cratic way of life and is in the public interest.

The Rehabilitation Act of 1959 will enable a considerable number of the mentally retarded to become rehabilitated. Too often the end of education for our severely retardates has resulted in a return to their homes or institutionalization. Our hopes lie in this act which will provide so much help to those who need others so that they can help themselves.

Mr. Elliott. I have spoken to Dr. Foureacre a while ago about giving us a statement with respect to the use of the fellowship provisions of this Public Law 85-926 in his institution, but I believe he

Our next witness is Dr. George H. Schroeder, of the Bronx Society

for Prevention of Cruelty to Children.

STATEMENT OF GEORGE SCHROEDER, PRESIDENT, BRONX SOCIETY FOR PREVENTION OF CRUELTY TO CHILDREN

Mr. Schroeder. Mr. Chairman and members of the committee, I am president of the Bronx Society for the Prevention of Cruelty to Children, located at 609 East 163d Street, Bronx, N.Y. Ours is the only children's society serving a community of 1,500,000 persons.

I have been affiliated with the organization for years, the last 10

of which I have served as its president.

Our society was created as a consequence of an urgent appeal made by the New York Society for the Prevention of Cruelty to Children, which found that due to limitation of resources it was unable to properly serve the phenomenal increase in referrals brought about by an increase of population.

Hence the public-spirited men and women of the Bronx established

their own organization.

The articles of incorporation for the Bronx Society for the Prevention of Cruelty to Children states the particular object for which the corporation is to be formed is the prevention of cruelty to children.

The extension of these objectives would include neglect of children, abuse, exploitation, and cruel treatment; also abandonment, failure to provide, endangering the life and health of children, as well as supervision in the areas relative to the employment of minors in hazardous occupations; the attendance of children at prescribed resorts, such as poolrooms, dancehalls, and places where liquor is sold, as well as the city code of ordinances which requires that society process all applications for the applicable performances by children.

Mr. Elliott. Does your society recommend against parents spank-

ing their children, Mr. Schroeder?

Mr. Schroeder. Do they recommend against parents spanking their children?

Mr. Elliott. Yes.

Mr. Schroeder. We haven't taken a stand as to whether they should be spanked or not. I have personal feelings on that, but there are times when they are overspanked and times when they should be spanked.

I believe the rod should be used at certain times, but to a degree of

commonsense.

The increased costs of operation, as well as an exploding population growth, does not permit us to fully serve the child welfare needs of

our community, due to very limited resources.

Our situation is further aggravated by a marked change in population characteristics. The greatest population changes in the Bronx have occurred with respect to the growth of population in two ethnic groups.

Informed statements made by the city planning department indicate that the number of Puerto Ricans, for instance, of the first and second generation living in the Bronx, is in the vicinity of 140,000 to

150,000.

The growth of the Negro population in the Bronx, while it has been steady, occurred for the most part in the years between 1940 and 1950.

In 1920 only 4,803 lived in the Bronx. The number has grown

to 12,930 by 1930 and 25,529 by 1940.

During the 1940's, however, over 74,000 were added—an increase of 315 percent.

A substantial proportion of the New York City public assistance caseload is drawn from these underprivileged groups. This is not surprising when one considers that these groups are heavily concentrated in the more unskilled, low-paid occupations, suffering as they do from lack of education, the difficulties of adjustments to their new environment, and from a degree of discrimination.

We believe our major problems with the children and adults to be classified as problems of the socially handicapped and the emotionally disturbed. Therefore, we feel that they should be the concern of this committee on special education as one of the major problems of our community and other similar communities throughout the Nation.

We believe these problems in the great metropolitan community such as ours cannot be solved by the local community alone. We are ready and willing to bear our share of the burden, but the tremendous influx of people from all States of the Union to the New York area and the Bronx has placed the burden upon local agencies far beyond their power to carry alone.

We feel that some form of direct aid from the Federal Government to the public and private agencies of this State trying to meet this urgent need of our antiquated service program for these visually and emotionally handicapped children should be coming forth soon.

We stress direct aid because we believe we exist to give immediate

services to needy children and adults requiring treatment.

We do not depreciate the value of research, but we have a problem in supplying direct services, social work, psychiatric services, parent education, and immediate protection to the children of our community, which is of sufficient magnitude to cause us concern for our day-to-day problems.

With some outside supplementary aid, we believe we can service our

city in a practical and concrete way.

The form of this Federal aid must, of course, be left to your committee, but without some direct aid hundreds of children and families will continue to go unaided.

We believe our city and State can do more, and we as community leaders can make a determined effort to close the gap between needs

unmet and facilities to meet them.

But we cannot do it alone.

I appreciate very much this opportunity to speak before you. Thank you.

Mr. Elliott. Thank you very much, Mr. Schroeder. We are happy

to have heard you.

If you have any further evidence, or if you did not read all of your statement, we will be happy to have it within 10 days to include in the record.

Mr. Schroeder. Thank you.

Mr. Elliott. Now, as our hearings come to a close, may I, on behalf of the Subcommittee on Special Education, take this occasion to very sincerely thank Dr. Merle Frampton, who heads our special education and rehabilitation study.

Thank you very much, Dr. Frampton, on behalf of the committee. Now, may I thank the members of the subcommittee who have been

so kind as to work long hours these past 2 days.

At the same time, I would like to thank the employees of the subcommittee for the very fine and efficient service that they have rendered.

The subcommittee will probably meet around the middle of December for hearings in New England area.

The members of the subcommittee will be advised just the very minute that I can determine first whether or not the hearings can be had, and, if so, where and when.

At this point in the record I will place a copy of a statement from the New York Service for Orthopedically Handicapped, dated

October 29, 1959.

(The statement referred to follows:)

STATEMENT OF DR. MELVIN HERMAN, EXECUTIVE DIRECTOR, NEW YORK SERVICE FOR ORTHOPEDICALLY HANDICAPPED

Mr. Chairman and members of the committee, I am Melvin Herman, executive director of the New York Service for Orthopedically Handicapped, a voluntary agency which has long been concerned with services to the disabled. In the 54 years of our agency's existence, we have offered a variety of services to handicapped children and adults, including special schooling, shelter employment, summer camping, and year-round recreation. We have just begun a modest new program of independent living which will attempt to provide foster homes or apartments for handicapped young adults who are currently living in hospitals or in the community under unsatisfactory circumstances.

In the course of offering our other services we have seen numerous situations in which handicapped persons, having achieved maximum medical rehabilitation, continue to live in hospitals or other institutions because no other suitable alternatives exist. We are deeply convinced that a new approach is needed and it is for this reason that our agency most strongly supports the

intent of H.R. 3465.

I would like to recommend that your committee expand the proposed definition . of the term "independent living rehabilitation services" to include recreational programs. It is apparent that one of the serious consequences of long-term disability, particularly those occurring at birth or in early childhood, is the lack of group experiences, which in turn often produce later difficulty in adjustment to work situations involving sharing with others in the accomplishment of a common task. We believe that for many individuals such group experiences can be extremely useful in assisting handicaped adults toward independent living by better preparing them for maximum participation in community life. It is an unhappy fact that few, if any, existing agencies such as community centers and Y's permit or encourage participation in their programs by handicapped adults. I would hope, therefore, that appropriate ways be found to include recreational services within the term "independent living rehabilitation services." I believe that the availability of funds would permit us to open the doors of existing recreational programs and, if needed, create additional services for this group with special needs.

I would also urge some clarification of section 206(b) as it pertains to "attendance in his household." I would hope that the intent of this provision is not to exclude those who may well achieve a degree of independence but who may require the somewhat protected environment of a foster home for a continued period of time. I further hope that persons would not be excluded who might live in independent apartments, perhaps with another handicapped person, where they might require some part-time and continued help for the

purposes of cleaning or assistance in meal preparation.

We believe that foster-home care, which has been so dramatically demonstrated in the field of the aged and the mentally ill, can substantially contribute toward the reduction of our hospitalized population and at the same time reduce the numbers of handicapped adults currently at home who will be institutionalized after the death of one or both parents. Unfortunately, under current policy, in New York City at least, the amount authorized through public assistance effectively precludes the possibility of finding suitable foster homes by establishing a maximum payment of \$100 per month. Many of my colleagues and I believe that if this rate were to be increased to \$160 or \$175

per month a number of handicapped persons would be able to leave hospitals where tax funds are now supplying between \$600 and \$700 per month. Perhaps the bill under consideration could be used to stimulate the development of such a program, which undoubtedly could produce a greater degree of independent living at a reduced cost to the taxpayer.

Thank you very much for this opportunity to present our point of view. We are convinced that H.R. 3465 represents a most significant step forward in the field of rehabilitation from both a humanitarian and business point of view.

(The following letter and statements were submitted:)

House of Representatives, Washington, D.C., November 9, 1959.

Hon. CARL ELLIOTT,

Chairman, Subcommittee on Special Education, Committee on Education and Labor, House Office Building, Washington, D.C.

Dear Congressman Elliott: I greatly regret that I was unable to be present at the hearings of your subcommittee in New York, October 28 and 29. Unfortunately, as you know, we had local elections coming up about that time and my calendar was very full.

However, I have great interest in the study of your subcommittee. The problem of rehabilitation and care of the handicapped is one meriting serious study. There are at present pressing needs in this field. A review and analysis of the inadequacy of present service to ascertain duplication and to determine future needs is, I am certain, a constructive first step. There appears room for reorganization, and perhaps new services. I know that New York has taken a lead in such programs and I support Governor Rockefeller's studies in this field.

I would be appreciative if this letter showing my concern for the problems and my sympathy with your studies should be inserted in the record of the New York hearings.

Sincerely yours,

BOR BARRY.

RECOMMENDATIONS OF THE CITIZENS' COMMITTEE FOR CHILDREN OF NEW YORK, INC.

The board of directors of the Citizens' Committee for Children of New York welcomes your invitation to submit recommendations concerning special education and rehabilitation of physically and mentally handicapped children and your request for comments on the bills now before your committee.

Many organizations concerned with specific aspects of this complex subject will be testifying on matters within their particular fields of interest and competence, such as teacher training, curriculum, school plant and equipment, or on the problems peculiar to patients suffering from the major disabling diseases. They are the immediate concern of national and local organizations devoted to their alleviation and eventual elimination.

We are not a specialized organization but are concerned with the improvement and effective coordination of all children's services. The Citizens' Committee for Children combines within its membership the professional knowledge and skills of experts in all phases of health, education, and welfare services to children and the interested participation of our informed, experienced lay members. Through its working sections—health, mental health, education, child-care, and protective services—it pools not only the knowledge and experience of its own membership but the benefits of consultation with an equally broad range of technical advisers, civic groups, and heads of operating agencies in all related fields. Our contribution to any consideration of specific needs and resources for the health, education, and welfare of children lies in this pooling of interdisciplinary professional experience and the thoughtful participation of civic leaders who must, in the long run, be responsible for interpretation and support of community programs.

CITIZENS' COMMITTEE ACTIVITIES IN THIS FIELD

It is in this context that we have undertaken projects in such related areas as school services for physically handicapped children, a community program for the mentally retarded, a mental health program for children, a pattern of

services for children in trouble. In each instance we visit the institutions and agencies involved and gather, evaluate, and report on pertinent data. We bring together those who are interested in and, in many instances, responsible for the quality and quantity of such services. The aim is to help crystallize from the various and often differing points of view a program that is geared to the growing child and his family in his home, neighborhood, and community.

BASIC PRINCIPLES

We should like to offer for your consideration certain basic principles which have guided us in our work for improved children's services and which may be of use to your committee as you review the numerous specialized proposals

that will come your way.

We recognize the great need for more and better services of all kinds but believe proliferation of services is in itself not the answer. Our basic concern is the child who is the recipient of community services. Unless services are adapted to the needs of the individual child and coordinated for his benefit, they will fail to serve his best interests. Similarly, while diagnosis without service is often an empty gesture, service without adequate diagnostic evaluation is not only unwise but often potentially harmful. Furthermore, special education for children with special needs cannot be provided effectively in school systems that do not provide adequately for the education of all the children in the community; nor can the handicapped child derive maximum benefit from special education that is not an integral part of the total community effort to help him and his family.

The underlying theme in all of this is community accountability, the assumption of responsibility for seeing to it that once a child is found to need help he is not lost amid the plethora of specialized, fragmented services that abound in most communities. For the handicapped, this begins with comprehensive diagnostic evaluation and planning in cooperation with the child's parents and includes regular medical supervision, periodic reevaluation and modification of

program—in school and out—as the child grows and his needs change.

COMMENT ON H.R. 3465

We therefore find ourselves in full agreement with the intent of H.R. 3465, which provides for the "evaluation of rehabilitation potentials and rehabilitation services to severely handicapped individuals," particularly section 302B providing for "an integrated program of medical, psychological, social, and vocational evaluation and services under competent professional supervision," and section 203(a) (7) which stresses "cooperation by the [responsible] State agency with and the utilization of services of all" the appropriate Federal, State, and local

agencies providing related services.

We might also point out that while rehabilitation services for those over 16 are obviously necessary, the earliest possible identification of the handicapped child, followed by diagnostic study, treatment, and appropriate educational, social, and vocational preparation are equally, if not more, important in the total lifespan of the individual. Vocational rehabilitation of the older adolescent and adult is thus dependent on the basic community health, education, and welfare services and the use which is made of them for the younger handicapped child, beginning as soon as a diagnosis can be made and continuing—with focus on the child—throughout his growing years.

While we applaud the inclusion of the mentally as well as the physically handicapped in H.R. 3645, we suggest that it might be well to define the term "mentally handicapped" more precisely. Too often in legislation and program planning, "mentally handicapped" is equated with "mental defect or retardation." This bill seems to us to include the mentally ill and emotionally handicapped as well as retarded, but may not be so interpreted unless it is clearly stipulated.

We should also like to call your attention to a growing group of young people for whom this bill might represent a veritable godsend but who are not mentioned specifically. These are the boys and girls of 16 and over who are coming out, or

¹Attached are two memorandums: "A Community Program for the Mentally Retarded," November 1955, and "Recommendations of Ad Hoc Group on School Services for Physically Handicapped Children in New York City," Mar. 26, 1956. While both are to some extent out of date and limited to the specific purpose for which they were prepared, we hope you will find them pertinent and useful, particularly since in the intervening years several of the major recommendations have been accepted and implemented.

rather, could come out of institutions, both bublic and private, if there were available the kinds of services outlined in the bill. For example, in addition to the children in State hospitals and State schools for the mentally retarded, there are many in institutions for the delinquent or neglected and in residential treatment centers for emotionally disturbed children who are mentally, emotionally, and socially disabled within the meaning of this bill who could, with the services herein provided, be helped to make a more adequate adjustment in the community and cease to be a burden on such families or portions thereof as they may have or on society at large.

We hope, too, that in the implementation of this bill the significant psychological and social components in the rehabilitation of the physically disabled will be stressed, so that States and local communities planning facilities for the physically handicapped will not only be encouraged but assisted in the provision of psychological evaluation, counseling, and social services to the physically handicapped. Similarly, we urge that rehabilitation programs, including workshops for the mentally ill and retarded not be confined to one or the other category or to the "mentally" or opposed to the "physically" handicapped. Recent experiments have demonstrated that arbitrary separation of the physically and mentally handicapped is not only unnecessary but often unwise, except as required by individual patients on the basis of thorough diagnostic evaluation.

COMMENT OF JOINT RESOLUTIONS 316 AND 494

Joint Resolutions 316 and 494, which are concerned with the training of teachers, speech pathologists, and audiologists for work with persons suffering from hearing and speech defects, are also worded in a manner which seems to us to give due consideration to the medical, social, emotional, and other aspects of rehabilitation, in addition to the educational aspects. We know of the shortage of trained workers—teachers and other specialists—not only for this group but for all other handicapped children; our members are involved in the training, recruitment, and supervision of all categories of personnel in this field. On this occasion, however, we would stress the social and emotional component, not only in the selection of those who are to work with these children but also in the selection of the children to be served.

Children with speech and hearing defects present a special diagnostic problem, as all who have worked with them must know. Hearing deficits vary within the individual child according to time, place, and circumstances; such variations are even more marked in those with speech defects. Differential diagnosis of the most careful sort is essential to the accurate identification of these children, and to their class assignment and program. The interplay of psychological and organic factors cannot be overemphasized and the teacher who would work with them must be helped to understand this.

ROLE OF THE FEDERAL GOVERNMENT

Bills of the kind proposed here have the added advantage of providing the Federal Government with the tools it must have if it is to help the States and, through them, the individual children in the local communities. They provide for grants-in-aid and, what is just as important, technical assistance. This cannot be stressed too strongly. Our national experience with the implementation of the 1946 extension of the Vocational Rehabilitation Act to include the mentally as well as the physically handicapped points up the pitfalls and shows us how to avoid them. Of prime importance in avoiding the timelag in implementation and the failure to interpret the Federal act as broadly as it was intended when written and passed, is the technical assistance to be provided by the Department of Health, Education, and Welfare.

This will require skilled staff in all the appropriate agencies of the Department as well as effective coordinating machinery at the Federal level to bring to bear on the individual to be served, the specialized knowledge, experience, and facilities of the entire Department. We have long stressed this at both State and local levels. As you may know, New York State now has an official coordinating mechanism for the kinds of services with which your committee is concerned. More remains to be done but at least the necessity for it has been recognized by statute.

Finally, may we thank you for making time available and express our regret that a prior commitment made it impossible for our representative to testify at the New York City hearings at the scheduled time. Documentation of the prin-

ciples outlined in this statement will, of course, be available to your committee on request and we will be happy to be called upon at your convenience for further discussion of implementation.

RECOMMENDATIONS OF AD HOC GROUP ON SCHOOL SERVICES FOR PHYSICALLY HANDI-CAPPED CHILDREN IN NEW YORK CITY

The New York City Board of Education and the Department of Health of the City of New York now operate programs which permit many physically handicapped children to attend school. There are 6,000 physically handicapped children under the supervision of the board of education. The handicaps include orthopedic, neuromuscular, neurological, cardiac, hearing, sight. However, many children (1,700 in New York City) are now homebound either because their handicaps are too severe for education in a regular school or because adequate services and transportation do not exist to bring them to the public schools. Studies have shown that many of these homebound children could profitably attend school. It is therefore recommended that the board of education and the department of health provide the necessary additional services and facilities for this group of children. Measures to strengthen services to all handicapped children at home or in special or regular classes should be implemented. At the same time an attempt must be made to keep all of the physically handicapped children as much as possible in the mainstream with other children.

Severely physically handicapped children require careful medical supervision and special physical facilities. In addition, special psychiatric factors must be considered. The goal in education of these children is to fill the child's needs. These needs are more difficult to meet than those of normal children. The school must deal with the problems which stem from the family where feelings of anxiety, fear, and guilt sometimes result in overprotection or other mishandling

of the child.

In addition, there is frequently lack of acceptance by other children in the community. The school must help the handicapped child to build up a realistic concept of himself through exposure to a variety of experiences. The handicapped child needs the support of his environment longer than the normal child and the parent and teacher must be helped to see when and where to withdraw their particular support.

Though the goal is to transfer as many of these children as possible into the "mainstream" as soon as possible, segregated programs are necessary until

the children are ready to go into regular programs.

Some of the recommendations which follow were included in the report of the commission for the study of crippled children in 1940 ("The Crippled

Child in New York City").

With the increase in the child population and a proportionate increase in the number of handicapped children, as well as increased knowledge of how best to rehabilitate the handicapped, it is even more urgent now to provide the necessary services.

I. IMPROVING QUALITY OF SERVICE IN EXISTING PROGRAMS

(A) School buildings: Additional space should be provided in existing buildings or buildings under construction to handle the children who should be served in the schools. (See II(A).)

(B) Planning for handicapped children to be effective must be comprehensive rather than segmented and should include all aspects—educational, psychological, medical and social. Individual planning must be done for each child.

(C) Health conservation classes: Since the vast majority of severely physically handicapped children are now in health conservation classes, steps must be taken to review the setup, program, and children in these classes. The services found necessary as a result of such review should be provided.

(D) More definitive and uniform criteria for admission and discharges of children to both the cerebral palsy units and the health conservation classes should be spelled out. No hard and fast criteria are possible since many factors including the emotional state of the child must be considered in the decision regarding placement.

(1) Whenever it is deemed necessary (within staff limitations), there should be a team review of children before admission, and "paper review"

of children should be eliminated.

(2) The possible extended use of facilities in the community, primarily

hospitals, for such study should be investigated.

(E) A flexible system should be worked out and instituted whereby physically handicapped children are easily transferred from one setting to another depending on their needs and abilities at any given time; for example, from institution or homebound to special classes or eventually to regular classes. (See II(D)(2).)

(F) Census of needs: Some steps have been taken to "review" the children who are now homebound or in special classes. However, it is suggested that—

(1) all children who are now homebound should be screened periodically on a pilot basis as soon as possible to determine how many could go to school if there were special facilities for them and what those services would have to be:

(2) all children now in special classes for the physically handicapped should be reviewed periodically by a team to determine how many could

be in regular classes;

(3) some attempt should be made to locate and review the children getting no service (children excluded from school and not on home in-

struction).

(G) Personnel: (1) Present teacher training and selection methods for those who will deal with handicapped children should be reviewed in view of the changing philosophy regarding the educational, social, psychological, and physical needs of the handicapped. In the light of changing concepts, the present staff assigned to handicapped classes should be reviewed. The problem of what constitutes a minimal training program for teachers of the handicapped should be explored (with the suggestion that practical experience should be an element in such training).

(2) Through the city colleges and other teacher-training institutions and inservice training courses, teachers and supervisors should be helped to gain greater understanding of the handicapped who will, we hope, in increasing numbers be students in their classes along with the normal children. All school personnel should be properly oriented to the philosophy of the school toward the

handicapped child.

The board of education gives inservice training to teachers of the physically handicapped and has issued a manual on the education of the physically limited child. However, much remains to be done with the regular teachers and supervisors in the schools.

(3) Extra incentives are needed to attract qualified and dedicated personnel to work with the handicapped since this work involves greater responsibility,

more tiring work, and longer hours than work in other settings.

(H) Psychological and psychiatric services: (1) Intensive counseling and vocational and other forms of guidance should be available for physically handicapped children as it is needed. As techniques are developed for proper vocational guidance for the younger age group, these should be available to the physically handicapped children.

(a) Counseling should be available to parents as well as children.

(b) The possibilities of using other public or private agencies in counsel-

ing should be explored.

(2) More psychiatric guidance services must be provided to deal with the many problems which arise in a program for physically handicapped children. A psychiatrist should be available for consultation with "the team" which screens and services physically handicapped children. The possibility of making wider use of clinical facilities in hospitals should be studied.

II. NEEDED EXPANSION OF SERVICES

The present practice is to limit enrollment in special classes for severely orthopedically handicapped children to those with cerebral palsy; all other children with severe orthopedic handicaps are now excluded:

Wheelchair cases are not permitted in any classes except those for cerebral

palsy.

Children in other classes for the handicapped, called health conservation classes, must be able to get on and off the bus without assistance, while limousines bring the cerebral palsy children to school.

With a view toward providing education in the schools for some of the other children who are now homebound, the following recommendations are made:

(A) School buildings: Plans for new schools or remodeling existing schools

should include:

(1) Units on the ground floor in a few schools in each borough for the physically handicapped; special facilities, including rails, ramps instead of steps at the entrance, bathrooms with rails and wide doors.

(2) Most schools should have one or more classrooms built on the ground or with wide doorways so that if they are needed for the physically handicapped, they are available; if not, they can be used for regular

classes.

(B) Expanded program for severely playsically handicapped: A pilot project in which present cerebral palsy school units would be expanded to screen and care for a group of severely handicapped children with other disabilities should be started. Such a pilot project would show the needs of other handicapped children, some of whom are now homebound or in institutions. Additional staff (medical, social workers, psychologists, teachers, therapists, etc.) will be required to screen and care for these children in this expanded program. The same team screening methods and the same techniques of team approach can be used in these enlarged units. If this pilot project shows that these other groups of severely handicapped children can take part in a school program, special units should be set up in each borough with all of the necessary facilities and trained staff to care for them.

(C) High school classes: The special facilities for severely handicapped children should be extended through high school since many orthopedically handicapped children must now become homebound when they reach high school age. Some special services do exist for the blind, partially sighted and deaf, and

some cardiac children do attend high school.

III. TRANSPORTATION

Available transportation facilities will, in part, determine which children can go to school. In addition, some of the children spend hours in the school burs. Therefore, it is important to improve transportation services for the physically handicapped in many ways, following the recommendations in the welfare and health council study on transportation of handicapped children.

(Memorandum to Senator Earl W. Brydges, chairman, Joint Legislative Committee on Mental Retardation, from the Citizens' Committee for Children of New York City, Inc.)

SUBJECT: A COMMUNITY PROGRAM FOR THE MENTALLY RETARDED

BACKGROUND

The Citizens' Committee for Children of New York City is an organization of lay and professional persons who are deeply interested in the quality and quantity of services for children in New York City and who bring to the work of this organization a wide range of expert knowledge and experience in all phases of health, education, and welfare. The Citizens' Committee has worked long and hard for the improvement of our community services, and in each instance has based its efforts on factfinding, research, expert consultation, and constructive working relationships with the appropriate public and voluntary organizations and professional groups.

In the course of our efforts to stimulate public interest in meeting the unmet needs of all the children, we have consistently given particular attention to those children who have special needs. We believe that the mentally retarded have very special needs which have not been met. For some time the Citizens' Committee has been deeply concerned with the tragic problems faced by the mentally retarded and their parents, and, more recently, a subcommittee of experts in health, education, and mental health has been working intensively on the subject. The subcommittee has reviewed the literature, visited service programs,

and conferred with National, State, and local specialists in the field.

As you know, the Citizens' Committee has in the past recommended certain long-range programs for this group of children and has suggested various approaches to their achievement. We have prepared annual statements for consideration by the legislature and were pleased to find that several of the specific recommendations contained in these statements have been implemented. However, they represent only first steps in a long journey, and much more needs to be done.

The Citizens' Committee was particularly pleased to learn of the appointment of this joint legislative committee on mental retardation under your leadership because it is such a clear indication of a growing recognition of the importance, severity, and complexity of the problem. Your long interest in finding solutions for these problems is our assurance that the joint legislative committee may well be the catalytic agent which has so long been lacking in this field.

SCOPE OF THIS MEMORANDUM

Our subcommittee on program for the mentally retarded is working intensively on specific recommendations for the implementation of the comprehensive community program for the mentally retarded which was outlined in our earlier statements. The subcommittee has not yet completed its final report to the board of directors of the Citizens' Committee for approval and subsequent release. We shall, of course, be happy to make it available to the joint legislative committee immediately thereafter.

In the meantime, however, the Citizens' Committee for Children is in a position to point out and define certain areas of major priority and fundamental importance to any program that is now contemplated or may eventually be adopted. The nature of these priorities is clearly indicated by the following three major problems which must be faced and resolved if services for the mentally retarded are to move forward in an organized, coordinated program:

I. There is today no formal recognized coordination between or among Federal, State, and local public agencies or between public and voluntary programs in this field; this has resulted in confusion, duplication, and overlapping serv-

ices on the one hand and great unfilled gaps in service on the other.

II. There is today no clear allocation of public responsibility in the local community for early case finding, comprehensive diagnosis, or parent counseling, or for the establishment and coordination of the wide range of services that are known to be needed by the mentally retarded and their families.

III. There is today no organized program for public and professional education about mental retardation and about the needs of persons found to be mentally retarded. Nor is there an organized program of recruitment and training of professional personnel who are so desperately needed in this field. There is a similar lack of organized, coordinated research.

ELABORATION

I. Coordination of public and voluntary programs.—The mentally retarded and their families have in the past been served by a number of different public and voluntary agencies, but seldom in a coordinated fashion and for the most part inadequately. Since the needs of the mentally retarded—as of all children and adults—cut across formal agency lines and since, in the case of the mentally retarded, their needs are greater and more complex than those of the average citizen, it is almost a platitude to say that they would be better

served if agency programs were coordinated.

However, the fact remains that coordination is almost nonexistent. This is true of all levels of government. For example: In the Department of Health, Education, and Welfare, the Children's Bureau, the U.S. Office of Education, the Office of Vocational Rehabilitation, the National Institute of Mental Health, and the National Institute of Neurological Diseases and Blindness have all received appropriations to increase and intensify their efforts in behalf of the mentally retarded. All of these agencies are making grants to various State departments and to local public and voluntary agencies with little or no clearance among themselves. (See Social Legislation Information Service, Issue No. 33, September 30, 1955, for an account of recent appropriations to the constituent agencies of the Department of Health, Education, and Welfare.) There is a new Federal commission which is charged with responsibility for coordinating research, but, so far as can be determined, there is no coordination of actual program planning, grants-in-aid, consultation to States or other services.

At the State level the departments of correction, education, health, mental hygiene, and social welfare are involved in one way or another in services to mentally retarded individuals but with no formal, recognized integration in planning services or in channeling Federal or State funds to local communities. The nearest approach to coordination is in the mental health commission, which is due to terminate in 1956 unless its life is renewed. This is, however, largely a research responsibility at the moment rather than service. The commission was asked to carry out studies of mental retardation for which funds were appropriated in 1953. It is also concerned with study and evaluation of the experimental classes for the severely retarded which were established in 1954. Obviously, such evaluation is prerequisite to sound planning of statewide policy with respect to the educational needs of the severely retarded.

However, on a practical level the State departments of mental hygiene and social welfare, for example, are expected to set up educational programs for the children in their institutions without supervision by or consultation from the State department of education. Similarly, there is no provision for consulation from the State department of mental hygiene to the State department of education in its operation of special classes either under the old law or the newly enacted 1955 amendment to the State education law, which enables local school districts to establish special classes for the severely retarded.

The appointment of this joint legislative committee on mental retardation is evidence of the need for clarification and coordination. The committee has an unparalleled opportunity to make recommendations bearing on such coordination.

tion at the State level.

On the local level there is no official structure to coordinate the various services which might be found necessary for the severely retarded individual. There is no structure which makes the State institution a member of the community which it serves, nor is the institution now expected to participate in the selection of persons to be admitted to its care. It is only after a child finally arrives at the institution that he is fully studied, and it may then be found that he should not have been admitted. Often, too, parents regret their decision to institutionalize a child and may remove him, only to find that they are unable to cope with the situation. For children under 5 years of age there is a long waiting list, although efforts are made to interview the parents in order to help them reach a decision about placement and to determine priorities for admission to Willowbrook (for New York City children). Subsequently, however, many young children may remain on the waiting list for months, even years, until they reach the age of 5 and are eligible for admission to Letchworth or Wassaic. During this waiting period there is no publicly sponsored help available for the parents or for the child whose original referral to a State institution was often based on no more than a psychometric examination rather than comprehensive diagnostic study.

II. Responsibility for early case finding, comprehensive diagnosis, parent counseling, and related services.—The lack of clear allocation of public responsibility in this area is a crucial stumbling block to the development of a sound program. It is imperative that there be provision for early case finding and that a well-rounded diagnostic service be available to all children who are thought to be mentally retarded. Such a diagnostic service must include thorough physical, neurological, psychiatric, psychometric, and social evaluation by qualified personnel working together and with the parents to determine the nature and extent of the disability, its causes, and an optimal program of care and treat-

ment for each child.

It is essential that such diagnostic services be accompanied and followed by counseling to help the parents understand and take appropriate action based on the findings. It is equally important that there be provision for subsequent review of the child's progress and that the parents have access to advice and guidance as the situation in a given family changes from time to time during the life of a severely retarded individual who may be either at home or in an

institution.

Differential diagnosis implies the use of a high level of technical knowledge and skill in arriving at an evaluation of a given situation. It also implies the availability of differentiated services as required by the individual. It has been demonstrated that where early comprehensive diagnosis is available for children thought to be intellectually retarded, the findings are often so diversified that a wide range of services is clearly indicated. Among any group of children who appear to be intellectually retarded there will be some who are found to be

psychotic or emotionally disturbed rather than mentally defective; some who are only moderately retarded but so disturbed as to be unable to function at full capacity without psychiatric help; some who are mentally retarded but whose social and emotional adjustment and family situation are such as to warrant the assumption that with education and training they will become reasonably self-supporting, independent members of the community; some with organic conditions amenable to treatment and, therefore, likely to be able to function at progressively higher levels; some whose mental defect is severe but who can, with treatment, education, and/or training, learn to be reasonably self-sufficient within a protected environment either at home or in an institution; and some who will require custodial care for life.

This wide range of diagnostic findings obviously points to the need for a wide range of services. They may include psychotherapy, either ambulatory or inpatient; chemotherapy; neurosurgery; modified recreational facilities; modified educational and training facilities; day care or day hospital services; vocational guidance and training; sheltered workshops; temporary or permanent institutional care; family care; financial or legal assistance; and, in all cases where the individual's mental defect is such as to render him incapable of achieving ultimate responsibility for his own behavior and welfare, there must be available to the parents the services of an agency to which they can turn for help as the situation changes. The use of any or all of these services must, of course, depend on the readiness of the parents, which, in turn, may largely depend on sound professional counseling and support.

Unfortunately, in New York City, and to the best of our knowledge in the remainder of the State as well, there is no provision for a diversified program of this kind. Except as parent groups have initiated them or have stimulated local support for specific services, they are largely nonexistent. There is no provision for the use of State institutions on a temporary basis as part of an ongoing plan which would include, of course, continuing guidance for the parents. There is no provision for day care, training, sheltered workshops, as part of a total program for the severely retarded, and, as we know, the resources of the community which are available to all other children are often closed to these children.

The problem of educational or training facilities for the mentally retarded has received much attention of late. It should not, of course, be considered in isolation since it is one—and only one—of a wide range of interdependent services which should be available for the mentally retarded, but it is a good example of the lack of coordination in our local communities. With the exception of New York City and a few upstate school districts, the education law which requires that special public school classes be provided for the "educable" mentally retarded has not been carried out. Similarly, the implementation of the 1955 amendment to the education law which permits school districts to establish special classes for the severely retarded, often termed "trainable," may well be delayed indefinitely in many school districts even for those who are found to be capable of attending such classes. On the other hand, if there were a coordinated program at the State level it would be possible to provide consultation to local units of government, drawing on the best thinking and experience of education, health, mental hygiene, and welfare to help the local community formulate and carry out sound plans for all the necessary services, including education. Basic to any such plan, of course, is the need for adequate diagnostic facilities which may or may not be available at the local level but could be made available by the State.

As for local responsibility, it is essential that it be fixed in some branch of government which would also have the authority and the funds to carry out such a program. In the opinion of some, this responsibility might be lodged in the local community mental health boards. By law, "mental defect" is one of the "psychiatric disorders" for the care and treatment of which the community mental health boards have been given responsibility. Furthermore, the "rehabilitation of persons suffering from psychiatric disorder"—the social, vocational, and other services likely to ameliorate the effects of the handicap—is clearly spelled out as reimbursable under category IV of the Community Mental Health Services Act. There may be some question as to whether ongoing services of this kind might not place too great a financial burden on the community mental health boards and thereby lessen their overall usefulness to their communities. On the other hand, we know that adequate diagnostic services will screen out of the larger group those who are not actually mentally defective and leave a smaller residue of ongoing cases. We know, too, that in the few clinics which in-

vite such an ongoing relationship with parents the results have been highly satisfactory: Once the initial diagnostic and treatment service and parent counseling and home training program are completed, the parents turn to the clinic only when a valid emergency or serious problem arises. The reassurance that comes from the knowledge that this resource is always available relieves anxiety and

insures against the inappropriate use of the clinic's facilities.

III. Public and professional education.—Personnel and facilities for the care and treatment of the mentally retarded have long been inadequate. Furthermore, the growth of these resources has lagged far behind that of other public services—for the mentally ill or physically handicapped—and has never been commensurate with the size and severity of the problem. Recruitment of staff has been handicapped by the inadequacies in the field, which in turn are intensified by the failure to attract and hold young people. Until recently appropriations for research and training in this field have lagged behind those in other aspects of health and mental health, with the result that fewer and fewer people are available to serve more and more applicants for service, and except for the relatively few research-minded workers who have persisted in their efforts through the years, research has made little progress.

Furthermore, there is a widespread lack of interest on the part of health and welfare personnel which will not be overcome so long as the current ignorance and aversion to the subject is permitted to continue. Too little is taught in professional training schools of medicine, nursing, social work, and psychology about the range and diversity of emotional, neurological, physical, and social factors to be considered in planning for children who are today roughly diagnosed as mentally retarded. The tendency to lump together all children who are labeled "mentally retarded" is apparent in the general reliance on psychometric examinations as the sole criterion for admission to public schools or institutions. Whereas a "low IQ" should be no more than a signal that full diagnostic study is required, it is all too often considered the equivalent of a diagnosis. tendency on the part of physicians, nurses, and others either to urge early institutionalization or to advise against it, without giving parents the help they need to make a sound decision, is another symptom of the fairly general professional ignorance. Teacher-training institutions still provide little in the way of preparation for work with the mentally retarded and almost nothing for work with the severely retarded.

A program which is based on sound comprehensive diagnosis, realistic planning, and guidance for parents will provide an opportunity for professional training that should have a salutary effect on the general level of understanding While ultimately it is to be hoped that general hospital and health department clinics and child guidance clinics will accept and provide help for the mentally retarded and their parents, it is too much to expect that this will happen without the stimulation and example provided by specialized services with facilities for professional training. At the same time, efforts must be made to stimulate the inclusion of more imaginative and current material about mental retardation in the professional training programs of the appropriate groups. Experimental programs must be extended and studied carefully and the findings funneled back into the professional training of teachers and other groups who might carry responsibility for programs of education, vocational guidance, training, and supervised workshops, among others. The recruitment problem must be attacked vigorously through the use of all the devices that have been developed in other fields and through specialized incentive programs to overcome the

obstacles which are unique in this field.

Public ignorance and lack of interest is, if anything, more extensive than that of professional personnel. The activities of parent groups, locally and nationally have done much to interpret the nature of the problem, but they need the help of professional organizations and public agencies which also have a responsibility for sound public education. A well-organized, systematic program of public education is essential to the achievement of any or all of these goals. burden which is carried by parents of severely retarded children is very great but its impact can be lessened if their neighbors and fellow citizens are helped to understand and as a result of their understanding provide a community setting which is conducive to the maximum development of which each retarded child is capable. Not only would a successful educational program provide informed public support for more adequate services but also, and equally important, it would provide for the overburdened parents and their handicapped children an atmosphere of acceptance and encouragement which is all too infrequent today.

RECOMMENDATIONS

We therefore recommend that the joint legislative committee on mental retardation use its facilities to gather data and where necessary prepare appro-

priate legislation and/or provide funds to achieve the following:

I. Coordination of public programs and voluntary services to the end that New York State and its local communities may establish and maintain an overall program to meet the needs of all persons who are found to be mentally retarded: Through the good offices of a coordinating agency—commission, interdepartmental council, or some other unit with sufficient authority, personnel, and funds—each State department would be enabled to contribute to the total program from its own area of competence and all would benefit from consultation, clearance, and the establishment of joint programs in areas of mutual concern. Similarly, the relationships of State departments to their own local units and to the units of other departments giving service to the mentally retarded would be greatly facilitated by the presence at the State level of such a commission or council.

II. Allocation of responsibility for early case finding, diagnosis, parent counseling, and related services to the appropriate local unit of government with sufficient authority, personnel, and funds to enable that unit of government to carry out this responsibility: Among the major functions of this unit of government would be the establishment of diagnostic and counseling services either through the expansion of existing facilities or the development of new facilities; the establishment of machinery for the review and evaluation of existing services and the development of diversified new services as required; the provision of ongoing counseling for parents; and coordination of local services. It is understood, of course, that local units would have the advantage of a close work-

ing relationship with the aforementioned coordinating agency.

III. Public and professional education, through the combined efforts of public departments, professional groups, voluntary agencies, parent groups, and other citizen organizations who are active in the field: Here, too, the coordinating agency at State level and the responsible units in local communities would be invaluable in spearheading and providing material for public education and particularly for a concerted drive to improve the quality and quantity of teaching about mental retardation in all the professional training schools in the State.

STATE UNIVERSITY OF NEW YORK,

COLLEGE FOR TEACHERS,

Buffalo. November 2. 1959.

Hon. CARL ELLIOTT, Seventh District, Alabama, House of Representatives, Washington, D.C.

Dear Representative Elliott: In view of my having to cancel my appearance before your committee on October 29, 1959, I should like to write down several of my views on the matter of overall needs in special education as suggested in your earlier letters.

I wish somehow there were a simple, neat, concise package saying, "R—National Plan for Solution of Special Education Needs." As with all problems that people want solved immediately, there apparently is no direct or quick solution. Special education demands attention from any number of services in

each State.

The longer that one works in the areas of exceptionality, the stronger becomes his conviction that any operation which attempts to solve problems arising from being "different," must be a well-integrated one which moves into several fields at once. For example, it is not easy to talk about meeting the needs of severely retarded children without asking: Who is to pay for this service? Who is to provide space and teachers? Where does this program fit in the general school provisions for the mentally retarded from 50 to 75 IQ? What implications for the teacher training institutions does such a program imply?—and so on. This small segment of the condition we call mental retardation obviously involves more people and institutions than the school; multiply this by other problems of exceptionality and the magnitude of the problem may be seen.

As we work through an overview of a program it might be profitable to think of the needs of several groups that make up exceptional children. These groups might fall into the following categories:

(a) Those children who will be unable ever to function as adults at

private competitive levels.

(b) Those children who, while able to function at a competitive level, come from environments which are so poor that their chances to "make it" are impossible.

(c) Those children who can compete in an independent or semi-independ-

ent way with the help of special education facilities.

When one thinks of a program designed to meet the needs of these children, one is led inevitably to the need of developing and maintaining the following:

(a) A continuous and compulsory census similar to that carried out for

the blind and deaf.

(b) Some custodial provision for those unable to compete in the work world that we knew.

(c) Some training facility for those children who come from environ-

ments which depress their chances for success.

(d) Special education facilities—public and private—for those children able to maintain themselves as independent and semi-independent citizens. In setting up the above, such allied fields that contribute to the solution become vivid: medical services, psychiatric services, school services, institution services, and teacher training services.

Since it is the purpose of your committee to ascertain the "filler" under each of these headings of service, I shall indicate briefly some of the assists which we would hope a teacher training institution could provide with the proper moneys,

staff, and facilities: (a) Education program designed to prepare teachers, attendants, administrators, and workers to meet the needs of the various groups outlined.

(b) Internships and assistantships in the field of mental retardation with

allied community agencies.

(c) Research developed from hypotheses of workers and students in the field.

(d) Consultant services to community and State agencies engaged in , work in the field of mental deficiency.

While it is always easy to outline a series of objectives to be striven for, it is only fair, for example, to point up that at present our own State does not have an adequate training program for workers or teachers of exceptional children. Cf the 11 State colleges of education, Buffalo and Geneseo are the only two which offer undergraduate curriculums training teachers for the mentally retarded and speech defectives. Buffalo, in addition, is the only unit of State University which has a program for teachers of children with physical handicaps. This focuses, then, on the major problem in this field—shortages of personnel.

To again use one aspect of the field of exceptionality—mental retardation: In the past 5 years we have graduated from our college only 81 students certified to teach the retarded. The job requests from New York State alone for these candidates has been over 2,318, a shortage of over 2,000 teachers in New York State alone. It is naive to believe that continued shortages will enable us to implement the several goals which are outlined in the field of research, assistantships, consultant services, and well-integrated educational programs without concerted assistance from the State and Federal Government in terms of possibly moneys, facilities, and/or staff.

I suspect, then, what I am saying is that the most crucial pressure that special education faces is not a shortage of ideas and sensible programs but rather a shortage of manpower. I am enclosing a 1958 outline of the problem as I developed it for the New York State Joint Legislative Committee on Mental Retardation. Perhaps after a review of this material by your professional staff there may be further questions I might answer for the committee. I hope you will feel free to call upon me for any further clarification on the materials I

have enclosed.

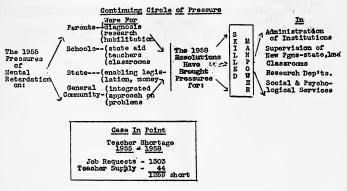

I regret that I could not attend the New York City hearings which I understand were profitable and well attended by several of my colleagues.

Sincerely,

State University of New York College for Tembers Buffelo, New York

EXCEPTIONAL CHILDREN EDUCATION DIVISION

Dr. Horace Hann Director

The Years Ahead

Recommended Explorations

Review Pressures for priority action--legislative approach to be overall or pinpointed

Develop legislative committment for development of personnel program in several fields

Set longterm deadlines for the decade ahead

For Immediate Review in Teacher Education Shortage

Provide recruitment assistance through contracting public relations personnel for development programs

Continue and enlarge scholarship grant program so as to cover not only seniors but freshmen as well

Insist that demonstration centers be established at teacher educating institutions of higher learning

Allocate fellowships for graduate students enturing college teaching with exceptional children

STATE UNIVERSITY OF NEW YORK,
COLLEGE FOR TEACHERS,
EXCEPTIONAL CHILDREN EDUCATION DIVISION,
Buffalo, October 9, 1958.

JOINT LEGISLATIVE COMMITTEE MEETING—WHAT NEXT STEPS IN MENTAL RETARDATION FOR NEW YORK STATE?

(By Dr. H. Mann)

I. HEARING OF OCTOBER 28, 1955

- A. I outlined several pressures which retardation brought for-
 - Parents: Diagnostic service, schools, research, day care, workshops.
 Schools: Space, teachers, identification, guidance developmental programs.
 - 3. State: Money, positions, scholarships, institutions, leadership.
 - General community: Research, improved facilities, referral agencies, long-range guidance.

B. Since 1955 the committee has helped to achieve relief from many of these pressures by obtaining—

 Parents: Relief from institutional liability, permissive education for trainable children, research grauts, clinics, 5 to 21 care, removal of "poor indigent" as admission criteria to institutions.

Schools: Increased State-aid formula, expansion of cooperative boards, support for psychological services, teacher training relief in scholarship grants.

3. State: Scholarship grants for teacher training, continuing census, permanent joint legislative committee, demonstration centers.

4. General community: Diagnostic centers, institutional crowding relief, research institute for mental retardation, publication of legislative reports focusing and highlighting problems and solutions.

The legislative approach has been a concerted, well-integrated plan for relieving many rather than single points of pressure. Such progress reflects clear and perceptive understanding of the overall nature of the problems arising from mental retardation.

II. WHERE TOMORROW? (1958-PLUS)

- A. Nature of pressures remaining (all interrelated):
 - Monetary: New moneys needed for transportation, salaries, services, institutions, buildings.
 - 2. Physical: Enlarged facilities—administrative-institutional, general equipment, and research plant needs.

 General (pervasive): Manpower.
- B. Which must receive priority in our creative planning?
 - 1. I submit "manpower" as primary.
 - 2. Service ultimately rests in people (for institutions, classrooms, diagnostic centers, rehabilitation workshops, etc.).
 - 3. Appropriations for buildings, plants, research all become empty promise without needed manpower to implement objectives sought.
- III. MANPOWER SHORTAGE REFLECTED IN BUT ONE ASPECT OF PROBLEM—TEACHER. SUPPLY
 - A. National picture:
 - 1. Survey (10-year estimate):
 - (a) 20,000 teachers for educable and trainable.
 - (b) 2,000 per year needed.
 - 2. Actual graduates of 1953 survey among the 40 colleges training teachers in mental retardation:

Degrees granted.	
Undergraduate bachelors	151
Graduate:	
Masters	130
Doctors	4
Total	285
Shortage	1715

Snortage.

It should be noted that the estimated number of teachers does not include college needs for teacher educators.

B. New York State picture:

1. 1958 statistics (January):	1 001
(a) Educable	1, 391
(b) Trainable	95

- C. Local teachers education picture at Buffalo:
- General divisional enrollment over 5-year period (freshman, sophomore, junior, senior)

	Majors in all fields of ex- ceptional children	Percent col- lege enroll- ment	Staff
1983	72 144 149 197 257 306	3.5 6.5 6.1 7.9 9.9	3 3 3 5 5 7

2. Mental retardation figures, New York State

	Graduated in	Job requests for
1953. 1954. 1955. 1956. 1957.	4 7 8 8 12 12	70 75 125 215 438 525
TotalShortage	51 1,	1, 448 397

Vivid evidence that manpower problem remains after much of the legislative progress has been made.

IV. IMPLICATIONS

A. A review of the present overall approach to legislative relief of pressures arising from mental retardation should be undertaken. In short, should we continue to advance on all fronts, inching forward everywhere, or should we concentrate what available energy and moneys are available to attacking the pervasive personnel shortages in all phases of this work—teachers, psychologists, social workers, etc.?

B. A drastic and stepped-up plan will be needed if we are to achieve adequately staffed schoolrooms, in both public and institutional settings, for the

mentally retarded.

C. A philosophical commitment regarding the role the State legislature is willing to play in enhancing and promoting existing teacher educating facilities in this field must be thought through so agencies in local communities can plan ahead realistically.

D. A projected plan for the decade ahead should be examined so that achievement deadlines may be explored with a view to planning necessary ameliorative assistance on both State and local levels.

V. POSSIBLE AVENUES FOR IMMEDIATE INVESTIGATION DIRECTLY RELATED TO PERSONNEL SHORTAGE

A. Recruitment assistance—either through direct or contracted subsidy—for developing materials and publicity for high-school persons, college students, and already trained teachers in other fields.

B. Enlarged scholarship program with sufficient funds to dip down to the freshman year for the potentially interested student in mental retardation.

C. Vivid development of demonstration facilities—as the projected day-care centers for the retarded—on the teacher educating campuses so that recruitment, research, and practice may be enhanced. (We are told that by 1968 we will have a special education building.) In short, a way must be devised to bring early enlarged and improved specialized facilities to institutions preparing persons as teachers in this work.

D. The creative arrangement—as was done with Smith-Hughes Act or as with present Federal rehabilitation programs on national levels—whereby the State can subsidize and enlarge teacher education staffs on campuses where limited enrollments do not provide for such personnel on a student-faculty ratio. (Salary competition from public and private schools, research projects, and foundation agencies in this work often make it impossible to win the competitive fight for college personnel.)

ADDENDUM

I am adding the following merely to reenforce the importance of strong action taken soon in the recruitment picture for not only public school teachers but college personnel, too.

Why is recruitment difficult?

I. Nature of task you need done (a teacher training institution in field of exceptional children education should sponsor and develop):

A. Education programs designed to prepared teachers, administrators, and

workers to meet the needs of exceptional children.

B. Intern and assistantships in those community agencies engaged in the field.

C. Research from hypotheses of workers and students in exceptional children education or allied disciplines.

D. Consultant services to community and State agencies in need of such assistance.

II. Quality personnel needed to achieve these goals (criteria we use for hiring):

(a) Teaching experience with retarded, minimum 3 years.

(b) Teaching experience in college, 2 years.

(c) Doctorate work in special education (about 8 to 10 years' preparation).

(d) Experience in community and research activities.

· III. What we have to buy with (BSTC):

 Rank :
 Range

 A. Professor...
 \$7,206-\$8,586

 B. Associate professor...
 5,976-7,206

 C. Assistant professor...
 5,100-6,210

Neighboring schools often hire our beginning teachers in mental retardation from \$4.700 up.

STATEMENT BY DR. HOWARD A. RUSK, NEW YORK UNIVERSITY-BELLEVUE MEDICAL CENTER

My name is Howard A. Rusk. I am a physician and am professor and chairman, Department of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center; director, Institute of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center; and associate editor, the New York Times. I am or have been associated with a large number of national and international organizations, professional and voluntary, concerned with rehabilitation services for the physically handicapped.

As a physician and citizen, I should like to go on record as being strongly in favor of all the provisions of the Rehabilitation Act of 1959. All of these provisions—evaluation services, independent living, workshops and other rehabilitation facilities, research and demonstration, President's Committee, and extension and improvement—are, in my opinion, sound measures which will contribute substantially to our national goal of providing maximum rehabilitation opportunities for all of our disabled citizens who can profit by such opportunities.

I should like in this statement, however, to confine my remarks to those provisions of the Rehabilitation Act of 1959 pertaining to "Independent Living."

When the Vocational Rehabilitation Act of 1954 was enacted I had the privilege of discussing this extremely important legislation with a great many Members of the Congress, the administration, professional leader in rehabilitation, and interested citizens. At that time I stated both publicly and privately that the next great objective in our national program of rehabilitation should be a program of the kind which would be provided for under the independent living provisions of the Rehabilitation Act of 1959.

I am sure that much of the extreme significance which I attached to these proposals is the result of my experience since 1946 as director of the Physical

Medicine and Rehabilitation Service of Bellevue Hospital and as consultant in rehabilitation to the Department of Hospitals of the City of New York. The Physical Medicine and Rehabilitation Service of the New York City Department of Hospitals is the largest non-Federal service of its kind in the world. The Physical Medicine and Rehabilitation Service at Bellevue Hospital developed in 1946 on the basis of the wartime experience of the Army Air Forces and, patterned on the recommendations of the Baruch Committee on Physical Medicine and Rehabilitation, was the first comprehensive integrated rehabilitation service for inpatients in any civilian hospital in the world. Today within the municipal hospital system of the city of New York there are 9 rehabilitation centers with a total of over 1,000 beds.

Each year these rehabilitation services, which are available to all medically indigent residents of the city of New York, provide comprehensive rehabilitation services for several thousand severely disabled persons who have been determined to lack sufficient vocational potentials as to be eligible for services under the State-Federal program of vocational rehabilitation. But we know from this over 13 years of experience that return to employment is not the only valid goal of rehabilitation. Among our population there are several millions of chronically disabled persons for whom age, extent of disability, or personal desires preclude a return to remunerative employment. But many of these persons can be rehabilitated to the status of partial or complete independent living. It is also apparent that the number of such persons will increase in the future rather than decrease.

Until the last 50 years, the saving of human life as the traditional and cherished goal of medicine was largely a matter of saving individual patients. With the first half of the 20th century, the whole character of medicine's goal changed. The expansion of research into the etiology and therapy of communicable and infectious diseases "struck specifics." The establishment of new and effective public health measures and the rich findings in the basic fields reported elsewhere in this publication gave the lifesaving functions of medicine mass pro-

portions.

These, combined with similar advances in greater availability of medical and hospital care, improved nutrition, increased education, better housing, and all the contributing factors to our unprecedented current standard of living in the developed parts of the world mean hundreds of thousands of persons are alive today who would have died at the turn of the century with the same medical problems.

In 1950, at the end of the first half of this century, a number of our more mature national leaders were asked what they considered the most significant developments that occurred in the first half of this century. With the sagacity which usually marks his comments, Mr. Bernard M. Baruch ranked the prolongation of the lifespan in the United States by 18 years within a period of 50 years as having more implications for this and future generations than such technical developments as improved communication and transportation, mass production techniques, and the development of nuclear energy.

Today we have in our population 15 million persons beyond the age of 65. By 1970 their numbers will have grown to between 20 and 25 million. Life expectance has increased from 49 in 1900 to 67 in 1950 and today has reached the

legendary threescore and ten.

Although the further extension of life expectancy during the next 20 years will not be as great as in the past two decades, the growing number of older persons in our population and the resulting increased incidence of both chronic disease and chronic disability will without doubt be among the most serious challenges facing medicine.

Although the pathology of many of the chronic diseases remains at present irreversible, experience has shown that the social, emotional, and vocational

sequelae of these diseases need not be.

Although chronic disability strikes persons of all ages, those in the upper age brackets are its particular targets. Today on every hand we see hundreds of thousands of these older persons who have been allowed to become unnecessarily dependent. These patients are absorbing the services of vast scores of health personnel in hospitals, nursing homes, and in their own homes and of members of their families who could be freed for other essential services if opportunities for rehabilitation for independent living were available to them.

The Commission on Chronic Illness has estimated that on any given day there are about 1,100,000 long-term patients in our institutions. In addition, there

are an estimated 45,000 long-term patients in short-term general hospitals and hundreds of thousands of persons who are confined to their own homes because of disability.

One of the major problems now confronting medicine which will be further accentuated in the next 20 years by the growing incidence of chronic disease and chronic disability is how these services can be brought most effectively and most economically to those patients needing them.

Physicians, hospitals, social workers, community agencies, and families err constantly in the loose interpretation of the term "chronic illness." A recent Government publication states that "In 1950, 17 in every 100 persons aged 65 and over were estimated to have long-term chronic illness, as compared to 3 or 4 percent per 100 among the general population."

Among this 17 in every 100 persons aged 65 and over, there are many who are "chronically Ill' in that they require continuing medical services of the type which can be provided only or best within a hospital. Among them, however, are others who are "chronically disabled" in that although they have static physical impairments (such as hemiplegia following stroke), they are not in need of continuing hospital care. But since there is no place else for them to go, they are forced to live for months or years in an environment where pain and death are a part of the daily routine.

This situation was brought into the professional spotlight recently by a study conducted under the auspices of the New York Foundation at Goldwater Memorial Hospital, a municipal hospital of the city of New York. In this study of 95 unselected cases (average age of 68.5 years), it was found after intensive medical, social psychological, and economic evaluation that only 7 were felt to be in need of continuing hospitalization; and 2 of these cases were considerably questionable. Using the customary rehabilitation standards, 11 patients were considered suitable for rehabilitation with a better than 50-50 prospect of success. The remaining 84 of the original 95 patients were considered to be in no need of either rehabilitation or definitive medical care.

An analysis of but three of these patients showed they alone had been cared for in municipal facilities for a total of nearly 19,000 days. Calculating arbitrarily and conservatively at \$12 per day as cost of their care, the total cost of these three patients alone to that point was \$228,000 and the end was not in sight.

This is a sizable sum, but it is only money. What about the cost to these individuals in boredom, anxiety, frustration, and resignation?

If any major attack is to be made on the problems of chronic disability, there must be provisions for rehabilitation opportunities for those disabled individuals who are not considered potential candidates for return to remunerative employment. The provisions of the "Independent Living" title of the Rehabilitation Act of 1959 would make such opportunities available to a substantial number of our disabled citizens. Failure to provide such opportunities will guarantee their continued deterioration until they reach the totally dependent category. The neglect of disability even among persons without vocational potentials is far more costly than an aggressive program which restores the individual to the highest possible level of physical, emotional and social self-sufficiency.

Mr. Elliott. The subcommittee will now recess.

(Thereupon, at 5:20 p.m., the subcommittee was recessed, to reconvene subject to the call of the Chair.)

SPECIAL EDUCATION AND REHABILITATION

THURSDAY, DECEMBER 17, 1959

House of Representatives,
Subcommittee on Special Education
of the Committee on Education and Labor,
New Haven, Conn.

The Subcommittee on Special Education met, pursuant to notice, at 10 a.m., in the Federal courtroom, U.S. Post Office Building, New Haven, Conn., Hon. Carl Elliott, chairman of the subcommittee, presiding.

Present: Representatives Elliott (chairman of the subcommittee),

Daniels, Giaimo, Wainwright, and Lafore.

Mr. Elliott. The Subcommittee on Special Education is pleased to have this opportunity to meet in New Haven. This is one in a series of hearings that our subcommittee is conducting throughout the Nation.

The purpose of our hearing is to learn at firsthand what America's needs are in the field of education and rehabilitation and to learn

how we might best meet these needs.

We are also hearing testimony on specific bills which have been

referred to the subcommittee.

The members of our subcommittee who are present today are Mr. Daniels, of New Jersey; Mr. Giaimo, of Connecticut; Mr. Wainwright, of New York; and Mr. Lafore, of Pennsylvania.

At the outset I want to express to Congressman Giaimo our appreciation for inviting us to come to New Haven and for his very fine assistance in making this hearing possible. He and his staff have

been most helpful to the subcommittee in this regard.

Mr. Giaimo become a member of our subcommittee last year upon his election to Congress, and he has in this year proven himself to be able and energetic and effective and I personally count it a great privilege to serve with him in the Congress.

At this point I want to recognize Mr. Giaimo to present the mayor

of his home city, New Haven.

Mr. Giaimo.

Mr. Giarmo. Mr. Chairman, members of the subcommittee, it gives me a great pleasure to welcome you to our fair city of New Haven. We hope your stay here will be an enjoyable one and also a fruitful one. It is a real pleasure for me this morning to introduce to you the first witness who will appear before the subcommittee, the mayor of the city of New Haven.

Mayor Lee is an outstanding administrator. He has done a magnificent job in carrying out the affairs and the problems which face this city of ours. He is a young man. His energy and ability are re-

nowned not only in the city of New Haven, not only in the State of Connecticut, but undoubtedly throughout many parts of our Nation.

He is a man who needs no further introduction from me or anyone else. I am proud to be able to present him to you this morning.

Mayor Lee.

Mr. Elliott. Mayor Lee, you may proceed.

STATEMENT OF HON. RICHARD C. LEE, MAYOR, CITY OF NEW HAVEN, CONN.

Mayor Lee. Mr. Chairman and members of the committee, I am very grateful for the opportunity to come here this morning and especially to my neighbor and my representative, Bob Giaimo, for his very kind words.

I would like, first of all, to welcome all of you to the city and to say how glad we are that you are able to be among us for several days and

to hope also that your visit will be fruitful and productive.

We are rebuilding our city, as you know. We are attempting, in rebuilding it, to meet the challenge of the 21st century. In so doing we have to sort of dramatize the complex problems of human values

which face our people.

I am delighted, as a citizen, and as a public official, to see that Congress is taking such an active interest and active role, as well, in the total problem of special education and rehabilitation. I am sure you recognize that the city officials particularly see these kinds of problems at their most obvious level, which is the municipality.

We know that a great many of the people on our welfare roles, for example, are there because they lack simple training or work facilities which would open the doors of opportunity to them and help them to

become productive citizens.

Now, there are many who can speak with far more authority than I on some phases of the omnibus bills, such as opportunities for gifted children which are being denied them now in some measure—the blind

and the mentally handicapped.

I do not intend to talk about these this morning because there are other people who will testify, but I would like to talk this morning about the bill which is House Resolution 3465, the independent-living bill, which is before you. It is of special interest to our people because it exemplifies the potential of the investigation which you are conducting now.

Among the bills there are many worthwhile provisions. There is one which would make Federal funds available to localities which have need for sheltered workshop and training facilities. If this section were adopted, it would expand the possibilities for fruitful cooperation among the three levels of Government, Federal, State, and local, and the voluntary welfare agencies as well.

New Haven, for example, has a rehabilitation center which is supported by the United Fund and Easter Seals, an Office of Vocational

Rehabilitation, and Goodwill Industries.

But the need for modernization and consolidation and expansion of these facilities is acute. To put it mildly, there are many handicapped people who are homebound and for whom there is no rehabilitation service whatsoever; and there are many, therefore, whose work poten-

tial and work capacity have never even been tested.

Now, New Haven's private and public welfare agencies are attempting to fill this gap to help the handicapped gain new tools and new confidence in their struggle to overcome the social and psychological detriments which multiply their feeling of loneliness, uselessness, and neglect.

The voluntary agencies in New Haven are looking into the future and currently are studying plans on a long-range basis for a central

building to house some 15 such community agencies.

Now, we of the city are working with them and we are studying the possibility that the building could well become a part of one of the several redevelopment projects which we have underway here in New Haven. A central building of this type could offer unified work and training facilities for the handicapped all under one roof in pleasant physical surroundings which would offer hope for individual productivity and creative activity.

The bill before you would provide funds to help pay for the rehabilitation wing of such a building as we are considering here in

the city.

By expressing the national will to halt the terrible waste of human resources which comes from neglecting the handicapped and by speeding construction of such projects as this rehabilitation wing, the Federal Government would encourage public and voluntary agencies to cooperate for greater efficiency and accomplishment.

This type of frontal assault, I believe, is needed desperately at a time when statistics of rising welfare loads and declining city and

State resources are prominent in each day's news.

Congressional leadership and action will be effective reminders to the American people that the handicapped can and should be helped to achieve some degree of independence—that everything possible should be done to help them acquire special skills, which will enable them to take their place with self-respect and give them a fair chance to prove their worth side by side with the ordinary and useful members of our society.

I am delighted again that you have chosen to visit New Haven as you seek practical methods for treating such vital human problems as these. I hope that the meetings of the New England Regional Workshop, sponsored here in New Haven, were of help to you in your

study.

Thank you very much.

Mr. Elliott. Thank you, very much, Mayor Lee.

At this time the subcommittee will suspend a moment while the photographers take the mayor's picture.

(A short recess was taken.)

Mr. Elliott. Thank you very much.

The committee will resume its sitting.

May I say to you, Mayor Lee, that we deeply appreciate your welcome and the information that you have brought us which will be very helpful.

Mayor Lee. Thank you very much, Mr. Elliott.

Mr. Elliott. The Subcommittee on Special Education is indeed honored today to have with us a very distinguished and outstanding

Member of Congress from the Second District of Rhode Island, the Honorable John Fogarty. For many years now the programs sponsored by our Federal Government in the fields of public health and rehabilitation and special education have all borne John Fogarty's imprint. His knowledge, his sympathetic understanding, and his effective work in all these fields have earned for him the esteem and the admiration of all of us.

Just recently Congressman Fogarty received the Albert Lasker Award. This award was presented with a citation for his outstanding service in the field of public health. The award was in the amount of \$5,000 and it is no surprise to me that Congressman Fogarty gave this \$5,000 to the parents council of his home State of Rhode Island, to be used in an adult education program on mental retardation.

Congressman Fogarty is the author of two bills now being considered by this subcommittee, H.R. 1119, the independent living bill, House Joint Resolution No. 488, the speech and hearing bill.

Mr. Fogarty, you have honored us greatly with your presence here today. We are happy that you have come. We welcome you to bring the words of wisdom which you always do to us again here in this subcommittee hearing in New Haven.

You may proceed.

STATEMENT OF HON. JOHN E. FOGARTY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF RHODE ISLAND

Mr. Fogarty. Thank you very much, Mr. Chairman, and members of the committee.

First, may I commend you and your committee for taking time out during a recess of Congress, to get around and find out the thinking at the local level on the problems people have in the fields of rehabilitation and education.

I would also like to commend the committee for their attendance here this morning because, as you know, when congressional committees are traveling in the field the attendance is usually not so good.

But here we have all but one of the full subcommittee and I think that is a real significant way of showing how sincerely interested you

are in this kind of legislation.

I do not have to tell your colleagues and I am sure I do not have to tell the people assembled here this morning, of the leadership that you, Mr. Elliott, have provided in all of these fields of health, education, and labor.

You certainly have made a wonderful record for yourself and I'm happy to be able to make the same statement about all the members of

the subcommittee.

I would like to make special reference to the member in whose city we are meeting, Mr. Giaimo. I first met him almost a year ago; it was last January, in his first term as Congressman from this particular section.

I am convinced that the main reason you are meeting here in New Haven is because Congressman Giaimo happens to be a member of your committee. To my knowledge he has been one of the hardest working members of the committee and has been doing a wonderful job in Congress.

Now, I just want to say briefly that I am here to say just a few words as to what these bills are and how I became interested in this kind of legislation.

As the chairman has already said, I have been serving on the Appropriations Subcommittee that appropriates the funds for the Department of Health, Education, and Welfare for the past 13 years.

In this capacity I have had the opportunity for many years of asking questions of the Office of Vocational Rehabilitation, the Office of Education, our Public Health Service, and all of our national

officials who have some responsibility in those fields.

It was a doctor down your way, Mr. Elliott, down in Nashville, Tenn., who first brought to my attention some 3 years ago the great and crying need existing for trained teachers in the speech defect and hard of hearing field. He was a Dr. Wesley W. Wilkerson, Jr., who has a speech and hearing center in Nashville, Tenn., and he impressed me as being one of the most dedicated men I have found in

the entire country.

I was amazed when he told me, at that time 3 years ago, that we had in the neighborhood of some 8 million people in our country suffering from some form of speech defect, or who were hard of hearing in one way or another, that between a million and a half and two million thildren of school age had some of these defects; that about 30,000 children were born every year with a speech defect or some problem of hearing; and that the tragic thing was that we were graduating only 150 trained teachers a year when we should have been graduating at least 500 teachers a year just to keep current with the problem.

When these facts were brought to our attention we tried within the limit of our legislative responsibilities on the Appropriations Committee to add additional funds for research into those areas of speech defects and hard of hearing. But when it came to providing funds for educating or training teachers, it was found that we needed additional legislation, and that is why you, Mr. Chairman, and I and several others have introduced the bills that we are discussing today; bills that will provide additional teachers to take care of these children.

With your help, you will remember, just 2 years ago we were able to pass a similar bill appropriating a million dollars a year for 10 years to train teachers for the mentally retarded children of our country. That is now in its second year of operation and it is one of the most effective bills in the health area that we have been able to get through the Congress. I think, if I am correct, that it went through by a unanimous vote.

It was a bipartisan measure supported by everyone and I do not

think there was a single vote against it.

I hope that we will be able to do the same thing as far as this particu-

lar bill we are discussing today is concerned.

Now I would like to make a few comments about my other bill before the committee, the Rehabilitation Act of 1959. I have listened for some 12 or 13 years to Mary E. Switzer, who is doing such a wonderful job as Director of the Office of Vocational Rehabilitation, telling us from time to time that there were many gaps in our present vocational rehabilitation bill. As a result of listening to some of the things she had to say and to some of the representatives of the voluntary agencies throughout the country when they came before our Appropriations Committee to testify, it became obvious that something had to be done to fill in the gaps in the present act. It was for this reason that we have introduced the bill now under consideration which is called the Rehabilitation Act of 1959.

Now, I am not going to take time to spell out all the details of my bill. You are all thoroughly familiar with it, I'm sure. But I would like to read you one page of my prepared manuscript and then, with your permission, I would like to file the manuscript after which I will be happy to answer any questions there are.

Mr. Elliott. Without objection, the statement of the gentleman will be made a part of the record immediately following his oral pres-

entation.

Mr. Fogarty. In my opinion, the most important phase of the Rehabilitation Act of 1959, it will have to be changed to 1960 now, is the independent living portion of it. We all know that disability and disease are among the major causes of dependency.

The economic loss resulting from these major causes are again of the greatest magnitude to our economy. With prolonged disability, family earnings are wiped out and families are often broken up. Pub-

lic assistance and institutional costs are increased.

Essential labor skills are lost to industry and purchasing power and tax revenues evaporate. In human terms the cost is even greater in the loss of pride, dignity, and self-respect.

There are hundreds of thousands of disabled people in the Nation who can become self-reliant through rehabilitation, but who cannot now be served under the existing vocational rehabilitation program because they have no immediate employment prospects.

We need to enlarge the scope of the present program in order to make it possible for these people to receive rehabilitation services to prevent prolonged disability and to enable them to achieve independ-

ence at the earliest practical date.

As indicated, dependency is costly in dollars and human values. Independence, on the other hand, means conservation of dollars and self-respect. Every disabled person who is assisted in achieving independence, whether it be independence in meeting the normal needs of daily living only, or in holding and working at a job as well, contributes to society's economic and social well-being.

Whenever we are called upon to appropriate funds for the present Vocational Rehabilitation Act in their grant to State programs we are told that the most conservative figure that the agency has ever been able to gather is that for every Federal dollar that we have appropriated the Federal Treasury has been reimbursed at least on

a 10 to 1 basis.

Most of the voluntary groups that have made some study of this particular program seem to think that it is a 15 to 1 return rather

than a 10 to 1 return.

As you know, we have never had any problems getting the proper appropriations through Congress because of the wonderful work that has been carried on under the present Vocational Rehabilitation Act. I know that you can see, Mr. Chairman, because of your interest and the interest of the other members of your committee, if we can expand the act as we are proposing now, what a wonderful thing it would be for every person, whether employable or not, who is physically handi-

capped to some extent.

It would be an economic gain for our city, our State, and our Nation. I do not think you can count in dollars the moral gain that a person receives when he has received some rehabilitation. Whether it is to just take care of himself so that he does not have to be in an institution or does not have to pay for attendant care, or gives the disabled person a chance to take a job for the first time in his life, I think that effective rehabilitation must be one of the most rewarding experiences that a person like that can have.

After listening to some of these programs for 12 or 13 years now, I think that these people are being neglected on a local and State level and that unless the Federal Government takes the lead and stimulates local communities and the States with programs like this, our disabled people are not going to receive the assistance that they should have.

(The formal statement of Mr. Fogarty follows:)

FORMAL STATEMENT OF HON. JOHN E. FOGARTY, U.S. REPRESENTATIVE OF THE SECOND CONGRESSIONAL DISTRICT OF RHODE ISLAND, IN SUPPORT OF HIS LEGISLATION TO ASSIST PERSONS AFFLICTED BY SPEECH AND HEARING DISORDERS AND TO RESTORE THE PHYSICALLY AND MENTALLY HANDICAPPED TO "INDEPENDENT LIVING"

Mr. Chairman, it is indeed a pleasure for me to have the opportunity to appear as the first witness at these hearings and to discuss the proposed legislation reflected in House Joint Resolution 316, and the subsequent proposal, House

Joint Resolution 488, and also H.R. 1119.

The joint resolution, which I have cosponsored with our good friend, Senator Lister Hill, as you know, is intended to make available to children handicapped by deafness the specially trained teachers of the deaf needed to develop their abilities, and to individuals suffering speech and hearing impairments those specially trained speech pathologists and audiologists needed to help them overcome their handicaps.

The bill, H.R. 1119, which I also cosponsored with Senator Hill, is designed to fill gaps in existing rehabilitation services which result in the denial of such services to many physically and mentally handicapped individuals who could

benefit from them.

I would like to start off by discussing briefly the urgent need for the speech and

hearing bill.

As we all know, there are in the population a large number of people with speech and hearing handicaps—both children and adults—who need special help if they are to function normally in our society. Special services in our country are provided mainly by health, rehabilitation, welfare, and educational agencies, and much could be said about the importance of each of these services. Most essential, of course, is early case finding through health and welfare agencies as well as through the schools, and of especial importance is care of adult citizens including the aged who suffer from impaired hearing. It is necessary for our public agencies at the local, State, and Federal level, in cooperation with private agencies, to provide a balanced program of medical care, education, rehabilitation, and welfare services so that these citizens of all ages who are handicapped by speech or hearing defects can enjoy as full a life as possible and make a maximum contribution to society. On the whole, I would say, services to these citizens are far from adequate.

In discussing this problem and the needs of these individuals illustrations will be drawn mainly from the problems and needs of school-age children and youth since it is obvious that unless our schools offer the best possible corrective help and suitable opportunity for education to these young citizens, later efforts directed toward rehabilitation, employment, and social adjustment will not be

fully effective.

Children and youth with speech and hearing disorders comprise the largest single group of handicapped children. It is conservatively estimated that between 1½ and 2 million school-age children have speech or hearing impairments which are severe enough to interfere with their emotional, social, and

intellectual development. The majority of these have speech defects and about one-fourth of them have limited but usable hearing, and are often referred to as "hard of hearing." A relatively small number, perhaps 40,000, are so

severely handicapped as to be classified as profoundly deaf.

In a February 11, 1958, report from the Commissioner of Education, submitted in response to a request of the subcommittee of the Committee on Appropriations of the U.S. House of Representatives, it was indicated that about 90 percent of the speech correction, lip-reading instruction, and auditory training for school-age children is carried on in the elementary and secondary schools. However, this type of service needs to be multiplied. There is a wide gap between the number of children and youth needing this service and the number actually receiving it.

The report stated that not more than one out of five of the school-age children requiring speech correction or special instruction because of hearing loss are receiving this. Only about 4,000 speech correctionists and teachers of children with impaired hearing are now in the Nation's schools and about 20,000 would

be required.

It was also indicated, that while school programs should be extended and research continued and intensified, the single greatest deterrent to progress is the lack of qualified personnel. Thus, it seems that the goal of serving all of the Nation's children could not be reached without additional well-trained per-The task of recruiting and preparing the needed number of speech correctionists and special teachers is so great that without Federal aid State and local school systems and colleges and universities face an all but insurmountable task in attempting to meet this enormous problem. Further, a gap exists in the Federal contribution to the development of personnel in this field. Federal aid is now available for the training of medical and clinical personnel but not for the training of educational personnel.

While the total number of deaf children and youth is small in comparison to the total school-age population, the needs of each deaf child are acute. The major problem which confronts the deaf child is that he cannot learn language in the usual imitative way. This has a tremendous influence on his ability to profit from educational opportunities. The school, therefore, must teach him in a systematic way to develop communication. It also must provide him with the usual school curriculum and the tools of learning. In addition to such educational opportunities, the deaf will need, as they mature, much help from rehabilitation and guidance services. Some deaf individuals may require aid throughout their lives. Given suitable education and guidance, most of the deaf

children and youth can develop into contributing well-adjusted members of society.

The task of preparing teachers for the deaf is highly technical and calls for extensive professional preparation. At present, schools face an increasingly critical shortage of qualified educators to work with these children. This is probably partly because teaching the deaf is one of the most difficult of all teaching tasks. It appears that unless more is done through such means as substantial scholarships, it will not be possible to recruit the necessary number of qualified and dedicated educators needed for this field. According to estimates not more than one-third of the number of teachers needed each year are being recruited and prepared. Furthermore, it appears that not enough promising persons are preparing for leadership positions. To illustrate, in 1953-54 not a single college reported awarding a doctoral degree in the education of the deaf.

Legislation directed toward solving the personnel problem in this field will be a step forward toward providing for those with impaired speech and hearing. House Joint Resolution 488 is recognizing the need for qualified personnel to aid the largest single group of handicapped individuals, namely those with speech and hearing disorders. It is also recognizing the critical shortage of well-qualified teachers of the deaf and is suggesting a Federal scholarship pro-

gram for classroom teachers in this field.

In the case of the deaf, the proposed legislation recognizes a serious human need even though it affects only a small segment of the population. The intent of this legislation is aimed at broadening the scope of Federal benefits to the less fortunate members of our society.

In the matter of the "independent living" bill, as we all know, disability and disease are among the major causes of dependency. The economic loss resulting from these major causes are a drain of the greatest magnitude on our economy.

With prolonged disability, family earnings are wiped out and families are often broken up; public assistance and institutional costs are increased; essential labor skills are lost to industry; and purchasing power and tax revenues evaporate. In human terms, the cost is even greater in the loss of pride, dignity, and self-respect.

There are hundreds of thousands of disabled people in the Nation who can again become self-reliant through rehabilitation, but who cannot now be served under the existing vocational rehabilitation program because they have no immediate employment prospects. We need to enlarge the scope of the present program in order to make it possible for these people to receive rehabilitation services to prevent prolonged disability and enable them to achieve independence at the earliest practical date. As indicated, dependency is costly in dollars and in human values; independence, on the other hand, means conservation of dollars and self-respect. Every disabled person who is assisted in achieving independence—whether it be independence in meeting the normal demands of daily living only, or in holding and working at a job as well—contributes to society's economic and social well-being.

H.R. 1119 would add three new titles to the present Vocational Rehabilitation Act (which would become title I under the bills). The new title II would establish a program of Federal grants to States to help them provide rehabilitation services to handicapped individuals who could not reasonably be expected to become able to engage in remunerative work as a result of such services but

who could be expected to achieve independent living.

The new titles III and IV would authorize, respectively, additional Federal grants for the establishment of rehabilitation facilities and workshops, and additional Federal grants for the provision of evaluation services to substantially handicapped individuals. The bill would make several other amendments to the existing act and would also increase the appropriation authorization for the President's Committee on Employment of the Physically Handicapped.

I should like to discuss the provisions of H.R. 1119 in the order indicated

above.

TITLE I, MODIFICATIONS TO PRESENT VOCATIONAL REHABILITATION PROGRAM

Title I of H.R. 1119 would, among other things, amend section 3 of the vocational Rehabilitation Act to provide for the reallotment of extension and improvement funds not taken up in full by any of the States. The fundamental purpose of section 3 is to provide Federal financial encouragement to the States to initiate planned activities to reach out and make better the vocational rehabilitation services to disabled persons without diverting any part of their basic support funds from their ongoing program. I feel that it is highly desirable to have this provision for reallotment so that all funds appropriated for extension and improvement purposes are utilized in the vocational rehabilitation program. Such reallotment is essential for the progressive expansion and growth of the program.

This title would also amend the Vocational Rehabilitation Act to provide that where States qualify for Federal grants for diagnostic and evaluation services under title IV of this bill, the vocational rehabilitation services provided under

title I shall not include diagnostic and evaluation services.

TITLE II. INDEPENDENT LIVING REHABILITATION SERVICES

Title II which would be added to the present law by H.R. 1119 would authorize separate appropriations of \$10 million the first year, \$20 million the second, and for subsequent years such sums as the Congress deems necessary to help State rehabilitation agencies with approved State plans to extend rehabilitation services to handicapped individuals who, as a result of such services, can achieve independent living. Independent living is described as "such ability of independent living as to dispense with, or largely dispense with, the need for an attendant, thereby reducing their burden upon others and contributing to their disnity and self-respect.

Annual appropriations would be distributed to the States in accordance with a formula similar to that of section 2 of the Vocational Rehabilitation Act, and matched by the States on a basis similar to that provided for Federal grants

under such section 2.

I believe the Vocational Rehabilitation Act should be amended to permit the provision of rehabilitation services for independent living purposes. I am of the firm conviction that many tangible economic, social, and humanitarian values

will accrue from such a program.

Never before have so many and such effective means existed for preventing, reducing, and overcoming the handicapping effects of disability. Extended disability means dependency and a continuing drain on families and the resources of a community. Rehabilitation has demonstrated overwhelmingly, that much of the handicapping effects of disability is needless. Not only do we have a great need today to provide rehabilitation services for independent living to the thousands upon thousands of our disabled people who require and who can benefit from these services, but with disability increasing in our growing and aging population we should now establish this program to meet an even greater future need. We should keep in mind, too, that many severely disabled people—including some of our older disabled people—who are brought to a state of independence in meeting the normal demands of daily living will be found to be capable of vocational rehabilitation and will become gainfully employed.

TITLE III. WORKSHOPS AND REHABILITATION FACILITIES

Title III, proposed to be added by H.R. 1119, would authorize appropriation of funds (\$10 million for the first year, \$12½ million for the second year, \$15 million for the third year, and for subsequent years such sums as the Congress may determine) with which the Secretary of the Department of Health, Education, and Welfare would make grants for the construction and alteration of buildings for nonprofit workshops and rehabilitation facilities, for initial equipment of such facilities, and for staffing them for a period not to exceed 2 years.

Such grants would be distributed among the States in aggregate amounts proportionate to their population, and the Federal share of the cost of any project could not exceed \$2 for each \$1 otherwise obtained. The definition of workshops and rehabilitation facilities is generally the same as that contained in the Vocational Rehabilitation Act except that the workship definition includes provision for employment of persons confined to their homes. The State rehabilitation agencies are required to approve project applications as feasible and necessary for vocational rehabilitation, and are to be granted Federal funds for the costs of this service. Responsibility for the establishment of standards and the approval of each project is assigned to the Secretary.

Currently, the total number of rehabilitation facilities and workshops is grossly inadequate to meet the needs of the handicapped. These facilities and workshops are indispensable tools to our modern rehabilitation processes. They provide the means for evaluating, treating, and training the severely disabled who

otherwise could not be effectively rehabilitated.

Some facilities and workshops should be large, some small, some should serve all disability groups, some should serve only selected groups. Regardless of the size of the facility or workshop, each plays an important role in the rehabilitation

area it serves.

The disabled people who need the services that rehabilitation facilities can so well provide are the people who are severely incapacitated by the neuromuscular diseases, such as multiple sclerosis and muscular dystrophy; they are the amputees who need proper fitting and training in the use of prostheses; they are the people so crippled by arthritis that they have lost the capacity to work or to look after their personal needs. They are the deaf, the hard of hearing, and people with speech impairments; they are the blind; they are victims of polio; they are the epileptics and the cerebral palsied. In fact, they are all severely disabled people who require a combination of services especially designed to help them regain or achieve maximum physical, vocational, and social capacity.

There are in the United States today about 400 workshops whose programs have rehabilitation content. These workshops fall far short in number in meeting present-day needs. Moreover, few of our communities are in a position to establish without financial assistance the additional workshops that are needed.

Modern rehabilitation workshops are required in large numbers for the rehabilitation of thousands of our people who are disabled in many ways. These workshops are especially needed by the mentally retarded and the mentally ill. In these workshops the mentally retarded can be taught fundamental work habits and job skills commensurate with their abilities so that they become independent working members of society. It is estimated that there are over one-half million mentally retarded adults of working age in our society who have never had an opportunity to work and who, therefore, are dependent upon their families, friends, institutions, or other public resources for their support. Most of these people need workshop services in order to work.

Individuals who have recovered from a mental illness, particularly those who have been institutionalized, often need workshop training and experience to recover lost skills, to build up work tolerance and above all to regain confidence in themselves so that they are secure in their work and social relationships.

Many older disabled workers with multiple disabilities need the services of workshops in order to return to work. Quite often the older disabled worker requires extensive reconditioning services before he is able to return to their customary jobs. They are, nonetheless, enabled by the dramatic advances in medicine to live on for many years. Within their limitations, they still have a lot to contribute if they can be given opportunities for productive work on a part-time basis, or on a full-time basis in sheltered workshops, or under other special conditions. There are in our population today about 50 million people who are 45 years of age and over. As this number increases the problem of the older disabled worker will become even more acute than it is today. Many hundred additional workshops are needed to meet present needs, to say nothing of future needs.

TITLE IV. REHABILITATION EVALUATION SERVICES

Title IV, which H.R. 1119 would add to existing law, would authorize the Federal Government to pay two-thirds of the cost, including administration, which the States incur in evaluating the nature and extent of the disabilities and the rehabilitation potential of substantially handicapped individuals applying for vocational rehabilitation services under the present Vocational Rehabilitation Act or for independent living services under the proposed new title II.

The key to success in the rehabilitation of severely disabled people is the adequacy of the diagnostic and evaluation services that are provided.

The diagnostic process for the paraplegic, the quadraplegic, the epileptic, the hemiplegic, the amputee, the emotionally ill, and others who are under severe complicated physical and mental handicaps must be in greater depth and breadth

than the diagnostic and evaluation procedure for the less severely disabled.

For example: A paraplegic must have the following tests, examinations and evaluations, upon which to base a prognosis for rehabilitation: (a) a complete general physical examination; (b) a complete neurological examination to determine the degree of paralysis and the level at which paralysis exists; (c) a complete urological examination to determine kidney and bladder functions; (d) complete psychological examinations and preferably a psychiatric examination, because the emotional trauma accompanying this severely disabling condition is of a most serious nature; (e) a complete vocational exploration, because it is not likely that the paraplegic will return to the kind of work he had before; (f) a complete social evaluation. With a condition as severe as this, family and social relationships change. Evaluating the strengths and weaknesses in the disabled person's family and social relationships is essential in determining his rehabilitation prospects; (g) examination by a specialist in physical medicine and rehabilitation, who, among other things, coordinates his findings and all of the other medical findings described above and who sets up the physical regime for the patient. This would include physical and occupational therapy, prevocational exploration, etc.

All of these tests, examinations and evaluations should be done by all these experts, working in concert and as a team. These specialists can best work together as a team in specialized facilities, principally in the comprehensive rehabilitation facility, which offers the best means and resources for bringing them together.

An examination of this kind is in marked contrast to the diagnostic and evaluation services required by less severely disabled persons. For example, a person with a mild hemiplegia, or an arthritic, might adequately be evaluated by the family physician, the physical medicine specialist, the vocational counselor, utilizing certain psychological tests and the social worker.

There is urgent need for special provision in Federal legislation for comprehensive diagnostic evaluation services for the severely disabled which title IV

of my bill would provide. This will accomplish the following ends:

(a) It will give greater assurance that more of the people who need such evaluations will receive them.

(b) It will provide States the incentive, stimulation and money they need to provide more of the severely disabled with these comprehensive examinations.

(c) Although expensive at the beginning, in the long run it will result in economy—there will be more successful rehabilitations of the severely disabled and fewer failures.

(d) It will result in sounder expenditure of both Federal and State rehabilitation funds for training and other restorative services.

(e) It will result in more economical use of the vocational rehabilitation counselor's time and the time of other officials of State agencies—hence, it will result in more efficient and economical administration.

(f) It will mean greater use of rehabilitation facilities.

Research and training

Section 5 of my bill would amend section 4(a)(1) of the present Vocational Rehabilitation Act to eliminate the requirement that sponsors of projects for research, demonstration, training, traineeships, and the establishment of special facilities and services, pay a part of the cost of such projects. I believe that the "part of the cost" condition in existing law is unnecessary and burdensome upon both the sponsors of projects and upon the administering agency. In other programs that do not have this condition, sponsors contribute to the cost of their research and training projects. Moreover, elimination of this requirement would bring the conditions of the vocational rehabilitation research and training program in line with the conditions of other research and training programs, both within and without the Department.

President's Committee on the Employment of the Physically Handicapped

Section 6 of H.R. 1119 would increase the appropriation authorization for the President's Committee on the Employment of the Physically Handicapped from \$225,000 to \$300,000. This committee, an independent agency of the executive branch of the Government, seeks constantly to secure greater job opportunities for our physically handicapped men and women. This increase in the appropriation authorization is necessary in order that the committee may continue its vital and excellent work.

In conclusion, I should like to reiterate my deep conviction of the urgent need for a rehabilitation program for independent living, for a facility and workshop program and for a diagnostic service program such as my bill would provide. I believe further that the programs encompassed by H.R. 1119 will enhance America's humanitarian and economic march of progress.

Mr. Elliott. Thank you, Congressman Fogarty.

You do our subcommittee honor by bringing us the great wisdom

that you have acquired in this field.

I personally felt very good when I learned you received the Albert Lasker Award this last fall and that was underscored, too, by the fact that a native of my home State, Senator Lister Hill, was chosen for that award, as well.

Mr. Fogarty, to put it very briefly, is the reason behind many of the fine appropriations in recent years for work in the fields about which he has testified. He is recognized all over the country as the outstanding expert not only in the field of legislation, but in the field of appropriations as well. We are happy to have the benefit of his testimony.

Thank you very much, Mr. Fogarty.

I have been told that the judge does not want any smoking in this courtroom and it seems that it falls to my lot to bring the bad tidings. I have to tell the people that they cannot smoke and I have to tell my friends of the press that they cannot take pictures and so on, but that is the way it goes.

Our next witness is Hon. Emilio Q. Daddario, a Member of Congress from the First District of Connecticut. Mr. Daddario has a prepared statement. You may proceed, Mr. Daddario, in any manner you see fit. You may testify from your statement, or you may summarize it.

If you care to summarize it, then the statement in full will be made a part of the record when you have completed your oral presentation.

Let me say on behalf of the subcommittee that we are happy to be in your State and we are happy to have the benefit and privilege of your testimony.

It is a pleasure to serve in the Congress of the United States with Mr. Daddario and we appreciate his interest in the subjects that this

committee is devoting its time to now. You may proceed, Mr. Daddario.

STATEMENT OF HON. EMILIO Q. DADDARIO, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CONNECTICUT

Mr. Daddario. Mr. Chairman, I welcome you and your committee to the State. We here in the State of Connecticut are especially interested in the matters with which your Subcommittee on Special Ednication deals.

Mr. Chairman and members of the subcommittee, I am appearing here today to support proposed legislation you are considering to ease the critical shortage of trained teachers of the deaf in the United States.

I represent Hartford County, a district which is proud to be the home of the first permanent institution of its kind for the schooling of the deaf to have been established in the United States. That is the American School for the Deaf in West Hartford, which opened its doors in 1817 at the initiative of the Reverend Thomas H. Gallaudet.

The special educational problems in this area have long drawn the

sympathetic and serious attention of people in my area.

The shortage of trained teachers of the deaf is not a new problem. To to extent, it parallels the growing need for teachers to meet the general educational crisis anticipated in this country.

The preamble to House Joint Resolution 494, sponsored by Mr.

Elliott, states the problems succinctly and well.

There are, however, a number of facts which should be considered in your deliberation. I should like to highlight some of these, and

then offer the rest of the statement for the record.

The toll of neglected physical disability is high in any society. In an age when we must make full use of our resources and talents to improve our standards of living and guarantee our survival, it would be a disaster to let ability wither, or to permit, through inaction, indifference to shape and mar the lives of many afflicted by partial or total deafness through no fault of their own.

We Americans believe devoutly in the positive worth of the individual. We must, if we are to meet our own standards, do everything to see that opportunity is extended to every individual on equal

grounds.

By the nature of the problem we face, that means special education to correct physical disability. There are just as many gifted children among the hard of hearing as there are among those with normal hearing.

We must make every effort to let them be identified and let them

make their contributions to our future.

As a member of the Science and Astronautics Committee, I am

especially conscious of this problem in two of its aspects:

I know how seriously we need to find young scientists and see that they get the training necessary to participate in our technological advances.

I know, too, how important research is to the cure and prevention

of more serious national disability.

Neither of these aims will be achieved through inaction. For every Edison who surmounts difficulties to enrich this Nation, how many talents have been lost through inadequate care and attention in the schools?

This is not, of course, a local problem. It is a national problem. We know that children with hearing problems fail school four times as often as children with normal hearing. They repeat grades at a cost to taxpayers of some \$20 million a year.

Across the country, it has been estimated that 3 to 5 million school-

children need help in the areas of speech or hearing.

At present, scarcely more than one in five school-age children who

need the attention of a speech correctionist are receiving it.

Not more than 4,000 speech correctionists and hearing specialists are estimated to be working in the Nation's schools, and they have varying qualifications.

Your proposed legislation notes that it is believed that some 20,000 such specialists would be needed to staff a fully developed remedial

program.

Throughout the country varying efforts are made to locate and correct speech and hearing problems. In Connecticut State law requires a physical examination for each schoolchild every 3 years which should include a hearing test.

Larger communities conduct their own hearing examinations. The State department of health supplements this schedule with a traveling team of two audiometrists who visit schools and medical and hearing clinics, measuring the hearing of pupils between ages of 3 to 21.

The highest incidence of loss of hearing appears to be found in the

age brackets from infancy to 9 years.

The State will test at the request of communities, or on special

directions of certain State authorities."

A third type of program is aimed at checking nursery school children in the Hartford area. In 1958 the State department of health team referred some 163 Connecticut children for examination on the basis of a suspected hearing loss. Twenty-one of these were preschoolers preparing to enter kindergarten and 142 were already in the schools.

By medical and educational methods, these children once identified can be assisted to achieve a greater benefit in their formative years

than they would otherwise.

Many of the people with a slight loss of hearing often grow up without realizing their handicap. The most serious effect of this disorder is that ordinary communications between persons are interfered with; pupils do not receive the full impact of instruction and are often suspected of being backward for the lack of it.

The individual's sensitivity is likely to be affected, with an effect on the personality in these youthful years. The full warmth of family life is lost, and the child does not attain the satisfaction he might. We in Connecticut believe that a program such as ours is most necessary. It is, however, unfortunate, that there is no uniform program to detect hearing loss in the entire country, nor any organized program to assure referral of children.

I know of many who feel that the rescue of one child from a misinterpretation of his hearing difficulties is well worth the effort spent.

Consider, however, the problem of the children who are determined by medical means to need special care and training. Here we run up against the critical shortage of trained teachers in the special schools today. Throughout the United States and Canada, qualified personnel are scarce. Positions are open in public and private residential schools, day schools, and day classes as well as in institutional speech and hearing classes.

Some 25 teacher training centers meet the standards of the profession for preparation of additional teachers, but are not pressed by

applicants.

A teacher of the deaf needs many special skills. In addition to regular teacher training, for classroom work, he or she must have special abilities to work with hard of hearing children. He or she must teach the child the basic skills of understanding the spoken language, speech reading, how to use speech and language to make yourself clear. He or she must know the problems of communication that the child is experiencing.

He must be able to explain the individual's difficulties to an often bewildered child or parents, teachers, principal, nurses, guidance counselors, and other school personnel, and he must work hand in hand with other school personnel in shaping programs and curricula.

He must have a good working relationship with medical or scientific personnel, such as the therapists, psychologists, and psychiatrists.

He must be able to administer the necessary hearing tests and to

interpret for the public the total impact of such a program.

The teacher recruitment problem has been under discussion for many years. The hearing which this subcommittee is holding is performing a valuable service, I feel, in bringing this discussion to the attention of the public, and in spotlighting the need.

The latest figures I have seen show that about 150 persons are now in training to become teachers of the deaf by next fall. The estimates show that at least 500 qualified replacements will be needed in existing

schools at that time.

The gap must be made up, as it has in the past, with untrained teachers, with a consequent loss in effectiveness in the education of this group. The need is self-evident.

I wholeheartedly urge that this subcommittee recommend legislation

to meet it.

Mr. Elliott. Thank you very much, Congressman Daddario, for a very fine and a very helpful statement. We approxiate the trouble

you have been to to bring it to us.

Mr. Daddario. It is a pleasure to be here, as I said before, and of course, to have the opportunity to meet my colleague, Mr. Giaimo. This is a small State, but he and I have not crossed paths since Congress adjourned in September.

Mr. Elliott. What is your town, Mr. Daddario?

Mr. Daddario. Hartford, Conn.

Mr. Elliott. Thank you very much.

Mr. Daddario we will be happy to have you sit with our subcommittee at any time during the day that you may find time to do so.

Mr. Daddario. I appreciate that, Mr. Chairman.

Mr. Elliott. Our next witness today is Miss Gertrude Norcross, executive secretary of the Connecticut Society for Crippled Children and Adults, of Hartford, Conn.

Now the committee will suspend a moment while our friends from

the press remove their cameras.

(A short recess was taken.)

Mr. Elliott. The committee will resume. Our next witness is Miss Gertrude Norcross.

Miss Norcross, we are happy to have you.

Let me say now that we have for today 28 other witnesses. It is

necessary that I confine each witness to 10 minutes.

With that in mind, may I say to you, Miss Norcross, that you may proceed to read your statement if you wish, or you may summarize it and let it be made a part of the record after your summary has been completed, but in order to hear 28 witnesses, which is 280 minutes, even at that rate we will have to move along.

So you may proceed, Miss Norcross, with that understanding.

STATEMENT OF MISS GERTRUDE NORCROSS, EXECUTIVE SECRETARY, CONNECTICUT SOCIETY FOR CRIPPLED CHILDREN AND ADULTS, HARTFORD, CONN.

Miss Norcross. Thank you very much, Mr. Elliott.

I don't think I will need more than 5 minutes to present what I have

to sav at this time.

I am here today representing the Connecticut Society for Crippled Children and Adults. This nongovernmental agency, over a 24-year period, has provided a great deal of the leadership in this State to improve the services available and needed for the crippled people of this area.

It is, therefore, a privilege and an honor that we have been given this opportunity to present to you briefly a few suggestions as to how the Federal Government might assist, to a greater extent, the work which the governmental and private agencies in Connecticut are now

carrying on to the best of our ability.

The Society for Crippled Children and Adults is a part of the Easter seal movement within the United States which receives leadership and help through our affiliation with the National Society for Crippled Children and Adults. This society has already indicated to you its interest in H.R. 3465, H.R. 1119, and S. 772, the bills which I would like to discuss briefly as they affect our various programs in Connecticut.

The Easter Seal Society in Connecticut since its incorporation in 1935 has had as one of its aims working with the governmental agencies to provide those services not currently available through tax supported programs or those which it has been mutually agreed should be

developed through voluntary funds.

As a result, we now have in this State a network of five rehabilitation and/or treatment centers including four sheltered workshops which have been started with Easter seals funds. There are other local programs which Easter seals have helped to start as a cooperative effort

with other agencies.

We also have a homebound craft service reaching a limited number of patients, a recreational program for the severely disabled, including two day camps and a resident camp, and a rather extensive program of social services.

You might wonder if one agency in a relatively small State has these facilities why we are interested in expanding them, or what our plans

might be.

As a matter of fact this society alone served over twenty-four hundred serious involved patients last year and we feel that we are just scratching the surface.

Many of these people were sent to our facilities by the governmental agencies for evaluation, all types of therapy, preemployment and em-

ployment assistance.

Many others, however, come to us who could not qualify for public help because they were not eligible for the present vocational rehabili-

tation service.

These include handicapped homemakers to a great extent, those with questionable diagnosis and no vacational objective, and the very large group of seriously disabled who might be helped in a sheltered workshop or at home to become more independent and able to care for their own needs more effectively.

We would hope that your definition of the handicapped could include these groups as well as those currently in institutions or needing

an attendant.

We, as a private society composed largely of volunteers who have seen the need and have organized these facilities and hired the staff to carry out the objectives of the society, are not in a financial position to carry the complete burden of this seriously disabled group.

We feel our experience over the years has demonstrated the need and we feel reasonably competent to carry on the program which we now

have and which we contemplate.

From the standpoint of financing the patients, the governmental agencies have been lacking in funds for case services to help us and lacking in staff to make the necessary decisions to find the patients and make the referrals to our facilities.

At the same time, this shaky financial picture has prevented our own trustees from taking the necessary steps to provide the services which we know are lacking—particularly in eastern Connecticut.

We would hope that a careful review would be made of the needs to expand existing facilities before undertaking the establishment of

new ones.

As an organization interested in all ages and all types of disabled people, we hope that you will each personally review the substantiating data which will be presented to you in these hearings. We urge the Federal Government to help our division of vocational rehabilitation receive the funds which are needed, both on a case service and administrative level, to allow them to assist the handicapped of Connecticut the way the help is needed.

Thank you.

Mr. Elliott. Thank you very much. Are there any questions of Miss Norcross.

Thank you very much, Miss Norcross, for your very helpful statement.

Our next witness is Dr. William J. Sanders, the commissioner of

education, State board of education, Hartford, Conn.

Dr. Sanders, we are very happy to have you. You may proceed in any manner you see fit.

Do you have a written statement, Dr. Sanders?

STATEMENT OF WILLIAM J. SANDERS, COMMISSIONER OF EDUCA-TION, STATE BOARD OF EDUCATION, HARTFORD, CONN.

Mr. Sanders. Yes; I have, Mr. Chairman. I shall be happy to submit this.

Mr. Elliott. If we could have a copy for the members as we go

along, it will be helpful.

Mr. Sanders. I appreciate very much the opportunity of being able to make this presentation to the committee and certainly am very happy that Congressman Giaimo was able to bring you to Connecticut for this hearing.

First, I would like to make the statement with respect to H.R. 3465,

the independent living bill.

The Connecticut State Department of Education favors H.R. 3465, a bill which will provide for the extension of rehabilitation services to severely handicapped persons not heretofore eligible and assist in the establishment of public and private nonprofit workshops and

rehabilitation facilities.

Under the existing act, the State department of education, through which the office of vocational rehabilitation works, has many more referrals for service than can be handled, due to the lack of funds available. This is in spite of the fact that Federal contributions to this program have increased from the amount of \$276,169 in 1955 to \$327,450 in 1959, and that the State's contribution to the program has increased from \$150,191 in 1955 to \$250,096 in 1959.

During the current year 5,000 persons were seen by our counseling staff, but our estimate is that there are 26,000 persons in the State

who need rehabilitation service.

We believe it is of the utmost importance that rehabilitation not only result in employment but that it brings the handicapped who will not be employed to care for themselves and for their homes.

The sheltered workshops and rehabilitation centers in the State and several developed recently, are not large enough or sufficient in number to meet the growing need for them. Federal grants-in-aid should be available to strengthen existing facilities and make the establishment of additional ones possible.

I would like to say also that we favor the bill as it is written without any changes unless, of course, the appropriations should

be increased.

With respect to Joint Resolutions 316 and 494, which I have also been invited to comment on, I should like to make some remarks about the situation in Connecticut.

The statement which follows reflects the status and needs of public school education in Connecticut and in the areas of speech and hear-

ing education. The Connecticut State Department of Education favors House Joint Resolutions 316 and 494.

STATUS AND NEEDS OF 1959-60 SPEECH AND HEARING SERVICE

The most recent White House Conference on Education estimated that 5 percent of the school population have speech and/or hearing handicaps. This report on status and needs in Connecticut is based on this rate of incidence.

1. In Connecticut public schools, 22,885 children have speech and

hearing problems.

2. Thirty-five percent, or approximately 8,000 children, are now receiving special speech and hearing instruction in Connecticut public schools.

3. Sixty-five percent, or 14,875 additional children, could benefit

were such services available.

4. Eighty speech teachers now provide services for the 8,000 children.

5. One hundred and fifty additional speech teachers are needed now

to provide services for the 14,875 children.

6. Ten additional speech teachers are needed now to meet speech needs of the mentally retarded children.

7. A total, then, of 160 additional speech teachers are needed now

in Connecticut public schools.

These data do not include the 3,965 children who could benefit from speech and hearing services were such services available in parochial schools. An additional 40 teachers would be needed to meet this need.

NEEDS OF 1965-66 SPEECH AND HEARING SERVICES

1. Five thousand seven hundred and sixty-seven additional children—over estimate for 1959-60—will need speech and hearing services in 1965.

2. Fifty-eight additional speech teachers will be needed to work

with these 5,767 children in 1965.

3. Twenty additional speech teachers will be needed to work with mentally retarded children.

4. Thus, 318 speech teachers will be needed in parochial schools

in 1965.

5. Seventy additional speech teachers will be needed in parochial schools in 1965.

6. A total, therefore, of 388 speech teachers will be needed in the public and parochial schools in 1965, or 308 more than are employed in 1959–60.

The State department of education now operates Mystic Oral School for the Deaf, Mystic, Conn.:

1. A 64-percent increase in enrollment took place during the past 6 years; present enrollment 139.

2. Twenty-seven children are on the waiting list because of lack of teachers.

3. Nine classroom teachers are needed now and cannot be found. 4. One audiologist is needed for hearing evaluation of pupils upon admisison and for systematic retesting and for advice in fitting of hearing aids.

STATUS OF HEARING TESTING IN CONNECTICUT PUBLIC SCHOOLS

In approximately 60 percent of the Connecticut public schools, the only hearing test given is the pure tone screening test. Although school nurses and others doing hearing testing realize the need for a threshold hearing test to be given before referring a child to an otologist, in many of the local school systems there is no one qualified to give this test.

If a reliable threshold test can be given in all local schools periodically, the child with a hearing impairment can be identified early and

referred for further examination.

Recommendations: From the data that has been presented it is apparent that the most critical need in this area is to increase as quickly as possible the supply of speech and hearing teachers.

We feel it is necessary that there be Federal funds available to provide financial assistance through scholarships for needy students who are pursuing training in this area and to assist colleges and universities to expand or initiate training programs for speech and

hearing teachers.

At this time in Connecticut there is such a program at the Connecticut Southern State College and at the University of Connecticut, but there does need to be encouragement for people to come into

this program

I have an additional statement which I will just mention and file with you, if I may. This is with respect to the needs in the field of the emotionally disturbed and mentally handicapped. I should like to compliment Congressman Fogarty and this committee and the Congress on the excellent bill relative to mental retardation and to assure you that we are taking advantage of this bill in this State through preparing people for teaching the mentally retarded.

I do have some material on the socially and emotionally malad-

justed. It is hoped we can get help in this direction also.

The Connecticut Assembly last year passed a bill recognizing the need for assistance to such people. Only a slight appropriation was made, but at least the bill is on the books. We do need Federal support in order to encourage improvement in this very important area, but I will not speak any further on this. I will just hand this material to the committee.

Mr. Elliott. Without objection, the additional statement of Dr.

Sanders will be made a part of the record at this point.

Thank you very much, Dr. Sanders. We appreciate your kindness. At this point I would like to read for the record a telegram from the Honorable Edward P. Boland, a Representative in Congress from the Second District of Massachusetts:

Regret previous commitments preclude my joining you for hearing on our House Joint Resolutions 494 and 503 to make available more specially trained teachers of deaf, speech pathologists, and andiologists. Some 500 additional teachers are needed now to alleviate national shortage teachers of deaf children. At least 500 more needed each year in future. Only 125 teachers trained this year while there are 30,000 deaf school age children. These children will grow up to become useful productive citizens if they can obtain proper special education. The States have no training facilities to provide properly educated teachers of the deaf. I believe this must become Federal responsibility to establish a program of grants-in-aid to nonprofit educational institutions to cover cost of courses and establish scholarships for qualified persons. Two witnesses from

my congressional district who are keenly interested in this legislation will testify before you today, Principal George T. Pratt, of the Clarke School for the Deaf, Northampton, and John E. Swan, of Springfield, president, Clarke School Parents Conference. I know they are in a position to give this committee detailed and enlightened information on the need for this legislation.

Edward P. Boland, Second District, Massachusetts, Member of Congress.

Our next witness is Dr. Elwyn M. Smolen, medical director, Child Guidance Clinic of Greater Bridgeport, Bridgeport, Conn.

While Dr. Smolen testifies, I will ask the gentleman from Con-

necticut, Mr. Giaimo, to preside over the subcommittee.

STATEMENT OF ELWYN M. SMOLEN, MEDICAL DIRECTOR, CHILD GUIDANCE CLINIC OF GREATER BRIDGEPORT, BRIDGEPORT, CONN.

Mr. Smolen. I should like to begin my statement by expressing my thanks to the subcommittee, both as an individual taxpayer and as a professional in the field of child guidance and community psychiatry.

As a taxpayer, for the painstaking care and diligence with which the subcommittee is pursuing its objectives, and as a professional for the opportunity to discuss some of the unmet needs in the fields of rehabilitation and special education, needs which daily limit and frustrate our efforts in these areas.

My presentation shall be primarily from the viewpoint of a community child psychiatrist and will concern itself with some aspects of mental illness and emotional disturbances as they are involved in the

area of rehabilitation and special education.

From this point of view I should like to briefly outline a number of areas of concern which I believe might tend to become less prominent as the committee continues hearing testimony concerning needs specifically and exclusively related to the major aspects of its injury.

I believe strongly that the problems I shall mention must be dealt with if any contemplated expansion of rehabilitation and special education service is to be fully effective. They are inextricably involved with such services and yet, not being specifically so titled, might not receive the attention and support they so desperately require.

The first area of concern is the school, more specifically the preparation of teachers to deal with emotionally or physically handicapped

children, especially the emotionally disturbed child.

In any handicapping condition there exists a range in the degree of severity from minimal to severe, with the greatest number in the

lesser degrees of handicap.

The most severely handicapped—or emotionally disturbed in my particular sphere of interest—become primarily problems for therapy and are thus really not available for school or educational services, until the extent of the disturbance has been diminished by means of treatment.

The moderately handicapped or disturbed children may have their needs met best through special education programs for which teachers

are specifically trained—or should be.

However, the largest group remains the less seriously and minimally handicapped and these are almost always included in the regular class program of the school.

I submit that the selection and training of teachers is completely inadequate to equip them to deal helpfully and constructively with these children.

Furthermore, it is from the ranks of these same teachers that the

special educators are developed.

I would, therefore, respectfully suggest to this subcommittee that the following, or similar, steps, might be taken to assist in improving

this situation:

1. That the Office of Education be directed to conduct a nationwide study of curriculum and content of teacher training programs with the objective of developing suggestions and recommendations as to ways of enriching curriculum content, and teacher preparation, so that future teachers will be better equipped to deal with this aspect of their daily classroom duties.

2. That special funds be made available to teacher training programs to extend the range of summer and graduate courses so as to include both didactic and praticum work in these pertinent areas, and that scholarships be provided for practicing teachers to encourage

them to take these courses.

3. That there be increased utilization of the joint education-mental health workshops such as have been held in various States in order to further integrate these fields and improve practice at the local community level.

This may only require additional funds within existing legislative machinery available to both the Office of Education and the National

Institute for Mental Health.

The second point I should like to make is that any intensification of efforts in the fields of rehabilitation for independent living and special education for emotionally disturbed or mentally ill patients must inevitably involve greatly increased demands for diagnostic, consultative, and treatment services from existing psychiatric outpatient clinics, particularly for children.

These outpatient clinics are already unable to cope with existing needs for such services. To plan for additional demands without providing the means for increasing such services would be somewhat analogous to building an elaborate two-lane driveway from a one-

room shack to a public highway.

If this is true of such services specifically designed for emotionally disturbed and mentally ill patients, it is even more true if we consider that the rehabilitation of any handicapped individual must include some consideration of psychological and emotional factors.

In our own clinic, for example, we have been regularly receiving requests for the evaluation of children with asthma, epilepsy, other neurological conditions, orthopedic handicaps, cerebral palsy, mental

retardation, diabetes, et cetera.

I might also add that a very active source of referral to our agency is the local speech and hearing clinic where it has been found that a large percentage of speech disabilities are primarily emotional in origin.

From our point of view, to increase rehabilitational and special educational services to these various groups would only add to an already large and ever growing backlog of unmet requests for diagnosis, consultation, and treatment services, which are, in reality, unavailable.

Existing shortages of outpatient psychiatric services to children, and adults, result from two factors:

Lack of trained personnel and lack of adequate funds.

Shortages of psychiatrists, psychologists, and social workers might be partially alleviated in two ways:

First, by greatly increasing and strengthening existing training programs and stipends to trainees, as well as possibly providing funds

for expanding training institutions.

However, this in itself would not be enough. I know of excellent training positions in all three professions mentioned which are going begging because of a lack of applicants. Therefore, it would seem to be necessary to provide Federal support, both financially and perhaps even utilizing Federal personnel, to assist in developing widespread and aggressive recruiting programs at both the high school and college level, even, perhaps, including undergraduate scholarships for those who are going into these fields.

The second shortage, that of funds with which to expand service, might be met within the existing legislative framework by providing additional funds to the National Institute for Mental Health specifically earmarked for this purpose. These funds, in turn, to be allocated to the mental health authority in each State for distributions.

tion among various clinics in the State.

On this particular point, the shortage of existing psychiatric outpatient services, I would only like to add that, if the subcommittee is planning legislation in the fields of rehabilitation and special education 2 years hence, it then becomes imperative that some action be taken as soon as possible to strengthen psychiatric services.

We know from sad experience, that if funds were made available tomorrow to expand psychiatric services to any significant extent,

they could not be utilized fully for at least 2 to 3 years.

And yet, we also know that within 2 to 3 months of the establishment of a new or expanded rehabilitation or special education program in the community, there will be apparent an increased demand

for psychiatric clinic services.

The third area of grave concern is the great lack of programing of treatment services both inpatients and an outpatient day care level, for the severely disturbed, psychotic, and autistic child. These youngsters, the most profoundly disturbed of all children, whose illness begins within the first 2 years of life, would be completely unable to avail themselves of any rehabilitation or special educational services because of the profundity of their illness.

In attempting to help these children, we are faced with shortages on all sides; practically no personnel trained to deal with them in any capacity, practically no places where they can be treated, and

very little knowledge with which to attempt to help them.

And yet, they require a tremendous amount of help in order to make it possible to even approach them in the most limited and tentative way with a program of special education in a special setting.

Only a crash program of research into both cause and treatment can be expected to yield results in the next few years which would make it possible for them to be participants in the projected programs of rehabilitation and special education. I should like to conclude with one final area of major concern which is that there may be a tendency though special legislation to perpetuate the pattern of individual programs for individual groups.

Certainly one of the basic tenets of rehabilitation or of special education is that it is for the person and not for a particular disease

or disability.

Already in many communities we are seeing a healthy tendency to merge services, strengthen them through cooperation and coordination, and in brief, focus on the individual rather than on the specific

handicap.

In addition to the medical and psychological advisability of such an approach, we cannot overlook the economics involved. In the face of extreme shortages, the pooling of skilled personnel and the elimination of administrative and supervisory multiplication is an additional bonus for such an approach.

In view of the above trends, any legislation for special groups or special purposes must be very carefully designed so as to promote this

development toward a total field of rehabilitation.

While it may be true that certain special areas in the fields of rehabilitation and special education need strengthening more than others, their greatest source of strength lies ultimately in their ability to become integrated into the total field and a part of its daily practice.

In conclusion I would like to express my thanks for the opportunity

to be here today, and for the interest you have shown.

Mr. Giaimo. Thank you.

Are there any questions?

Mr. Wainright. Mr. Chairman, I would like to say that Dr. Smolen has made a very constructive statement. Most witnesses in the very brief time that they are before us do not make the concrete proposals you do in these specifics. That is particularly true of us who are politicians.

I have been on this committee for 8 years and it is with regret

that we do not have more time to pursue questions.

You started your remarks, I believe, by saying you were a citizen and a taxpayer as well as a specialist. In regard to your opening remarks then and going to your point 1, which is found at the bottom of page 2 of your testimony, you refer there to the fact that the Office of Education ought to direct aid toward curriculum and teacher

training and come up with specific recommendations.

I wonder whether you are not suggesting that the Federal Government get into a field that heretofore it has never been in, particularly with regard to curriculum and teacher training because if you apply it to this and then you carry it to its logical steps in other fields, you find that the Federal Government is making specific recommendations to teacher training and curriculum and fields of history, philosophy, religion, once you go into a field of education which in essense is what your recommendation comes down to.

I wonder if you would care to comment on that.

Mr. Smolen. I think this is a very important point.

Yet it seems to me if this is a national problem it requires a national agency to coordinate efforts to alleviate it.

Mr. Wainright. Of course, all education is a national problem.

Mr. Smolen. Is it not quite possible, perhaps, that through the Office of Education an interstate committee might be organized which could accomplish the same purpose and yet avoid the onus of bearing the Federal seal upon its practice?

Mr. Wainright. Do you know of any other organizations that might be doing this in a research capacity, such as the Ford Foundation, or the Carnegie Fund, or something of the sort that might have a special

project or would conduct a special project in this field.

Mr. Smolen. I am afraid I cannot speak specifically to exact items. There have been a number of studies and research programs with relatively small groups of teachers developing within these programs a greater sensitivity and awareness of children's problems and disabilities.

Our own clinic has had some such projects, a number of others in

the State and throughout the country.

Again we run into a situation where the most part these become demonstration projects and once funds for the demonstration aspect have expired, then it becomes relatively impossible to continue them in any kind of permanent service basis.

Mr. Wainright. It is too bad, Mr. Chairman, we do not have more

time for a complete witness.

Mr. Giaimo. Thank you, Dr. Smolen.

The next witness is Dr. Francis Irons, director of vocational rehabilitation, Department of Education, Montpelier, Vt.

STATEMENT OF FRANCIS S. IRONS, DIRECTOR, VOCATIONAL REHABILITATION DIVISION, DEPARTMENT OF EDUCATION, MONTPELIER, VT.

Mr. Irons. Mr. Chairman and members of the Subcommittee on Special Education and Rehabilitation, may I first also commend very highly this procedure you have adopted to get at the grassroots thinking on subjects under consideration.

The Vermont Vocational Rehabilitation Division has been operating for nearly 4 years a halfway house program for the hospitalized

mentally ill in close cooperation with the State hospital.

We believe it has been highly successful.

I wish to emphasize three points which I think constitute needs and these have been presented to some extent in the workshop reports, or will be.

There should be real inducement offered in the filed of mental hospital construction to promote the development of any hospital rehabilitation facilities and programs. The building of more custodial care units while neglecting rehabilitation services is to perpetuate an obsolete approach to our No. 1 handicapping disease of mental illness.

Another item which our experience in this field is just now pointing out is the need for careful followup of the ex-mental hospital patient

on both the service and research phases.

My colleague, the chief psychologist from the State hospital, who has been here for the workshop, says return to hospital peak at 3 months.

Adequate supporting funds from Federal sources to extend followup research in the area of rehabilitation of the mentally ill should be

of great national benefit in this new field.

Third, we found in our halfway house program the large percentage of the hospitalized mentally ill had lost all family and community ties and support. Those who had been in hospitals in 5 to 20 years, and the average was over 5 years for most of the initial groups, had no economic backing in the community to which they would return. They were literally destitute, as the earning power was restored and they were still making social adjustments we arranged to permit these halfway house clients to accumulate a modest amount of liquid assets in the form of savings accounts at the same time they began to pay part of the costs of their board and room in the halfway house facility.

This accumulation of a reserve we found was a great incentive to those still in the hospital, and it helped provide that feeling of security which leads to complete independence in the community.

However, the Federal auditors caught up with us. They said that the rehabilitation account, Public Law 565, requires that earnings while in the rehabilitation process must be applied in full to the cur-

rent cost of the individual's rehabilitation program.

Now, in determining the applicant's eligibility in general for financial assistance in applying the means test, Public Law 565 permits that the State plan for vocational rehabilitation exclude as available resource a modest amount in liquid assets in order to provide a reasonable degree of economic stability and a reserve for unexpected emergencies.

We strongly believe that rehabilitation clients who earn during the rehabilitation process should have the same degree of stability and

reserve for emergencies.

Therefore, we would recommend that Public Law 565 be amended to permit vocational rehabilitation clients who as applicants were devoid of such assets, but who, while in the active process of rehabilitation become earners, to accumulate from their earnings liquid assets equal to the amount which the approved State plan would have permitted them to exclude as available resource before their rehabilitation program began.

Another one of our concerns is the public acceptance of persons recovered from mental illness, or who are otherwise mentally handicapped, such as the retarded. They need fair opportunity in finding

employment.

May I state very briefly a need of considerable importance, then, the name of the President's Committee on the Employment of the Physically Handicapped should be changed by deleting the word "physically." While it remains in the title it implies that this committee does not have sufficient confidence in the employability of those who have mental handicaps to give them their backing.

I would like to emphatically endorse what Congressman Fogarty said about the need for services to help individuals who are not capable of achieving complete vocational independence to become as much interested as they can and, therefore, not have to remain in

nursing homes, hospitals, and institutions.

However, it may appear if rehabilitation people themselves through modesty do not speak up in regard to where this program of independent living services should be administered, that it will go by default.

Rehabilitation agencies operate in a philosophy of independence rather than dependence; over the years they have acquired the experience and know-how to provide this kind of service effectively and

make these individuals reasonably independent.

Also, these are the agencies which, if in the process of rehabilitation for independent living greater feasibility for vocational success is demonstrated, the rehabilitation agencies are the ones who would carry out the balance of the vocational preparation.

Therefore, I would like to emphasize that these services should be provided in the States by the presently constituted vocational rehabili-

tation agencies.

One additional point: I would like to second Mayor Lee's statement

in regard to sheltered workshops.

Large metropolitan areas in large cities have over the years been able to have this kind of facility. The sheltered workshop is one of the most down-to-earth and practical facilities for returning severely handicapped people to employment, particularly mentally ill and mentally retarded.

But rural areas have not been able to develop these facilities. I think Federal assistance to help rural areas develop sheltered work-

shops is of great importance.

I thank you very much for the privilege of appearing before you. Mr. Giaimo. We thank the gentleman for coming down from Vermont.

Are there any questions from members of the committee?

Thank you very much.

The next witness will be George T. Pratt, Clarke School for Deaf, Northampton, Mass.

STATEMENT OF GEORGE T. PRATT, PRINCIPAL, CLARKE SCHOOL FOR DEAF, NORTHAMPTON, MASS.

Mr. Pratt. Mr. Elliott and members of the committee, thank you for your invitation to me to offer testimony with regard to House Joint Resolution 494, introduced by Mr. Elliott, and its companion resolutions, 488, 503, 507, 512, 516, and 526, presently under consideration by your committee.

I strongly support the resolution and urge an early and favorable

recommendation by your committee.

This is the position taken by the Conference of Executives of American Schools for the Deaf, the Alexander Graham Bell Association for the Deaf, and the Convention of American Instructors of the Deaf, which are the three national organizations representing our profession across the country.

The formal education of a deaf child is a highly specialized field and a particularly difficult one. Coming to us without the ability to speak, to understand speech, to read, or to write, he requires special education procedures which are designed to help him compensate for his hearing loss. He must achieve facility with language, in both its receptive and expressive forms, if he is to fulfill his potential as a human being.

The odds against him seemed to be such that for 210 years following the settlement of Jamestown there was no organized educational

program for him in this country.

From the establishment of the American school in 1817 until the present, great strides have been made on behalf of the deaf. There are now 365 schools and classes for deaf children in the United States serving some 30,000 students.

Mr. Elliott. Did I understand you to say there are 300 schools

and classes?

Mr. Pratt. Yes.

Mr. Elliott. Does that include classes in public schools?

Mr. Pratt. Yes, sir. A school for the deaf would be a facility which has a program only for deaf children. A class for the deaf would be a classroom within a public school, administered by the public school system, but having one or more classes to take care of deaf children within the public school system.

Mr. Elliott. I thought there were more than that?

Mr. Pratt. There are 365 according to the 1959 American Annals of the Deaf.

There are approximately 4,000 teachers of the deaf.

Now, not one of us is satisfied with our present accomplishments, educationally or administratively, and we are anxious to progress.

Love, affection, and compassion make life more agreeable for the deaf child, but these alone are not enough to open up the doors of opportunity and fulfillment. The professional knowledge and skill of specially trained classroom teachers of the deaf is essential.

What are some of the areas in which classroom teachers of the deaf

require special training:

1. Speech: How to teach a deaf child to produce speech which is intelligible to his hearing contemporaries when he can hear neither

the speech of others to imitate, nor his own efforts to speak.

2. Language: How to teach a deaf child the flow of connected language including word sequence of accepted usage, tense, agreement of subject and verb, pronouns, et cetera, ad infinitum, when he does not hear the spoken word.

Consider the struggle of hearing children with spoken and written language even though they are constantly exposed to it from birth.

3. Curriculum: How to organize and present learning experiences and subject matter to deaf children that they might acquire the basic fundamentals which will enable them to learn and explore independently.

4. Auditory training: How to exploit the residual hearing which most deaf children possess through modern amplification equipment. In addition to assisting with lipreading, this helps in contending with the feeling of "aloneness" peculiar to deafness, and contributes toward a sense of being a part of the world, as well as being in it.

5. Psychology: How does the lack of hearing experience affect the

thinking, responses, and attitude of deaf children and adults?

6. Observation and practice teaching: Daily contact with deaf children in well-graded classes over an extended period of time under the guidance and supervision of experienced teachers is necessary in training teachers of the deaf.

There are other special courses which teachers in training must take to meet minimum certification requirements recognized by our profession. At least 1 full academic year of special training is necessary to prepare one's self to teach deaf children.

For the record, I offer this little pamphlet containing information

on the 25 training centers. I will not read it.

Mr. Giaimo. It will be made a part of the statement and put in the record, without objection.

Mr. Pratt. Thank you, sir.

(The pamphlet referred to follows:)

[Pamphlet submitted by George T. Pratt, Clarke School for Deaf]

INFORMATION FOR PROSPECTIVE TEACHERS OF THE DEAF

(For schools for the deaf, classes for the deaf, speech and hearing clinics, and rehabilitation facilities for the deaf in the United States and Canada)

A STIMULATING PROFESSION

One of the most rewarding areas in specialized education is that of teaching the deaf. Although this area is in the general field of education, it is closely allied with the fields of medicine, psychology, speech, language disorders, electronics, rehabilitation, audiology, public health, and social work. The work is of such a specialized nature that additional training is necessary.

The need for teachers in this particular area of special education is acute. A scarcity of qualified personnel exists throughout the United States and Canada. Positions are available in public and private residential schools, day schools, and

in day classes.

Trained teachers of the deaf are also needed in many speech and hearing clinics located in colleges and universities, schools for the deaf, private centers, hospitals,

and in medical schools.

Scholarships are available for teacher trainees in the majority of the training centers. Interested applicants should write to the directors of the teacher training centers for details and refer to information on scholarships at the various centers in this brochure.

Information concerning the 25 teacher training centers meeting standards approved by the Conference of Executives of American Schools for the Deaf and the courses necessary for a teacher's certificate are included in this brochure. Training is offered in various centers on the graduate and the undergraduate levels.

MINIMUM COURSE REQUIREMENTS TO BE INCLUDED IN A PROGRAM FOR PREPARATION OF TEACHERS OF THE DEAF IN CENTERS MEETING THE STANDARDS APPROVED BY THE CONFERENCE OF EXECUTIVES OF AMERICAN SCHOOLS FOR THE DEAF.

I. Following are the minimum course requirements that are to be included in a teacher preparation program for those training centers to be approved by the Conference of Executives of American Schools for the Deaf. Suggested minimum and maximum semester hours of credit are indicated for each course. It is recognized that course content rather than course title is the guide.

	Semeste	er hours
	Mini- mum	Maxi- mum
A. The teaching of speech to the deaf. This course should include a study of the principles and techniques used in developing the formation of English sounds by the analytical method and also the introduction of speech decies in the hard of hearing, but the major emphasis to the correction of speech decies in the hard of hearing, but the major emphasis deaf child. It is essential that demonstrations and practice but and choleage deaf child. It is essential that demonstrations and practice out and course should include special consideration of the speech problems of the deaf child with multiple handicaps.	4	6
B. The teaching of language to the deaf. This course should include a study of the principles and techniques of teaching language to the preschool and school-age deaf child. The student should become familiar with the leading systems of teaching language to the deaf and should become familiar with the step-by-step development of at least 1 language system. The material in "Outline of Language for pead Children," by Edith M. Buell or the "Language Outline," prepared by a committee of teachers at the Central Institute for the Deaf or similar material should form the basis of this course. The course should include consideration of the language problems of deaf children with multiple handicans.	4	6
C. Methods of teaching elementary school subjects to the deaf This course should include principles and methods of teaching reading to deaf children in the lower and higher grades. Methods of teaching subjects such as arithmetic, social studies, and science should be considered in this course. Par- ticular emphasis should be placed on methodology in the intermediate and ad- vanced grades. This course should also include consideration and use of visual aids in classes for the deaf.	4	6
D. Methods of teaching speech reading (lipreading) to the deaf and the hard of hearing— The various principles and techniques of teaching speech reading should be studied. Familiarity with such methods as the Nitchie, Jena, Kinzie, Müller- Walle and others, and research pertaining to lipreading should be a part of this course.	2	3
E. History, education, and guidance of the deaf. This course should cover the history of the education of the deaf and the evaluation of the place of the deaf in the community from social, economic, and political viewpoints from ancient times to the present. The course should help the student become familiar with the bibliographic source materials in the field on the education and welfare of the deaf. Research studies related to the psychology of the deaf, social adjustment of the deaf, and studies related to the learning problems of the deaf should be considered. The student should become familiar with the place of the adult deaf in today's society.	2	3
F. Auditory and speech mechanisms This course should include a study of the anatomy, physiology, and pathology of the speech and hearing mechanisms.	2	3
G. Hearing tests and auditory training. The techniques and interpretation of pure tone hearing tests and an introduction to speech audiometry should be included in this course. Audiogram interpretation and at least 10 air and bone conduction tests should be completed on children of varying ages who are in schools or classes for the deaf. The students should be introduced to several types of amplification systems used in schools and classes for the deaf. In auditory training, the student should learn the techniquies and principles of auditory training with special reference to such programs in schools and classes for the deaf.	2	3
H. Observation and student teaching. Facilities for observation of classroom procedures and student teaching should be sufficiently extensive so that the deaf pupils are well graded. This implies at least 6 classes at different grade levels, including preschool if possible. The student should be required to do at least some practice teaching under direct supervision on several grade levels, in order that he might have an understanding of the overall educational problems of the deaf child.	6	10
Total semester hours	26	40

¹ The revised set of requirements was adopted at the meeting of the Conference of Executives of American Schools for the Deaf in Colorado Springs, Colo., June 30 and July 1, 1959.

II. (1) The above minimum course requirements presuppose that the student has had work in the area of education, preferably a major in elementary education. The student should have had, or should be taking concurrently, a course in child growth and development, and a course in the psychology or education

of the exceptional child.

(2) Upon request, training centers established in the future will be evaluated by a subcommittee of one or more members of the conference of executives appointed by the chairman of the teacher training and certification committee. The criteria listed in section I will be used for evaluation of new training centers until such time as these requirements are changed by majority vote of the members of the conference of executives.

REVISION OF REQUIREMENTS FOR CLASS A AND CLASS B CERTIFICATION

CONFERENCE OF EXECUTIVES OF AMERICAN SCHOOLS FOR THE DEAF 2

Class A-Academic

To be eligible for this certificate the following three requirements must be met:

1. All candidates for a class A certificate must hold at least a bachelor's degree

from an accredited college or university.

2. All candidates for a class A certificate must have satisfactorily completed a program of preparation as a teacher of the deaf at a training center which has been evaluated and approved by the Conference of Executives of American Schools for the Deaf. Deaf graduates of Gallaudet College who major in education will meet this requirement.

3. Following the preparation, 3 years of successful teaching experience under qualified supervision is required for a permanent certificate. A temporary certificate may be granted following preparation and before the necessary experi-

ence is completed.

In lieu of the above requirements, this class A certificate may be granted when, in the judgment of the certification committee, applicants have qualified through executive or administrative positions or distinguished service in education of the deaf.

Class B—Academic

To be eligible for this certificate the following two requirements must be met: 1. All candidates for a class B certificate must hold at least a bachelor's

degree from an accredited college or university.

2. (a) Completion of 24 semester hours in the education of the deaf, such courses being subject to the approval of the teacher training and certification committee of the conference of executives, and the 3 years of teaching experience with deaf children; or

(b) Completion of 8 years of satisfactory teaching experience with deaf children, attested to by a supervisor or administrator of a school for the deaf. These requirements are to become effective September 1, 1959. Applicants for

certification who completed their preparation to teach the deaf before this date will be evaluated on the basis of requirements previously in effect.

Directors of training centers making application for evaluation and approval of a teacher education program should write to Dr. Howard M. Quigley, chairman of the Teacher Training and Certification Committee, Conference of Executives of American Schools for the Deaf, Minnesota School for the Deaf, Faribault, Minn.

Teachers of the deaf making application for certification should write to Dr. Richard G. Brill, secretary of the Teacher Training and Certification Committee, Conference of Executives of American Schools for the Deaf, California

School for the Deaf, Riverside, Calif.

The revised set of requirements was adopted at the meeting of the Conference of Executives of American Schools for the Deaf in Colorado Springs, Colo., June 30 and July 1, 1959.

Information on Scholarships, Fellowships, and Stipends in Teacher Training Centers for the Deaf

ARKANSAS SCHOOL FOR THE DEAF, LITTLE ROCK, ARK.

Room, board, and laundry, free of charge.

Tuition is reduced by the University of Arkansas to \$50 per semester.

SAN FRANCISCO STATE COLLEGE, CALIFORNIA

Several cash scholarships ranging from \$1,000 to \$1,500 are awarded annually. These are granted with the understanding that the students complete the program for certification during the following year and are subject to an agreement to teach deaf children for at least 2 years following completion of preparation. Application must be made before March 1. Forms for application become available after the first of January. For further information address director of admissions. San Francisco State College, 1600 Holloway Avenue, San Francisco. Calif.

JOHN TRACY CLINIC, LOS ANGELES, CALIF.

A number of tuition scholarships of \$900 each are available to senior undergraduate students or candidates for the master's degree. These include two Disney Foundation scholarships, the Westlake Alumnae scholarship, and several from anonymous donors.

The scholarships are granted jointly by the John Tracy Clinic and the University of Southern California. For further information regarding financial aid write to the administrator, John Tracy Clinic, 806 West Adams Boulevard, Los Angeles, Calif., and to the director of admissions, University of Southern California, Los Angeles, Calif.

GALLAUDET COLLEGE, WASHINGTON, D.C.

Financial assistance: Students in the regular session receive free tuition and maintenance. Those in need of further assistance may apply for a national defense student loan in any amount up to \$1,000 or for the Kiwanis scholarship of \$500. For further information, including application forms for admission, write to the registrar, Gallaudet College, Washington, D.C.

IOWA SCHOOL FOR THE DEAF, COUNCIL BLUFFS, IOWA

The in-service teacher-training program of the Iowa School for the Deaf is affiliated with both the University of Iowa and the University of Omaha, and is approved by the Conference of Executives of American Schools for the Deaf.

In this unique program, teachers with baccalaureate degrees are hired at full salary, as teachers of the deaf, with the understanding that they take the complete teacher-training program. Working closely with supervising teachers, these teachers-in-training carry a full teaching load and take classes in education for the deaf after school hours on the campus of the Iowa School for the Deaf.

For further information, write to the superintendent, Iowa School for the Deaf, Council Bluffs, Iowa.

THE UNIVERSITY OF KANSAS MEDICAL CENTER, KANSAS CITY, KANS., AND THE KANSAS SCHOOL FOR THE DEAF, OLATHE, KANS.

The University of Kansas Medical Center, in cooperation with the Kansas School for the Deaf, has the following financial aid available to students:

1. A student may receive room, board, and laundry at the school in exchange for a few hours of work a week with the children and/or

2. Stipends ranging from \$300 to \$750 for the year. Transportation is provided between the School for the Deaf in Olathe and the University of Kansas Medical Center in Kansas City Kans, for those who live at the school

Medical Center in Kansas City, Kans., for those who live at the school. Fees and tuition payable by out-of-State students amount to approximately \$260. For further information write to Dr. June Miller, University of Kansas Medical Center, 39th and Rainbow, Kansas City, Kans., and/or Stanley D. Roth, superintendent, Kansas School for the Deaf, Olathe, Kans.

THE CLARKE SCHOOL FOR THE DEAF, NORTHAMPTON, MASS.

The fees for the school year are as follows: tuition, \$1,200; room and board, \$600. Clarke School awards a full tuition scholarship to each student admitted in the teacher education department. Some scholarship aid in the form of minor duty assignments which will not interfere with studies, to be applied against the \$600 fee for room and board is available. For further information write to Dr. George T. Pratt, principal, the Clarke School for the Deaf, Northampton, Mass.

WAYNE STATE UNIVERSITY, DETROIT, MICH.

Wayne State University has an unlimited number of tuition scholarships (\$100 up to \$500) for Michigan residents preparing initially to teach the deaf; three or four graduate assistantships paying approximately \$2,000 with some tuition waivers at the master's level; and four research associate fellowships paying up to \$3,000 with some tuition waivers at the doctoral level. For further information write to Dr. John Gaeth, professor of audiology, Speech and Hearing Clinic, Wayne State University, 656 West Warren, Detroit, Mich.

EASTERN MICHIGAN UNIVERSITY, YPSILANTI, MICH.

Horace H. Rackham School of Special Education

Eastern Michigan University students who are pursuing a program in the area of the acoustically handicapped are eligible for many scholarships and grants-in-aid.

Six annual \$150 scholarships are sponsored by the Dearborn Lions Club. Other students who show need and agree to teach in Michigan for a period of time, are eligible for scholarships from the Michigan Society for Crippled Children and Adults. Students in the area of the acoustically handicapped are also eligible for one of the many (approximately 525) State board scholarships. Many other students get assistance through the loans provided by the National Defense Education Act of 1958. The Rackham dormitory provides jobs for approximately 20 to 25 students per year. Graduate students are eligible for student assistantships at the Rackham School.

For further information contact Dr. Allen Myers, director, Rackham School of Special Education, Eastern Michigan University, Ypsilanti, Mich.

CENTRAL INSTITUTE FOR THE DEAF, ST. LOUIS, MO.

A matriculation fee of \$5 is required upon registration.

Tuition for each year is \$300, payable as follows: \$25 initial payment upon acceptance for admission, \$125 at opening of first semester and \$150 at the beginning of each subsequent semester.

A diploma fee of \$3 is payable prior to graduation.

Room and board are available to college students at the rate of \$660 per academic year, payable monthly in advance. Students are not accepted for room or board separately. Commitment must be made for both services.

A laboratory fee of \$10 is payable in those graduate courses requiring the use of animal material.

An outlay of \$100 for books and supplies is sufficient to carry the student for the entire course.

An annual health service fee of \$2 is required in advance.

Scholarships and self-help

The Max A. Goldstein scholarship.—This scholarship is derived from annual contributions of the alumni of the teachers training college and provides tuition fees for 1 year. Award is made to a student usually in the senior year, upon recommendation of the college faculty. Other scholarships and some grants-in-aid are available to qualified students.

Opportunities for self-help through remunerative employment on the premises of the institute are available. This employment usually consists of counseling with the children after school hours, study hall, and clerical duties. Students are also permitted to sign promissory notes to meet tuition obligations.

Application for scholarships, employment, and loans should be addressed to the Registrar, Central Institute for the Deaf, 818 South Kingshighway, St. Louis, Mo.

THE LEXINGTON SCHOOL, NEW YORK, N.Y.

The Lexington School teacher preparation program is affiliated with Teachers College, Columbia University, and provides the basic program for the prepara-

tion of teachers of the deaf in the department of special education.

The Lexington School has a program of scholarship assistance for those candidates who indicate need for such help. Application for such scholarship grants must be made in writing. Resident scholarships have a value of \$1,200 and provide board, room, and laundry at the Lexington School for the academic year, and \$200 in cash. Nonresident scholarships provide \$200 in cash and lunch and dinner at the school on school days. One-half of the cash scholarships will be paid in September, the other half in January. In addition, under certain conditions, those members of the teacher preparation department who need financial assistance during the year in order to complete their program may apply to the Lexington School for non-interest-bearing loans up to \$500. Half of this amount may be borrowed in the first semester, the other half in the second semester. These loans may be repaid after the student-teacher secures employment. Under certain conditions, fellowships, scholarships, or loans may be secured from Teachers College, Columbia University. Inquiries concerning these should be addressed to the chairman of the Committee on Fellowships and Scholarships of Teachers College prior to December 15 preceding the academic year for which the student-teacher is appointed.

ST. MARY'S SCHOOL FOR THE DEAF, BUFFALO, N.Y.

St. Mary's School offers 10 assistant-teacher positions each year, at a salary of \$1,800. The student-teacher helps in the coaching of individual pupils assists in preschool and other classes, acts as substitute teacher, etc. The training classes are usually held either before or after school hours.

For further information write to the Director, teacher training program, St.

Mary's School for the Deaf, Buffalo, N.Y.

SYRACUSE UNIVERSITY, SYRACUSE, N.Y.

No scholarships available.

NEW JERSEY SCHOOL FOR THE DEAF

The teacher-training program is a combined in-service and graduate program. The trainees are first- and second-year classroom teachers receiving beginning salaries.

The program is affiliated with Trenton State College. Twenty-two hours credit in special education courses pertaining to the deaf are required. A student may earn a master's decree with 10 additional hours credit.

The tuition is \$13.50 per point.

For further information write to Mr. C. M. Jochem, superintendent, New Jersey School for the Deaf, West Trenton, N.J.

NORTH CAROLINA SCHOOL FOR THE DEAF, MORGANTON, N.C.

The North Carolina School for the Deaf has six working scholarships for teachers in training. A trainee receives \$82.50 per month for 10 months. For this amount the trainee fills part-time positions in the library, school offices, and as assistant in physical education and as substitute houseparent. From the amount received, the trainee must pay \$50 per month for room, board, and laundry, and \$250 per year to the North Carolina School for the Deaf and the affiliating college for tuition.

The scholarships granted at the North Carolina School for the Deaf are designed to encourage desirable candidates by affording them training at no

cost to them, other than their part-time services to the school.

The positions are designed to give the trainee contact with the deaf student in and out of school, so that the trainee can acquire a better understanding of the deaf child.

For further information write to Ben E. Hoffmeyer, superintendent, North Carolina School for the Deaf, Morganton, N.C.

THE UNIVERSITY OF OKLAHOMA MEDICAL CENTER, OKLAHOMA CITY, OKLA,

Graduate assistantships, research assistantships, and office of vocational rehabilitation assistantships are available for those studying in audiology, speech pathology, or in the teaching of the deaf. For further information write to Dr. John W. Keys, 825 NE. 14th Street, Oklahoma City, Okla. Scholarships run from \$1,320 to \$2,800 a year.

OKLAHOMA COLLEGE FOR WOMEN, CHICKASHA, OKLA.

Scholarships granted by the American Business Clubs are available to junior and senior students. Applicants for scholarships should apply through local American Business Clubs or to Robert Park, chairman, National Committee on Scholarships, Federal Savings & Loan Building, Chickasha, Okla. Scholarships may cover tuition, room, and board, and cost of books.

THE WESTERN PENNSYLVANIA SCHOOL FOR THE DEAF, PITTSBURGH, PA.

For scholarship arrangements write to Superintendent Sam B. Craig, 300 Swissvale Avenue, Pittsburgh 28, Pa.

THE DE PAUL INSTITUTE FOR THE DEAF, PITTSBURGH, PA.

The teacher training program was designed primarily to supply DePaul's need for qualified oral teachers. Others are accepted when openings in the program are available.

Applicants should have a bachelor's degree from an accredited college or university, and a State teacher's certificate. The course is of 2 years' duration.

Tuition scholarships, room, and board are available for qualified applicants. For further information write to the director, the DePaul Institute, Castlegate Avenue, Pittsburgh, Pa.

SOUTH CAROLINA SCHOOL FOR THE DEAF, SPARTANBURG, S.C.

The teacher-training program offered by the South Carolina School for the Deaf in cooperation with Converse College, is a 2-year undergraduate course carrying 26 hours of college credit. The course is open to juniors and seniors who have the approval of the dean of faculty at Converse College and of the assistant superintendent of the school for the deaf.

For further information write to Mr. N. F. Walker, assistant superintendent. South Carolina School for the Deaf and the Blind, Spartanburg, S.C.

SOUTH DAKOTA SCHOOL FOR THE DEAF, AUGUSTANA COLLEGE, SIOUX FALLS, S. DAK.

A variety of scholarships for freshmen, and upper classmen are available, on a competitive basis, upon application. In general, to be eligible for an Augustana scholarship, the student applicant must present an academic record of unusual quality, show promise of achievement and aptitude for college work, have good character and a record of leadership in school, church, and community life, and demonstrate financial need.

All scholarships, grants-in-aid, assistantships, part-time jobs, loans, and similar types of financial aid to students are administered by a faculty committee on student aid. In addition to the above types of college aid, there are several student assistantships for board and room available from the South Dakota School for the Deaf, for students who assist in their program.

For further information write to Augustana College or Prof. Richard W. Flint, director, education program for teachers of the deaf, Augustana College.

TENNESSEE SCHOOL FOR THE DEAF, KNOXVILLE, TENN.

The superintendents of the special schools under the administration of the State board of education are authorized to allow grants-in-aid for graduate study to selected faculty members, subject to individual approval by the State board of education and to the conditions set forth below:

(1) Any professional staff member of the special schools under the control of the State board of education now employed, or who may be employed in the future, shall be eligible to apply for a grant-in-aid for study in the field of specialization required by the school.

(2) No grant-in-aid shall be made to a faculty member to do graduate work toward a doctorate or a master's degree in a field other than the field of specialization in which he is now working at the institution, or the field of specialization

in which he will be employed upon his return to the institution.

(3) The recipient of a grant-in-aid shall agree to remain as an employee of the institution making the grant for a period of time equal to twice the time for which he received a grant-in-aid from the institution, but under no circumstances will a grant-in-aid be made unless the recipient agrees to remain with the institution for 1 full year after the completion of his graduate work. Failure of the recipient to remain for the period of the agreement will result in the repayment of the amount granted the recipient according to the terms of his contract, with interest at 6 percent.

(4) Full grants-in-aid may be made for a subsistence and maintenance stipend only for a faculty member who is planning three continuous quarters or two continuous semesters of graduate work on the doctoral level or beyond a master's degree. A grant of tuition, plus one-half subsistence, may be allowed for summer

school attendance.

(5) The amount of the individual grant-in-aid will depend on the needs and circumstances of the individual.

For further information write to W. Lloyd Graunke, Ph. D., chairman, superintendent, Tennessee School for the Deaf.

WASHINGTON STATE SCHOOL FOR THE DEAF, VANCOUVER

The training center at the Washington State School for the Deaf offers complete teacher training, recognized by the Conference of Executives of American Schools for the Deaf, with accreditation by Lewis and Clark College of Portland, Oreg. Upon completion of the 9-month course on the State school campus in Vancouver, under certified educators in the teacher training area, the trainee is allowed 32 semester hours undergraduate credit or up to 16 hours graduate credit. No charge is made to the trainee for training school facilities, materials, and supplies. The trainee pays one single fee, a reasonable tuition fee, set by the college.

THE UNIVERSITY OF WISCONSIN: MILWAUKEE, MILWAUKEE, WIS.

University freshman honor scholarships for Wisconsin residents are awarded to the top-ranking students in each graduating class upon recommendation of the high school principal.

University freshman tuition and cash scholarships for Wisconsin residents are available upon application. Need and academic record are qualifying consider-

ations

Continuing students, including nonresidents, are eligible for university scholar-

ships, both eash and tuition, upon application.

The Winnie Memorial Award of \$50 is available to senior students majoring in the education of the deaf. An occasional scholarship of \$100 is presented by the American Business Women's Association.

For further information, write to Miss Alice Streng, chairman, department of exceptional education, the University of Wisconsin: Milwaukee, Milwaukee, Wis.

Mr. Pratt. There is an acute nationwide shortage of trained class-room teachers of the deaf. This has been substantiated by a study conducted this year by Johnston & Frisiana, the facts and conclusions of which will be introduced into this hearing by Mr. Fred D. Knittle, who has been designated by the Conference on Executives of American Schools for the Deaf, to speak for that organization.

Over the past 10 years I have attended many of our professional meetings and heard papers and panels given at each directed to the problem of the teacher shortage. The net tangible result seems to have

been a steady worsening of the situation.

A basic problem of finances is involved. After students have completed 12 years of elementary and high school, then committed their families to the expense of college or university, it is natural for them

to want financial independence and to proceed at once to accept

employment.

Many college students may have an active interest in preparing themselves to teach deaf children, but feel they cannot ask their parents to support them financially during the training period required. Thus, our profession loses teachers and future leaders.

This national shortage of classroom teachers of the deaf began during World War II and has persisted until today, becoming more acute year by year. Its effects are detrimental no matter how schools for

the deaf may have attempted to accommodate themselves to it:

By admitting fewer children;

2. By enlarging the number of children in classes;

3. By employing untrained teachers and attempting an "in-service"

training program.

The limited numbers of students flowing into our training centers has persisted so long that our profession now faces further significant difficulties which are directly associated with the basic shortage.

Schools are not able to find supervising teachers, principals, or super-

intendents to administer educational programs.

During the past 5 years we have received letter after letter asking us to recommend persons for highly responsible and well paid positions, but good people are already holding positions of leadership

and do not wish to change.

Directors of our research departments have not been able to develop enough young scientists who are interested directly in our special field to mount a truly substantial research effort. Even though the many ramifications of deafness present the most stimulating and challenging possibilities, research grants to our special field have been meager: It is becoming increasingly difficult to staff the training centers themselves.

The problem we are outlining here lies at the heart of our profession,

and the situation is critical.

If the provisions of this resolution were to go into effect immediately,

it would take us 10 years at least to catch up.

We urge you, with all sincerity, to place House Joint Resolution 494 high on your agenda for consideration when Congress reconvenes in January. Early favorable action will make it possible for us to try to fill our training centers with students for the school year beginning in September 1960. Recruiting reaches its peak in February and March.

Thank you very much.

Mr. Giaimo. Are there any questions by the members of the committee?

We thank you at this time, Mr. Pratt, for your testimony today.

The next witness is Mrs. Albert M. Grass, president of the American Epilepsy Foundation, Quincy, Mass.

STATEMENT OF MRS. ALBERT M. GRASS, PRESIDENT, AMERICAN EPILEPSY FOUNDATION, QUINCY, MASS.

Mrs. Grass. I want to speak to you briefly about the educational needs of the epileptic child emphasizing that these are not specific to New England or indeed, to the United States. but a worldwide problem.

In the United States today there are an estimated million and a half persons with epilepsy. Of these, 75 percent, or well over a million,

are under the age of 20.

Epilepsy is largely controllable. Now, through the use of anticonvulsant drugs and occasional surgery, seizures can be completely eliminated for 50 percent and for 30 percent reduced appreciably.

Therefore, 80 percent of the epileptic population, if properly treated

medically, can live normal lives.

Of the remaining 20 percent, 15 percent can still function in everyday society to a limited extent with poorly controlled seizures, and

the remaining 5 percent are institutionalized.

It is extremely important to remember that many persons have other medical problems along with epilepsy which are frequently more of a handicap than are the seizures. These conditions may include cerebral palsy, mental retardation, or emotional disturbances. Epilepsy is not ordinarily the cause of these complication factors, but merely coexists with them.

For centuries the epileptic has been considered unclean, possessed

by demons, insane, and dangerous.

Even in this era of enlightened social conscience and medical so-

phistication, such attitudes persist.

For example, a history of epilepsy bars entry to this country even as a visitor. Likewise, a recent poll indicates that about 40 percent of persons don't want their children associating with children who have epilepsy.

It is largely this unreasoning fear and ignorance which complicates the educational opportunities for children with epilepsy. The epileptic is by no means stupid. It has long ago been statistically proved that the IQ of the epileptic population is as high, or even a little

higher, than normal.

Most physicians and lay persons experienced in epilepsy feel that special educational facilities are not needed nor are they desirable for the epileptic child. Rather, he benefits from attendance at regular school classes. When this is not possible, he should receive special educational attention through existing community facilities.

The educational needs fall into three categories:

1. The children able to attend regular classes:

The children able to attend regular classes;
 Those who must attend special classes;

3. Those who need home teaching.

A. THE CHILD WHO CAN ATTEND REGULAR CLASSES

The 50 percent with full seizure control normally are admitted to regular classes, but in some instances, school systems impose unrealistic restrictions through ignorance of the disorder.

Those children with partial control should also be admitted without prejudice to regular school classes. This is not taking place. They

are not made welcome.

The Massachusetts Department of Public Health in a 1958 survey, found that only 67 percent of the 90 percent of children with epilepsy capable of attending classes, actually went to school. The reasons are:

1. Outdated attitudes about epilepsy;

2. Crowded classrooms;

3. The unpleasant nature of seizures cause teachers and officials to consider the child uneducable and disruptive;

4. Lack of epilepsy clinics and trained staff prevent maximal bene-

fit from existing modern treatment methods;

5. Level of seizure control is less than that possible when optimal medical care is given;

6. Lack of public education in general, and lack of knowledge about

epilepsy on the part of educators.

In Massachusetts, a State known for its medical sophistication, only about 50 percent of epileptics are treated. Nationally, this figure drops to a scandalous 20 percent.

The following suggestions are respectfully submitted for your

consideration:

1. Encourage the establishment of neurology clinics by making funds available to communities for that purpose.

2. Encourage young physicians to specialize in neurological disorders by increasing research and training grants in this specialty.

3. Develop through the U.S. Public Health Service an intraining education program for physicians in subjects relating to epilepsy.4. Make additional funds available through the Crippled Children's

Services for the diagnosis and treatment of epilepsy.

5. Take an active role in eliminating ignorance of schoolteachers and officials through—

(a) A national conference of educators about epileptic chil-

dren;

(b) Funds for local conferences of similar nature;

(c) Provision of educational materials to school officials about

epilepsy;

(d) Encourage those colleges and universities who train teachers to offer more intensive courses in the management of the exceptional child.

B. THE CHILD WHO MUST ATTEND SPECIAL CLASSES

The 5 percent of children who must attend special classes do not require classes for epileptics only, but profit more by mixing with children with all types of handicaps. These children, however, are subject to the same prejudices which hamper the children who attend regular school.

Reports from school officials indicate that the demand for special instruction far exceeds the availability of classroom space and trained teachers. Consequently, many children do not have the benefit of special classes. Thus, many educable children become public charges rather than self-sufficient, economically productive citizens.

The following suggestions are respectfully submitted for your

consideration:

1. Make funds available to local school committees for the establishment of special classes for handicapped children;

2. Provide transportation to and from school for these children;3. Develop standards to guide school officials in placing children in

special classes;
4. Offer fellowships to teachers who wish to specialize in the man-

agement of exceptional children.

C. THE CHILD WHO REQUIRES A HOME TEACHER

Epilepsy is not a static disability, nor one which worsens with age. Happily, seizures normally diminish with age. Thus, a child who, at beginning school age of 6, has frequent seizures, may very often have only occasional attacks at the age of 10.

Therefore, the young child who is able to learn, but who cannot attend school, should be given home tutoring so that he may be pre-

pared to resume his education later.

Although many communities provide a home teaching program, it is usually inadequate because of a shortage of properly trained teachers.

The following suggestions are respectfully made for your considera-

1. Offer fellowships to teachers with specialization for home teaching;

2. Offer Federal grants to school systems for the expansion of home

teaching programs;

3. Make funds available for the exploration of TV as a home teach-

ing tool.

Others will have spoken to you, I am sure, about the problems of the epileptic seeking employment. Í ask only that you keep in mind one basic fact. It is fact beyond all conjecture that the reasons epileptics do not find employment easily is not because of their disorder, but because of other factors, such as lack of training, social attitudes, et cetera. Is it not reasonable to presume that one substantial factor is that the majority have not benefited from a suitable education? Epileptics are intelligent.

If we give them half a chance to get a normal education, they can become employed and economically self-sufficient. If we do not, they

become public charges and nonprofit citizens.

Thank you.

Mr. Giaimo. Thank you, Mrs. Grass.

Mr. Wainwright. What other organizations participate in the care

of epileptics, your voluntary organizations?

Mrs. Grass. I speak for the American Epilepsy Federation, which is a national organization of some 23 volunteer local organizations throughout the United States. There is no other similar organization which will not ultimately become a part of this federation. There are several which have not as yet joined.

But other than this organization, there are only organizations for

professional assistance to the epileptic.

Mr. Giaimo. Thank you, Mrs. Grass.

The next witness will be Dr. Wilbert Pronovost, professor, department of education, Boston University.

You may proceed as you wish.

STATEMENT OF WILBERT PRONOVOST, PROFESSOR, DEPARTMENT OF EDUCATION, BOSTON UNIVERSITY

Mr. Pronovost. Thank you very much. It certainly is a privilege to be able to appear before the committee and testify, especially to the House Joint Resolution 494 and all the other bills that are associated with it.

Boston University trains speech pathologists, audiologists, and teachers of the deaf-blind. It also provides a center for diagnostic and remedial services for children and adults with speech and hearing disabilities, and provides consultant services to public and parochial schools and rehabilitation centers.

Through our services and surveys, we can substantiate that the national estimate of 5 percent of the school population as handicapped by speech and hearing disabilities applies to the New England

area. Individual schools vary between 3.8 and 6.5 percent.

In terms of the need for speech pathologists, we could have placed three times as many in New England as we actually trained. Vacancies now exist in all six New England States, which could not be filled by the anticipated number of 1960 graduates.

The 5 or 6 New England training centers will graduate only 50 persons for the estimated 250 vacancies which are expected in the

1960–61 school year.

Graduate fellowships are needed to encourage more individuals to enroll for training in speech pathology and audiology. The intensive specialized training at the graduate level requires additional expenditures which most students cannot afford after 4 years of graduate study.

Three-quarters of Boston University's present group of fulltime graduate students are receiving some form of financial aid from assist-

antships or fellowships.

Grants in aid are necessary to help a training center defray the costs of a training program which must include considerable indi-

vidual supervision.

For example, the cost of adequate supervision of clinical practice at Boston University would be at least \$500 per student per year, exclusive of physical facilities. This is half of the total tuition paid by the student, although the clinical practice is only one-fifth of his academic program.

I submit in a private institution that has no endowment this takes some pretty fancy budgetary figuring to see how you are going to pay

for it.

Obviously, we do need outside support for that. This cost does not include physical facilities at all. This is just staff, faculty, time.

The study group in speech and hearing which met at Yale during the 2 days prior to these hearings have reported that 1.027 speech pathologists and audiologists are needed in New England, with only 200 currently employed. In order to assume its share of responsibility, in expanding training facilities, Boston University would need to increase its present staff by at least 50 percent.

Mr. Elliott. How many teachers are you graduating now?

Mr. Pronovost. This year we will graduate 18, only 9 of which we feel reasonably sure will be available to us in New England. Some of them will go on to further graduate studies. Some of them will go into other areas.

Mr. Elliott. Your need each year on a yearly basis is what?

Mr. Provonost. For New England alone at least three times that many that we could fill, taking into account our share.

Actually, our students, in terms of nationwide placement, have about

10 jobs for every student at the present time.

Mr. Elliott. That is true of New England with that 1,000 backlog? Mr. Provonost. Yes. In connection with another aspect of the bill dealing with teachers of the deaf, in 1956 a survey, conducted by the United Community Services, in Metropolitan Boston, recommended that a training center for teachers of the deaf be established in the Boston area. Boston University could expand its present program to implement this recommendation, but grants in aid to help defray expenses, and scholarships to encourage students to enroll in the program, would be required.

In light of the factors presented above, this statement supports the provisions of House Joint Resolutions 494 and 316 and urges action

by the 86th Congress to meet an immediate need.

Thank you for the privilege of appearing. Mr. Giaimo. Are there any questions?

Mr. Wainwright. What is the title of your department?

Mr. Provonost. The speech and hearing section of the Department of Special Education at Boston University.

Mr. Wainwright. Do major institutions of learning, major uni-

versities, have similar departments?

Mr. Provonost. Yes. I don't know the exact number.

Mr. Wainwright. Under one title, or another, but performing the same function?

Mr. Provonosr. Yes, under one title or another all of the major universities and most of the small colleges have such departments.

For instance, we have at least 30 to 35 that are providing doctorate degrees study in speech pathology and audiology at the graduate level and others at a less advanced level through the master's degree.

Mr. Wainwright. You point out the difficulty that they have and you have in raising funds for the continuance of the program during the course. Where do they get their money from, from State grants if they do not get them from Federal grants?

Mr. Provonost. May I point out on a nationwide scale there are a lot of State universities involved in these programs and they, of course, have State funds for this provision, appropriations by the State legis-

latures to the colleges.

Mr. Wainwright. How about Boston University? Does it get any

help from the State of Massachusetts?

Mr. Provonost. No, we get no help at all. We are a private institution. This year we have some support for one small part of our program for the rehabilitation area of speech pathology and audiology from OVR. We have an OVR grant this year for a small part of our program.

Mr. Wainwright. Even under the guise of research or social wel-

fare no contribution can be made to the studies?

Mr. Provonost. Contributions could be made, but we don't have any source that we can tap.

Mr. Giaimo. Thank you, Doctor.

The next witness is Janet Swebilius, executive director of the Association for Retarded Children in Greater New Haven.

Mrs. Swebilius, may I say, as a fellow member and resident of New Haven, it is a pleasure to have you with us today.

We recognize your great interest in this field for many years. We are glad to have you and you may proceed in your own way. STATEMENT OF JANET SWEBILIUS, EXECUTIVE DIRECTOR, ASSOCIATION FOR RETARDED CHILDREN IN GREATER NEW HAVEN, CONN.

Mrs. Swebilius. I just want to say I am director of the New Haven association, but I am also representing the State association.

We all want to thank you for coming here and looking into it.

Other speakers have mentioned the splendid bills that were passed at the last session of the Connecticut Assembly. These cover not only mandatory education and institutional charges, but the one of which we are most proud, the establishment of an office of mental retardation in the State department of health, which includes, most important of all, appropriations for diagnostic clinics, vocational rehabilitation centers and day care centers.

I would like to touch on some of these individually later on, but one purpose in mentioning these accomplishments at this time is that we feel there is a definite need for greater effort on the part of the Federal Government in coordinating and disseminating the information gained in various sections of the country in these fields.

As proud as we are of our legislative accomplisments in Connecti-

cut, we realize that they are creating and will create problems.

The Mandatory Education Act, for instance, means a very severe teacher shortage in 1961 for the mentally retarded. Even though we are training more teachers for special education in Connecticut colleges than in any other section of the country we understand that there will be a shortage of 150 special teachers in this State in the next 2 years.

We feel that the Federal Government can assist in this respect by

further strengthening of Public Law 85-926.

Further, in the area of diagnostic clinics the problem of adequate and appropriate staff is acute as is also the problem as to where such clinics should be located for the greatest service to the greatest number.

Even when adequate and appropriate clinics are established a serious problem exists in locating the mentally retarded at an early

enough age to plan and counsel properly.

A good example of this is our own preschool class. Fifty-four percent of our children come from the outlying towns whose population is only 40 percent that of New Haven.

And we know that New Haven is not singularly blessed by not having retarded children. We just do not know who or where most

of them are until they reach school age.

Here, again, we think the Federal Government can help toward proper education or perhaps the public health nurse who in many

cases is the most important contact for the family.

With the finding of the mentally retarded as early as possible, families could be directed to the various day care centers and preschool training programs. From our own experience we know that the earlier we get the child for training the more likely it will be that he will adjust in the public school classes.

This, in turn, makes life easier and better for the child, the family,

and the community.

For vocational rehabilitation centers we heartily endorse the passage of H.R. 6485, introduced by the Honorable Carl Elliott. We would hope that the intent will be clarified and that the severely retarded will

be definitely included for rehabilitation.

There is a straight line to be drawn from early diagnosis through preschool training, special education, and recreation to vocational rehabilitation and job placement in either the community or in a sheltered workshop condition. We feel that there is an obligation of each agency of the Government to provide to the mentally retarded those services which are normally provided the average child as well as those which might be provided because of the condition of retardation.

With a continuing enlarged Federal participation and coordination the mentally retarded will become a national asset instead of an

economic and social liability.

Thank you.

Mr. Giaimo. Are there any questions by members of the subcommittee?

Thank you, Mrs. Swebilius.

Mrs. Swebilius. Thank you, sir.

Mr. Giaimo. The next witness will be Dr. Charles D. Marple, director of the Allergy Foundation of America.

STATEMENT OF CHARLES D. MARPLE, DIRECTOR, ALLERGY FOUNDATION OF AMERICA

Dr. Marple. I have no prepared statement.

Mr. Giaimo. Did you wish to send us some prepared material?

Dr. Marple. Yes.

Mr. Giaimo. Do you wish to incorporate it in the record?

Dr. Marple. Not at this time.

I am appearing here to bring to your attention a special group and will confine my remarks actually to two special groups within the entire field of allergic individuals. One group is the allergic children who suffer particularly from severe and intractable asthma, and the other is allergic adults with occupational or nonoccupational allergies whose abilities to earn an adequate living is either prevented or impaired by the disease.

Our organization, which is a national voluntary health agency of rather short duration, 5 years in all, has made a considerable effort to tackle these problems from the simplest to the most complex aspects, from statistics, determination of where facilities exist, to rehabilitation, and we find it exceedingly difficult to find information with which we can provide help, assistance, or even advice to these individuals.

It has apparently been the feeling in the past that allergy, including asthma, is not of very great consequence. There are very few statistics, very little information, and practically no special facilities for the

care of these people.

It is now generally accepted, using Public Health figures, that at least 10 percent of our general population suffers from some sort of allergic condition.

A recent study which will be published next month by Dr. Robert Rapaport, of New York City, shows that in the average pediatric

practice about 20 percent of the children suffer from such allergies. If these children can be treated properly, if they recover from their disease they can become perfectly normal, self-sufficient adults.

As a matter of fact, they tend to have normal intellect and there have been some studies to show that they may tend to have superior

intellects.

However, the general belief that they spontaneously recover from this type of disease is entirely erroneous. A very large percentage who are not treated or not treated properly become chronic asthmatics for the rest of their lives. These people suffer not only the physical detriment of asthma or the other allergic conditions, but they have a very severe emotional overlay.

The emotional health of the individual is impaired and the emotional life of the family is very much disturbed. This becomes a vicious cycle. You find more and more that these asthmatic children are disturbing to the family, pretty soon the children realize, subconsciously perhaps, that they can avoid all the difficulties in life by having their attacks, and we find that emotional episodes in the home will provoke these attacks.

The tragedy of all this is that this can be taken care of and prevented by good medical care, psychiatric or psychological evaluation

and care and proper rehabilitation.

There are very few places where these people can go for this care unless they are fully able to afford the cost of private medical practice, including specialists in allergy, perhaps psychiatric care and

so forth.

We have made some survey or attempted to survey the clinical facilities open to these people throughout the country. The reporting is not very good, but it is very tragic to see in how many areas in the country we could find no evidence of any clinic which gave the special care necessary to these children.

In one large city in New York State, one hospital answered our inquiry by writing on the back of the letter "We wish you could find a trained and skilled allergist to send to our city because we don't

have one."

With the adults there is a problem which is, I think, no less important. In many industries the occupational hazards and in others the individual hazard of outside allergy, men are prevented from earning a proper living because of their allergy.

With the white collar class very often the plant or industry or the

business will operate a clinic to take care of them.

With the unskilled laborer he may be able to go to an environment

where he is not exposed to whatever he is sensitive to.

For the skilled or semiskilled laborer he very often has to drop to a lower economic plane in order to avoid the sensitivities which manifest themselves in asthma, skin dermatitis, and that sort of thing.

There are at least 3 to 4 million people in the United States with There are probably an equal number with other allergies which are sufficiently important to interfere with normal education and normal work.

At the present time the problem is not only a national one, but it is a basic one because there are no case finding records as far as we know. Except in private medical care there are very few places where these people can get total care.

There are very few special educational training programs for them. The number of institutions which give these people long range care with psychiatric aspects, vocational rehabilitation and that sort of thing, there are only about four in the country.

Most of the private hospitals will not willingly take asthmatic patients because they tend to be long range and they very often are

not critically ill over that period of time.

The goals that are needed here are to start from scratch. First of all, we need more physicians interested in, trained in, and skilled in the treatment of allergic individuals. We need more special clinics and we need more hospital beds available for these people so that they will be treated in an environment conducive to their complete re-

We need special institutions where the intractible asthmatic may be treated away from the home environment which in the case of children is very often very detrimental because of the emotional con-

flicts.

We need special educational programs.

So far as I know, these are practically nonexistent. To our knowledge, although we have many inquiries about this, I know of only one summer camp in the United States where they take special care of asthmatic children. There are some others which take asthmatic children along with other children, but only one where we can recom-

mend these children to for their special care.

In the matter of rehabilitation I think there should be a nation wide program in which, so far as I can see, only the Government can take leadership. There is not a sufficient interest in these conditions for private leadership and the matter is now broken up into a number of organizations that are trying to do a job which do not have the national strength unless the Government does give the leadership.

Mr. Giaimo. Doctor, you stated there was a need for more physi-

cians trained in the field of allergy.

Dr. Marple. Yes.
Mr. Giaimo. What do you propose as a solution to that?

Dr. Marple. I don't know any solution other than by exposure. What we are trying to do in our foundation, we have two programs which we think will attract men. I don't think you can browbeat or

force them into a specialty.

The thing to do is to expose them to it and make it attractive. Along with certain other organizations we are offering medical students summer scholarships during which they spend their summers working in research and doing clinical experience in allergy.

We hope this year to support 30 such students. A great many of these students do acquire a considerable interest in the field. They will not all become allergists, but they will become better doctors.

We also have postdoctoral fellowships which are available to

persons already qualified in pediatrics and internal medicine.

We have only been able to award three of these so far. Our first postdoctoral fellowship will become the first full time instructor in pediatric allergy in Johns Hopkins where they are setting up their first clinic for pediatric allergy so they can continue research, teaching students and house staff in residence.

This is what we think is one of the basic needs. We need a lot more of these fellowships and scholarships.

Mr. Giaimo. Are there any questions by members of the subcom-

 $\operatorname{mittee} ?$

Thank you for your testimony.
Our next witness is Dr. Hutcheson.

Dr. Klebanoff. I am not Dr. Hutcheson.

Mr. Giaimo. Dr. Lewis B. Klebanoff will testify in place of Dr. B. R. Hutcheson, who addresses this letter to Carl Elliott:

Lewis B. Klebanoff, Ph. D., S.M. Hyg., is supervisor of the Preschool Nurseries for Retarded Children which are run by the Department of Mental Health, Commonwealth of Massachusetts. In my absence, I would like Dr. Klebanoff to read our joint statement about the evident needs for special education as they relate to the handicapped child. Dr. Klebanoff is fully authorized by me to answer any questions you may have about our statement.

Sincerely yours,

B. R. HUTCHESON, M.D., Director.

Mr. Giaimo. Without objection by members of the subcommittee, we will listen to the testimony of Dr. Klebanoff.

STATEMENT OF LEWIS B. KLEBANOFF, PH. D., S.M. HYG, SUPERVISOR OF COMMUNITY MENTAL RETARDATION CENTERS, DIVISION OF MENTAL HYGIENE, MASSACHUSETTS DEPARTMENT OF MENTAL HEALTH

Dr. Klebanoff. Mr. Chairman and members of the committee, the fact that your committee is soliciting testimony about the problems of special education and rehabilitation reflects the great interest and concern of our citizens for the needs of the handicapped child.

Of this group of unfortunate children, by far the largest number are mentally retared and/or emotionally troubled. By and large it is these groups of children for whom the least extensive and least adequate services are provided despite the tremendous number of

families in great need of help.

We support the general expansion of programs and services for all handicapped children, particularly the mentally handicapped. It is an historical fact and one of the hallmarks of this Nation's progress as a world leader in demonstrating what a democratic society can do for its afflicted citizens that the wisdom, foresight, and generosity of previous Congresses have not only stimulated, through various grants-in-aid, matching funds, research funds, and other projects, but actually made possible the beginnings of a great number of vitally needed programs and services.

However, in a dynamic, growing, help-thy-neighbor society, such

as ours, much more is needed.

In the few minutes allowed us, we should like to present for your consideration two problems, the successful resolution of which will help to make more effective whatever legislation is adopted.

Problem No. 1 concerns the earmarking of various funds to a par-

ticular agency of State government.

You may not be aware of the fact that in Massachusetts the Department of Mental Health has historically had the major responsibility for mental retardation. The Walter E. Fernald State School was

opened in 1848. Special education for the retarded in the Boston public schools began at the turn of the century and it was only in 1919 that statewide legislation was passed providing special classes for educable and trainable retardates under the supervision of the department of education and a special division was not created until 1954.

The department of mental health, nevertheless, currently operates about 100 classes for handicapped children. Despite the organization of our State government and our own internal apportioning of responsibility, various Federal programs do not possess sufficient flexi-

bility to adequately respond to our local needs.

To mention only two examples, various research funds of the Office of Education will be made available only to State departments of education or schools of education at colleges and universities and the Children's Bureau program for demonstration projects in mental retardation will apparently not consider any group other than a department of public health.

Briefly on this point, we are asking for legislation to be flexible enough to adapt to local laws and customs within the bounds of high purpose and quality and also to be broad enough to allow different

states to fill in the particular gaps in their own programs.

We do not mean to imply that the other departments are not doing a good job with these funds, but are merely requesting expanded

eligibility.

The second very important problem which we should like to bring to your attention is the very great need for depth and quality of programing. We have become concerned about the programs, for the retarded child particularly, which are undertaken with little or no understanding of the extremely vital importance of obtaining an adequate medical, psychological, and social diagnostic evaluation.

A comprehensive study of the child by an integrated team of physicians, psychologists, social workers, speech therapists, teachers, and others not only may uncover remediable defects, but can help to plan an educational program for the child by placing in proper perspec-tive not only his handicaps, but his strengths and potentials.

These considerations, of course, apply also to the emotionally dis-

turbed child.

Today, unfortunately, too many children have their educational and rehabilitative courses charted for them on the basis of very meager evidence obtained from a brief intelligence test or briefer interview by semitrained people who have not had the proper preparation for the jobs which they are doing.

What if the law allowed your child to have his tonsils removed by someone who had read all of the books and taken all of the courses, but who had never observed, let alone performed, a tonsillectomy.

Unhappily, many of these crash programs to make psychologists, social workers, or guidance workers out of teachers who take courses evenings or summers fall into the same category. There is no provision made for supervised field experience under a fully qualified senior worker.

We feel that these provisions are lacking in brief training programs essentially because the statutes do not insist that they be provided.

Public health law, on the other hand, attempts to protect the citizenry from adulterant chemicals in food, inadequate strengths of medicines, and in some programs insists on its money only being used for personnel serving within the provisions of merit systems which set professional standards. Thus, there is legal precedent for this approach.

Having a flair for working with children is a necessary but not sufficient condition for being a professional, just as the good will and motivation for helping the handicapped is not sufficient to guarantee sound legislation, but requires, in addition, a careful evaluation of the needs of a particular group and the resources available to meet those

needs.

Let us not loose upon the community people from whom the public will expect, because of their titles, services which they are woefully inadequate to perform. Such workers, however well intentioned, frequently cause a great amount of harm to families when they over-

reach their limitations.

It is clear that, at least for the foreseeable future, our demands for trained personnel are going to outstrip the supply. Expanded training funds for universities, hospitals, and clinics are needed, as well as training stipends to encourage our able college students to accept the time-consuming, rigorous discipline of full professional preparation.

Where it is necessary to utilize less than fully trained personnel, we urge that legislation specify that these persons work in a setting

in which they are supervised by a fully trained professional.

In this way, we will be better able to deal with the great demand for personnel while protecting the public whom we are serving.

In summary, we need more and better programs to serve the handicapped, comprehensive programs that provide for a continuity of services based on adequate diagnostic studies with therapeutic and educational prescriptions.

We need Federal funds to be more flexible in order to adequately meet the needs of the various States and we need your help in protecting the public from a flood of semiprofessionals with inadequate

training.

We should like to leave with you for your subsequent consideration a summary of proceedings of the Governor's Conference on Mental Retardation called by his Excellency, Gov. Foster Furcolo, of Massachusetts, on May 26–28, 1959. This conference was a big stride forward for our Commonwealth and was made possible by a grant from the Community Services Branch of the National Institute of Mental Health.

Thank you for your courteous attention and the opportunity to

address you.

Mr. Giaimo. Thank you, Dr. Klebanoff.

Are there any questions by members of the subcommittee. Thank you very much for your presentation, Dr. Klebanoff.

Without objection, the summary of the proceedings of the Governor's Conference on Mental Retardation will be made a part of the record

(The summary referred to follows:)

SUMMARY OF PROCEEDINGS, GOVERNOR'S CONFERENCE ON MENTAL RETARDATION, NEW OCEAN HOUSE, SWAMPSCOTT, MASS., MAY 26–28, 1959

SOME PERSPECTIVES ON THE CARE OF THE RETARDED CHILD

(By E. N. Rexford, M.D.)

A Governor's Conference on Mental Retardation, which brings together citizens, governmental officials and professional persons, gives appropriate recognition to the fact that our resources today are mobilized with a renewed concentration

upon the needs and problems of the retarded child.

That the Governor of Massachusetts calls such a conference is a peculiarly fitting circumstance in view of the great contributions which Massachusetts citizens, with the frequent cooperation of the legislature of the Commonwealth, made to the early measures for study, training, and care of mentally defective children. You may not all be aware of the fact that these efforts on behalf of retarded children were practically the only psychiatric efforts with children from about 1846–1909. The stimulus for such work came from the reports of French psychiatrists, Itard, his pupil, Edward Seguin, and others who were experimenting with services for mentally defective children.

In 1846, an experimental school for mentally defective children was established by an act of the Massachusetts Legislature at Perkins Institute for the Blind, under the supervision of Dr. Samuel G. Howe. In 1848, Seguin came from Paris to take over the superintendency of the school which was then incorporated as the Massachusetts School for Idiotic and Feebleminded Children. It was later renamed for Dr. Walter E. Fernald, its superintendent from 1887 to 1924. Dr. Harvey Wilbur of Barre, Mass., was another pioneer who in 1848

took into his home for training a retarded boy.

These and the measures later developed in other States operated with the primary aim of filling in gaps in the educational system, yet, interestingly enough, all of these pioneering schools and projects were headed by physicians. The education of defective individuals was seen only in terms of institutional training and, in France, this focus persists very much to the present day.

In the United States, however, developments took place along several lines: the setting up of colonies, boarding homes, parole and supervision programs, recognition of and separation out of the delinquent defective group, provision for special classes in the public schools, courses of training for special teachers, etc. In each of these developments, Dr. Fernald played a central role in pressing for the support of such activities from the various legislatures, the medical profession, the educators, and the lay public.

Incidental to these interests, Dr. Fernald extended to many other types of children the benefits of psychiatric understanding and approach. The years 1893–1909 saw the first sustained approach of actual and scientific study of children as such. G. Stanley Hall, of Clark University, and Adolph Meyer, of Baltimore, were influential in setting up the National Association for the Study

of Children.

The era of the child-guidance clinic began specifically with Dr. William Healy, who in 1908 wrote of his travels about the United States: "With the exception of Witmer in Philadelphia and Goddard at Vineland, there was not even the semblance of anything that could be called a well-rounded study of a young human individual. Even physiological norms were not available; standardized mental tests had yet to be developed; the importance of knowledge of family attitudes and conditioning was barely realized." The child-guidance movement involved multidisciplined study and treatment of children with a wide variety of emotional and behavior difficulties—first, particularly the delinquent; then, later, the neurotic; and, more recently, the psychotic child. In these programs the retarded children have been included, but not in large numbers; the early training and educational programs for them have continued in parallel development.

I have spent some time outlining the historical developments, not only because I wished to put before you various interesting facts and, incidentally, give all of us a certain chauvinistic gratification, but because I believe that historical perspective can help us see more clearly where we are today and where we need to look for tomorrow's efforts.

Our American society has been characterized by both native and foreign observers as unique among Western groups in our concentration upon the welfare of our children, in the expected paticipation of specialists, government officials, and lay citizens in programs of child care, and in our demand that any need for children, widely perceived and strongly voiced, be met speedily and effectively. As one born and reared in this country, I naturally partake readily of our expectations, hopes, and collaborative efforts. As a child psychiatrist of some years' experience, I am acutely aware of certain realities which can and do impinge upon the accomplishments of specific tasks our society or groups within it demand of our governmental agencies and of our professional personnel.

I noted for you the date of Dr. Healy's survey of services for children, 1908, just 51 years ago. During this half century, we have made significant strides in our understanding of children, of family life, of disturbances in expectable development, and concomitantly in our knowledge of useful services for children. Over the past 10 years, leaders in the field of child psychiatry and the related professional groups as well have been facing the fact that we have been applying what we have known, but lagging behind in developing new knowledge of human behavior. Many of the children who come to our clinics, and others whom someone wishes to refer, for example, are not effectively understood or treated on the basis of our present knowledge. This unhappy reality applies, for instance, to many delinquent children, psychotic boys and girls, and to many retarded children. It is natural for those concerned with the problems of delinquency, psychosis, retardation, and other serious social and emotional ills of children to decide that more services of the kind we have will provide the solutions they seek. It is true, I believe, that some progress can be made by expansion of all children's services; such expansion will require large sums of money for training new personnel and for maintaining the expensive highly specialized services involved. Whether as a nation we are ready to face the need for heavier taxation and for increased private giving, I do not know. What I am convinced of, from my experience in three Boston child psychiatric clinics, is that our present professional resources cannot be stretched much further.

Of even more significance is the concept of the crucial necessity for careful systematic research in the areas of child and family life which we too little understand today and the subsequent development of methods and techniques based upon that new knowledge which can provide us with new and improved tools for service, for guidance, and for program planning. Nowhere is this reality more apparent than in the field of mental retardation.

A child psychiatrist is often told by those specializing in work with retarded children that his experience is too limited to be of much value as a contribution to broad programs for such children. It is true that we see a relatively small number and perhaps a special group in our clinics and private practice. I found it interesting and encouraging that, having written down last week the points I wished to make to you tonight, I found myself in good company over the week-end as I perused the new survey by Masland, Sarason, and Gladwin called "Mental Subnormality, Biological, Psychological, and Cultural Factors." We were in agreement, I found, in the impression that we do not know many of the most basic facts involved in the etiology (the causes) development, the groupings, and the management of children who are intellectually handicapped. Many of the beliefs, both privately held and publicly expressed, regarding the retarded child are based on nothing more scientific than folklore, prejudice, or anxiety.

Research in the field of mental retardation must be approached from a variety of angles and must involve the participation of persons from many specialities. The role of central nervous system damage, which is Dr. Masland's special area of interest, cannot be well understood without basic studies in pregnancy, embryology, early infancy infectious disease, and immunology in childhood, which are not presently available to us. My own work with children who have learning difficulties salted by an old interest in and much ignorance of child neurology long ago persuaded me of the importance of our building a solid floor of knowledge about this area, the so-called organic factors in retarded learning processes.

Drs. Sarason and Gladwin write particularly of the work which has been done regarding the psychological and cultural factors in mental subnormality and document brilliantly the flimsy base upon which so many programs and services have been built. They raise trenchantly the question, "What is the nature and structure of intelligence?" and illustrate from the literature how confused and unsatisfactory our understanding is of this "faculty." What psychological tests test and what they do not, whether normal expectable functioning in the school or test situation is a valid ground for predicting functioning in the outside world or in adult life situations—these are basic questions for our everyday work with retarded children. The influence of social and cultural factors upon the picture of retardation we see in the child and upon our planning for him we know far too little about.

With the specific suggestions for research areas of these authors I am in full agreement, but even more important, I believe, is their recommendation for research groups set up in conjunction with large university and medical school research institutes to stimulate the studies of many specialists using a wide variety of techniques which can be integrated to provide us with an everbroadened body of knowledge regarding many facets of the problem of mental retardation.

The investment of time and money required for such endeavors will be large; most of the funds must undoubtedly come from governmental sources.

Closely related to the development of such research groups is the suggestion for training key personnel to work with retarded children in settings which can profit by the scientific, multidiscipline approach to the problem. Such a master plan would, I believe, serve as an important stimulus to recruitment of talented, skilled personnel for the study and care of retarded children, at present a difficult problem in itself.

The need for special training of the nursery school teacher, the public school teacher, the social worker, the psychologist, the psychiatrist, who are going to work with retarded children is a very important reality which must not be overlooked in setting up services and expanding others. If we are to provide the opportunity for each American child to be educated according to his need and capacity, Dr. Fernald's goal, we cannot ignore the fact that while some people's interest, native sympathy and professional skills may indeed contribute to the child's progress and general welfare, the addition of understanding of the retarded child's particular problems and needs will obviously increase the effectiveness of the professional effort on the child's behalf.

In closing, I would like to emphasize a fact so obvious that my comment may sound banal, namely, that retarded children are first and foremost, children. This means that they have the basic needs of all children for a warm, reasonably consistent and supportive family life. It means that we must understand that with this child as with a child intellectually normal each parent interacts according to the parent's own personality and maturity, influenced by the meaning this child has for him. When a child is handicapped in whatever fashion, different problems of adaptation for parents and child are added to those already intricate and demanding in any parent—child relationship. This is the area in which the psychiatrist is particularly at home; he has ocassion daily to ponder the mysteries of the bearing emotional relationships have upon learning.

This is an area little explored in the Masland-Sarason-Gladwin survey, an admittedly difficult area for systematic research. Without more understanding of it, I believe we will handicap our efforts over and over again. If professional and parents' groups concentrate upon services for the retarded child which leave out this area of parent-child relationships, we may lose one of our most vital sources of understanding and therapeutic advance. Our conference is entitled "The Governor's Conference on Mental Retardation." The excellent survey to which I have referred is entitled "Mental Subnormality." Let us not in our serious efforts together on his behalf forget that the boy or girl we wish to help is a child, a retarded and handicapped child, but first and foremost, a child.

THE RETARDED CHILD AND THE COMMUNITY—A NATIONAL VIEW 1

(By Martha M. Eliot, M.D., professor of maternal and child health, Harvard School of Public Health)

During the past decade there has been a great upsurge throughout our country in citizen interest to find ways of providing more adequate community facilities and services for mentally retarded children. This interest is increasingly centered on the young child, even the newborn infant, for it is in this period of life that the diagnosis should be made, if possible. Federal, State, and local gov-

 $^{^1\,\}mathrm{An}$ address given at the Governor's Conference on Mental Retardation at Swampscott, Mass., May 26, 1959.

ernments and many private organizations of professional and citizens' groups are deeply committed to learning about causes of mental retardation through research, to the provision of improved health, educational and welfare services for these children, and to the process of training personnel in many professional fields.

Local diagnostic facilities are being established under various auspices: some with State and local funds either those of health departments or mental health agencies; some with funds made available through the Children's Bureau in connection with the maternal and child health services of State and local public health agencies; some by private organizations, especially parents' organizations, and through private mental health clinic facilities. Special nursery schools are being developed. Physicians, public health nurses, child welfare workers, and teachers of young children are discovering that there is a great deal that can be done to help parents understand their children, learn how educable children can be taught, how trainable children can be given the help they need to learn to care for themselves.

In many institutions and training schools for mentally retarded children a new look at services and facilities is being taken in order to make available those required for more adequate care and education and to provide for the hospital type care needed by the most seriously handicapped.

Much community action has been initiated by the National and State associations of parents (of retarded children), such as the Massachusetts Association for Retarded Children. For more than a decade these associations have been working indefatigably to obtain national and local, public and private funds to accomplish their objectives.

It is of real significance that the parents of mentally retarded children, who banded themselves together in the National Association for Retarded Children, established, as one of their early acts, a committee of experts and scientists to explore the need for basic research and to seek funds to support research. The work of this committee under the leadership of Dr. Grover Powers of Connecticut has been very important, indeed, for it has been instrumental in stimulating many scientists to carry on research in this field of mental defect and in helping to find funds for this purpose.

In 20 States there are now official commissions established within recent years by a State legislature or Governor to consider State responsibility toward the mentally retarded and to recommend legislative and administrative changes at the State government level. Massachusetts is one of these.

It is about this nationwide interest in what the States and communities, the citizens, and professional and nonprofessional organizations are doing that I want to speak, especially the community aspects of work in behalf of your children. Though interest, activities, and financial support have been growing rapidly on a national as well as a State and local basis, the responsibility for the direct services to assist parents with their problems has always been assumed by statewide or local agencies. Likewise, research and training of personnel in this field, as in many others, are matters that greatly concern universities, official and private agencies, and research institutes at the local level. The role of the Federal Government is principally to take an overview of the total problem, to provide technical and financial assistance, to coordinate investigators and program planners, and to open channels for the exchange of information thus new knowledge of scientific facts and of methodology for the operation of programs may be made widely available. Within the framework of National, State, and local government, and private agencies and organizations at all levels, there is, indeed, a new and vigorous trend toward improving the care of mentally retarded children.

What are some of the facts that underlie this need to make local resources available and to stimulate research and training?

I would like to look first at the size of the problem.

It is commonly reported that about 30 out of every 1,000 of the total population (3 percent) are mentally retarded. This means a total of some 5 million persons of all ages. From this we can estimate that there are probably about 1¾ million retarded children under 18 years of age. Of these it is variously estimated that about 75 to 85 percent fall into the group described as educable, about 15 to 20 percent into the group described as trainable, and only about 3.5 to 5 percent into the group of severely retarded.

Within this average figure of 30 per 1,000 for the total population, there is, however, a wide variation in the number of children who are found to be retarded at different ages. For example, one study of the prevalence of retardation in different age groups showed a suspected rate of 4 per 1,000 among the 1- to 2-year olds. For the 3- to 4-year-old children a rate of 6 per 1,000 was found; for the 5-year olds, 22 per 1,000; for the 6-year olds, 40 per 1,000; and for the 10- to 15-year-old group, 80 per 1,000. Clearly, this apparent increase in rate is only a reflection of our inability to discover at the earlier ages the evidence of the relatively large number of mildly or even moderately retarded children which begins to show up when the children go to school.

To some of us it may be surprising to learn that only about 159,000 mentally retarded persons are in institutions and training schools. This figure is an estimate only and includes persons of all ages. Individuals in institutions represent about 25 percent of the seriously defective, about 15 percent of the moderately retarded, and only 1 percent of the large group of those who are slightly retarded. The number of children under 18 years of age in these institutions is not available, but we know that it must represent a very small

proportion of the total number of retarded children.

It seems to be generally agreed that institutions should be given the responsibility for the care of three types of person, "the severely retarded who are totally dependent, the less retarded who are unable to integrate into society because of emotional disturbances leading to antisocial and delinquent behavior, and a third group, the older adult retarded who are dependent because their families * * * can no longer care for them." Included within the first category are infants and children who are bedridden and wholly dependent on others for

their care. For such the States must provide hospital-type care.

It is not always easy to decide when a child needs to have institutional care. In the past, no doubt, too many children have been placed in training schools and institutions when they might have been cared for at home. Thanks to the initiative of the many local groups of parents, and of their National Organization for Retarded Children, more and more people in authoritative places are becoming aware that many mentally retarded children can develop more successfully if they live at home in the family circle with its warmth of human affection than if they are removed to institutional care. Actually more than 95 percent of mentally retarded children do live at home. This means that heavy responsibility rests on State and local, public and private agencies, and on individuals who care, to see that community resources are made available to help parents understand their problems and give the necessary care and training to their children.

When society faces a problem that is as vast and as widespread as is mental retardation, it is obvious that we must look for ways to break it down into manageable units of activity by determining groups within the total that are at greatest risk and that can be singled out for specific attention; by developing special services for early case finding, diagnosis, evaluation, and followup; and by pressing forward with research that will sooner or later produce the knowledge necessary for prevention, with programs of training for all types of personnel who work with parents and children alike, and with ways of informing the public generally as to the nature and scope of the problem and society's responsibility to help in its solution.

It is not necessary to discuss here the paucity of our knowledge of the causes of mental retardation, or to urge you to support research that will throw light on causation or on ways to improve methods of diagnosis, treatment, education, training, and care of retarded children. Nor do I need to urge you to take continuing interest in research that will result in improved patterns of community organization of the multiprofessional services and facilities required for ade-

quate care for these children.

Many, though still not enough, basic studies in the fields of medical research and genetics are in process in universities or research institutions. The National Institutes of Health, in addition to their training grants, are supporting research on the basic etiological factors in mental retardation and allied disorders, such as cerebral palsy. These studies range from many individual investigations of metabolic processes to that very comprehensive, 5-year col-

² "New Directions for Mentally Retarded Children—A Report of a Conference," published by the Josiah Macy. Jr., Foundation, New York, p. 101.
³ Garrison. Mortimer, Jr., "Research Trends in Mental Deficiency." Children, January-February 1959.

laborative study (in 15 medical centers) of cerebral palsy and other neurological and sensory disorders of infancy and childhood now going on.

Clinical and operational studies may be expected to develop before long in connection with the evaluation and treatment clinics for young retarded children that are supported, at least in part, by Children's Bureau funds. The Office of Education has contracted with various educational institutions for research in six areas: (1) the definition and identification of the mentally retarded; (2) learning characteristics and responses; (3) language and communication difficulties; (4) teaching methods and procedures; (5) the effects of different typesof school organization; and (6) postschool adjustment and other problems.

In the behavioral sciences new trends of research are appearing directed toward studies of special difficulties that may exist, such as the importance of psychogenic factors in inhibiting mental development (Woodward and coworkers), the process of abstraction (Griffith and Spitz), or the importance of specific handicaps of retarded children with visual or auditory perceptual difficulties (Hunt and Patterson). In addition, other investigators are evaluating the effects of socioeconomic condition, language barriers in school performance, and numerous other subjects that will throw light on what is missing in the learning, thinking, problem solving, personality, and socialization of the mentally retarded child.

In spite of the great impetus that has been given to research recently, the problems waiting to be solved that are related to prevention are so complex and so greatly involved in metabolic, genetic, and physical factors that it may require many years to determine with accuracy the many different factors that may be involved. It is not necessary, however, to await all the new knowledge that sooner or later will come along before we proceed with programs of training and care. Fortunately, we do have sufficient understanding of child development to evaluate the degree of retardation sufficiently well to allow us to get

on with our services for the retarded child and his family.

For example, we know that as a child develops in infancy and passes through his preschool years, certain stages of growth and development can be observed, and estimates may be made, in general, as to how well any particular child is doing. We know, moreover, that this growth and development process is not just physical or physiological. From early infancy on it involves the child's social and emotional behavior, his ability to perceive, and, a little later, his ability to begin to use his mind in the realm of ideas, form, creativity, and association. It is not too easy or simple to arrive at exact measurements of a child's mental and emotional development at any one point in these earliest years, or to understand when an emotional situation is getting in the way of a child's intellectual development and giving the effect of retardation. On the basis of a single observation it may be dangerous to predict what the future holds.

However, when a pre-school-age child is under the continuing observation of a good teacher in a nursery school, it may be possible to detect the first, slight evidences of slow learning. It may also be possible with an adequate diagnostic service to discover that some retardation is not the result of organic defects, but is emotional in origin and the result of some deviation from the usual pattern of personality development. Though slight variations from a so-called normal standard may be hard to detect and even harder to evaluate in the early years, it is, however, possible to reach broad judgments in the moderate or more severe types of retarded development. All of this and more is involved in the diagnosis of mental retardation in the young child.

That a child is put to a real test when he enters school and begins to work with symbols, ideas, and forms, such as letters and words and numbers, is well recognized. It soon becomes evident which children can learn unusually quickly and easily, which ones fall into the usual or "normal" group, and which ones are the slow learners. For many children, indeed, school is the first place where they can try out this intellectual process. This may be especially true for those who come from homes where study and reading or other forms of creative activity are not important in the family culture or not available for

various socioeconomic reasons.

The health supervision programs for so-called normal preschool children is perhaps the best casefinding device we have for this age group, not only for many different types of physical defects and handicapping conditions, but for mental defects. It also serves as an agency for the referral of such children to other clinics or to private physicians for followup care. Increasingly, physi-

cians and nurses who form the basic team in such child health services are paying attention to the mental, emotional, and social development of the childern, and, when some deviation is found or suspected the child and his parents are referred to whatever community resources exist to help with the particular problem. That there should be such special resources easily available to all communities is apparent to us all. However, unless the physician and nurse, hopefully with consultation from a social worker, are aware of these resources and understand the skills of referral, the special resources may not be utilized early.

The child health conference or the private practitioner's office may be the place where the parents of a mentally retarded child face the problem frankly for the first time. How the first discussions between doctor and parents go may speed the day when a program of good training and care is started for the child or it may result for the parents in the frustrating process of shopping around from one clinic or doctor to another in the vain search of a diagnosis they want to hear. Many times the responsibility for starting parents on a constructive program of help to their child rests with the child health services, be they in a public clinic or a private doctor's office. One of the best reasons I know why State and local health departments should develop good infant and preschool child health supervision programs in every community is this need to provide for any child the kind of help and care that each one requires for the best

possible start in life.

But neither the private physician nor the child health conference can successfully handle all kinds of problems alone. Just as the parents of a child who is thought to be deaf must be referred to a special clinic or to a specialist for diagnosis and followup care, so must the parents of a child who is suspected of being retarded be sent to a special clinic or to a group of specialists for diagnosis and followup care. Recent experience has shown quite clearly that the usual infant and preschool child health supervisory service needs to be supplemented with a specialized clinic for evaluation and diagnosis of those children who are suspected of being retarded and for continued special help needed by parents. If these special clinics are under the auspices of a local health department which operates well-child clinics for normal children, then there can be cooperation between the regular and special clinics, routine immunizations can be done, and the public health nursing staff will be available to work in special clinics and do home followup.

Interestingly enough, we have parents themselves to thank for pushing forward this type of specialized clinic service until, as I shall point out, it is now becoming

an important part of our State and national child program.

What was it that brought this about? Clearly the movement stemmed from the fact that parents of young moderately or severely retarded children were not getting the help they wanted from their doctors in the first place, or when they shopped around from one professional worker or group to another, in most cases they were still left alone with their problem of what to do after a diagnosis was made.

In many homes suspicion and often great anxiety that all was not well with a child's development had been aroused early, perhaps very early in the preschool years. From longtime habit such parents turned to the physician who had been giving the usual care to the child in sickness and in health. The results of such a consultation may or may not have been satisfactory to the parents, depending on a number of factors. These included the physician's own understanding of mental retardation, his skill in helping parents with the day-by-day process of training their child to help himself, and, lastly, his knowledge of what other resources there were in the community that could be used to give additional help to the parents. Unfortunately, few practicing physicians had had any training or much experience in this respect and few communities had any specific help to give them. This was where we were a decade ago. (Of course, over the years there have been a good many physicians, like Dr. John Thomson, of Edinburgh, who have had great interest and skill in helping these parents. But the great majority of doctors had little to offer because they have been taught so little in medical school.)

It was in 1949 in New York—so Hormuth reports —that the first group of parents of mentally retarded children determined to establish a special clinical facility where they and others could get the kind of help they wanted—a thorough

⁴ Hormuth, Rudolph P., M.S.W.: "Community Clinics for the Mentally Retarded." Children, September-October 1957, vol. 4, No. 5, p. 181.

diagnosis, interpretation of findings, and continuing guidance and management supervision. This was the kind of help they knew they could get if their child had, let us say, rheumatic fever or poliomyelitis. Why not for mental retardation? The clinic was an exploratory demonstration, and it succeeded. Five years later, in 1955, the National Association for Retarded Children could

Five years later, in 1955, the National Association for Retarded Children could report 33 such clinics with 12 additional in the planning stage. By 1956 the association was ready to go to Congress and seek additional appropriations to the Children's Bureau for grants to States under the maternal and child health program for the development of public community clinics where parents could go with their retarded children and be sure that they would get the continuing help of doctor, nurse, social worker, psychologist, psychiatrist, and others as they needed it.

It is a matter of very great satisfaction that the Congress recognized that the Federal Government, through the Children's Bureau, should assist States and communities in this work with part of the grant-in-aid funds appropriated annually for maternal and child health. As in all other programs of Federal aid to the States for child health and welfare services, the most helpful role that can be played by the Children's Bureau, besides supplying funds, is that of carrying fruitful ideas from State to State, from community to community, and helping with the development and adaptation of those ideas in the different settings and cultural patterns of each State or community. It is likewise a matter of satisfaction that the principle of equalization of opportunities for children, no matter where they live or what their socioeconomic circumstances, was recognized once again, and this time for the care and training of mentally retarded children.

When the Congress decided to earmark some of those grant-in-aid funds for community projects for the care of these retarded children, it showed great foresight in determining the program from which the funds would be taken. By choosing the maternal and child health program rather than that for crippled children the Congress placed the responsibility with those State authorities that already had the responsibility for preventive health services for all children. It was recognized that mentally retarded children, like all other children, would also need medical care when sick, or other special services when crippled or emotionally disturbed. It was clear that these children would need child welfare services and opportunities for training in nursery schools, and that the parents would need much careful counseling and continuing support.

From an administrative point of view, this new program was not very different from other specialized services under the maternal and child health program. In an article discussing the implementation of the congressional action, published in the American Journal of Public Health in January 1959, Dr. Arthur Lesser 5 points out that "the basic interests of the MCH program-early case finding, preventive health services, child health supervision, mother-child and family relationships and the growth and development of children-are also the basic interests of a program for mentally retarded children." He explains further that, through the MCH programs, special diagnostic and followup clinics can be set up, and health, education, social casework, mental health, and other medical resources of the community or State made available to these children. The regular help of public health nurse and child welfare worker, of hospitals and clinics, nursery schools, kindergartens, and early elementary school grades, and other local services of public or private agencies can be called on to help. (The basic workers in this program will be those who are dedicated to the fundamental principles of prevention and to finding ways for the attainment of the highest level of development-physical, mental, and social-of which each individual child is capable.) (They will be workers who are aware of the wide range of intellectual, emotional, and social potentialities in young children.)

In other words, as this program expands and grows, it will work through already existing channels for child health; it will utilize all resources of the State and local mental health programs; it will serve as an early case-finding resource and a referral agency. Locally such a clinical service, regardless of its administrative auspices, can serve as a focal point to which many activities for mentally retarded children can relate themselves.

I am happy to say that we have a demonstration of just this type of combined service for young mentally retarded children and their parents in Cambined service for young mentally retarded children and their parents in Cambined service for young mentally retarded children and their parents in Cambined service for young mentally retarded children and their parents in Cambined services.

⁵Lesser, Arthur J., M.D.: "New Program for Mentally Retarded Children," American Journal of Public Health, January 1958, vol. 48, No. 1, p. 9.

bridge. Here there are seven regular child health clinics for any child whose parent wishes to make use of them. In addition, however, there is a special clinic for mentally retarded children, staffed partly by health department staff, partly by staff assigned by the local mental health clinic. One of the 24 State department of mental health nursery schools or centers is associated with this clinic for mentally retarded children. The local public health nurses carry some of the work for the special clinic and are the chief source of referral of children to this clinic for evaluation and followup care.

For this evaluation and care the special clinic makes available a pediatrician, a psychiatrist, a psychologist, a social worker, a public health nurse, and a social scientist as coordinator. Other staff of the health department are also available as needed. One of its chief values to the community is that it is closely associated with other child health activities, and the staff are well aware of all the resource potentialities for extended service of the greater Boston community. Another value, that has already been initiated in the Cambridge clinic, is its use as a training center for physicians, nurses, and other professional workers. Its potential use as a research center is not being overlooked. This is the type of local service that I wish was available in every center of population of 50,000 people throughout the country. Perhaps here in Massachusetts the nucleus of such cooperative clinic centers exists now in the 24 nursery centers to which Dr. Farrell has referred.

What the earmarking of Federal maternal and child health grants does, then, is to help to spotlight the problems of these retarded children in the communities and make possible the establishment of new ways to meet their needs along lines found useful in the care of other children with special problems. Already under this program special demonstration projects have been approved by the Children's Bureau in 36 States and in 8 additional States sinilar projects have been started with Federal or State money not earmarked for this purpose. This latter group of projects is of particular significance since they involve funds which might have been used for many other purposes, but, because of local interest, they have been set aside for this particular purpose. The general objectives of these projects, regardless of source of funds, are threefold: To provide helpful services to parents and children, to study the services and explore ways to improve them, and to serve as training centers for personnel needed to staff new or expanding programs.

All told, counting both public and private projects, there are probably now more than 75 special clinics in this country for preschool and young children who are retarded. To these should be added an unknown number of mental health clinics that are serving at least to some extent as diagnostic or evaluation centers for retarded as well as emotionally disturbed children, as here in

Massachusetts.

This is a very creditable achievement, but it is only a beginning. It will take time to provide services and facilities for all the communities that need them. Two major stumbling blocks to more rapid expansion exist—enough personnel trained to do this kind of work, and funds to pay for the services, for training personnel, and for research to evaluate the programs as they go forward.

One obvious need, which is beginning to be met, is to enrich and amplify the education of medical students and practicing physicians with what knowledge we have of mental retardation and to give to them an understanding of the research that is required to extend that knowledge if we are to find pathways to prevention. If practices in communities are to be improved, physicians must be alert to current methods of diagnosis and followup work with parents in the care and training of these young children. In the course of their education, whether in medical school, hospital training, or postgraduate work, one of the things that a physician must learn is that he need not stand alone in his effort to help these parents. He may hear this theoretically in the classroom, but he will learn it most effectively if he can join with a team of workers—pediatrician. public health nurse, social worker, nursery school teacher, psychiatrist, and psychologist—and, indeed with the parents themselves, who are together operating a community clinic specially designed for mentally retarded children. of these workers has his own particular way of helping, but there is much to be gained if they work together as a team, each fulfilling his role at the appropriate time and place, and pooling with the others the results of his observations and efforts.

I have emphasized the role of the physicians, because experience shows that parents of young children do turn frequently to him first, and he has the greatest

number of chances to start parents on the most productive road to success with their children. However, any professional worker in the course of his regular work in a community may be the first to learn of the anxieties and receive the confidence of parents who are worried about their child's development. It is important, then, that a fundamental knowledge of child growth and development, both theoretical and practical, and of deviations from the normal should be included in the training of all of them. This goes for nurse, social worker, teacher, psychologist, as well as for physicians whether their primary focus is in the health, education, or welfare fields. That there should be a satisfactory diagnostic and followup clinic for mentally retarded children in which practical experience can be given would seem to be an essential part of this professional education.

Another part of this educational process, often overlooked in medical teaching, and not too well developed in any professional training, will have to do with the art of communicating ideas. It is often hard enough for physicians to explain to parents about some physical condition in their child. When they attempt to explain to an anxious parent that his or her child is mentally retarded, it becomes doubly difficult, partly because the doctor does not know too well how to impart the facts so that they will be understood, and partly because many parents, though they hear the words that are spoken, are too anxious and disturbed to take them in. Since, however, the doctor is so often a key person when the child is still very young and the parents' problems are most acute, special attention may well be given to helping him understand how to get his ideas across to the parents and how to secure the help of other professional workers who can supplement what he does by visits to the homes.

Next in importance to training personnel for work with mentally retarded children, if ultimate success of this program is to be assured, is the need to study the methods of work on a continuing basis. I am happy to say that in a number of the special demonstration projects plans have been laid to record and analyze data in ways that will help the directors of the programs to evaluate the progress they are making. This type of so-called built-in evaluation, if it is systematically and objectively followed, should point the way to rapid improve-

ment in the total program.

Lastly, I would like to reiterate the conviction of many who are struggling with this problem of mental retardation, that it is only through extensive basic research into the prenatal and postnatal factors that are causative that we will make progress in acquiring the knowledge necessary to its prevention and control.

UNMET NEEDS OF THE RETARDED CHILD AND HIS PARENTS

Presented at the Governor's Conference on Mental Retardation by Maurice Mezoff, Executive Director, Massachusetts Association for Retarded Children, Inc.

In the preceeding sessions of this conference, this group discussed the many ramifications of the problem of providing services to the 140,000 mentally retarded children and adults, and their parents, now residing in Massachusetts. Discussion has focused upon the causes of mental retardation, the nature of the condition, and the programs and techniques by which both public and private agencies in Massachusetts have, up to this point, met the challenge for the care, treatment and training of mentally retarded persons.

Since the ultimate objective of the conference is to develop recommendations for the eventual accomplishment of a total program of services for the retarded, logical procedure demands that the next step be an examination of, and perhaps a clear-cut definition of, what constitutes a total service. This process involves the determination of the unmet needs of the retarded in relation to the existing services and the designing of specific recommendations for providing services that will fulfill these unmet needs.

The scope of this report, then, is to bring into focus the yet unmet needs from the viewpoint of the child and the parent and to present a description of services designed to make possible the framework on which to build such a total program.

The approach of this report is to present facts as they relate to these unmet needs and to raise certain questions, the answer to which might present a pattern by which both private and public agencies, working in harmony, might form the basis of this total program of services.

To set the stage for our examination of unmet needs and undeveloped services, it would be well for us to briefly scan the development of services through-

out the Nation and in Massachusetts.

There have been interesting developments on a nationwide scale in that different States have tended to develop strength of service in different areas. One State may have a strong occupational training and rehabilitation program with no service to the preschool retarded child, while another State may concern itself almost wholly with recreation programs. This is probably due to the fact that—

- (1) Programs for the retarded are underdeveloped and may still be considered as experimental. Any community program is considered a step forward
- (2) The type of service of a given State may reflect the interest of a strong parents' association or professional group and their perception of the immediate needs of the retarded.

From this pattern of development we have long since learned that a model of

complete services is nonexistent.

In the eyes of the National Association for Retarded Children, the State of Massachusetts has one of the most highly developed systems of services to the retarded. Massachusetts provided residential care of the retarded over the past 110 years, dating from the opening of the Walter E. Fernald School in 1848.

Special classes first made their appearance in Boston as early as 1898.

In more recent years, through legislative action initiated by the Special Commission on Mental Retardation and backed by the Massachusetts Association for Retarded Children, the State is providing diagnostic services, nursery clinic programs, recreational opportunities and a beginning has been made in the area of occupational training and job placement. The provision of these services has involved the Department of Mental Health and the Department of Education, the Massachusetts Rehabilitation Commission, and the relationship of these agencies to their local groups. The Departments of Public Health and Public Welfare have provided a great amount of service on an individual case basis.

At the same time, associations for retarded children, Catholic groups, public health nurses, family service agencies, private hospitals, as well as many other private agencies, along with practicing physicians, etc. are all providing some

kind of treatment or care for the retarded.

If there is any marked characteristic of the growth of service to the retarded, it is that this development has taken place at a pace resembling more a change by revolution than by evolution. Each new service has pointed out the need for additional services.

While it is more desirable to proceed as quickly as possible, it is equally important that the direction taken in developing services will lead to the desired goals. It is vital, therefore, that future planning be done through an organized and systematic procedure. It is also essential that this planning be the joint effort of all of those departments of the State which will be called upon to assume responsibility for providing services in this total program.

To arrive at some concept of a total service to the retarded requires that we agree upon certain facts about the nature of mental retardation, and certain elements within our social service structure that make possible or impossible

particular techniques for achieving this service.

First, is the realization of the accepted truth that in most instances the care, management, and training of the retarded is a shared responsibility between the parent and community, and that residential care of the retarded is not the beginning and ending of service. The care of most of the retarded is done in the home. Statistics of the Department of Mental Health indicate that with approximately 7.200 patients in State schools, this represents 5 percent of the retarded population, and that 95 percent of the retarded are cared for in the home. The care of the retarded in the community necessitates, therefore, the creation of new and specialized services within the community on the one hand, and the extension of and modification of existing services on the other.

Secondly, the retarded group is made up of individuals of a wide range of intellectual abilities and social skills. They are subject to behavior disorders, emotional problems, psychoses and neuroses, as are all people, and very often their disorders complicate the symptoms of retardation. The goals and services necessary for the severely retarded are quite different from those required for

the moderately or mildly retarded.

Thirdly, because of the nature of mental retardation as a lifelong condition, there is a great need for continuity in service to the retarded. A meaningful service to the retarded implies continuing counseling and guidance as the retardate moves and develops through a chronological order of services. Herein lies the assumption that there is communication, cooperation, coordination between services.

Fourthly, there must be the realization of the interdependence and interrelatedness of services. For example, in the counseling process with parents of retarded children, the counselor, whether he be doctor, psychologist, or social worker, attempts first to achieve acceptance of the problem for the parent, but the next logical step makes it mandatory that this same counselor provide assistance to the parent by referring him or her to a facility which will provide the necessary care, education or training for the child. Good counseling becomes meaningless

without these care and training opportunities.

On a broader level, this same interrelatedness of service has a cause and effect relationship between existing facilities. This has been markedly illustrated by the impact that the development of special education in the community has had upon the State school populations. All of our State school superintendents are now very much concerned with the fact that special education has resulted in a trend that has lowered considerably the IQ level of the State school populations. In the 20-year span between 1935 and 1955, the extremely retarded population (IQ under 20) increased from 13.9 percent of school population to 19.7 percent of school population, and the severely retarded (IQ 20-49) increased from 43.3 percent to 51.2 percent, or a total of 70.9 percent of total school populations presently is within the extremely or severely retarded range. This, in turn, has changed the staff needs, and program of the State schools.

Fifthly, in the development and growth of services, a very important factor is one of correct timing and coordination. To put it in the vernacular, one must be at the right place, at the right time, with the right ingredients in order to achieve a given aim. This involves the placement of services in areas where children are present, where facilities are possible, and where professional staff is

available

Compounding all of these complexities, are factors in the overall situation of a lack of trained personnel and the usual resistance to change embodied in our professional service. What is needed is a critical analysis along the following lines:

(A) A clear definition of the goals.

(B) Clear understanding of the needs to be served to reacn the goals.

(C) Effectiveness of techniques for filling the needs. There tends to be general agreement among professional people as well as parents of retarded children that the goal we seek for the retarded child is that he or she be given every opportunity to achive his or her fullest potential for leading a happy

and useful life.

A total or comprehensive program of services is the technique by which these opportunities for reaching fullest potential may be realized within the individual. The best list of such services is contained within a document entitled "Proposals on a Federal Program of Action in 1956–57 for America's Mentally Retarded Children and Adults," submitted to the Honorable John E. Fogarty, Congressman from Rhode Island, by the National Association for Retarded Children.

They provide for-

1. A network of community diagnostic-treatment clinics with professional counseling for parents;

2. Home counselors to help parents in training the infant and child in the home;

3. Nursery classes, with normal children whenever possible; special nursery class and day-care centers for the more severely retarded;

4. Special education with improved vocational training for the "educable" child:

5. Special education with improved social training for the "trainable" child;

 Vocational training centers and sheltered workshops, including personal adjustment training and terminal employment opportunities;

7. Community centers with recreational, social, and counseling facilities for the adolescent and adult retarded who are dependent and cannot be integrated into the facilities for normal people;

8. Integration of the "marginally independent" retarded in society, including vocational rehabilitation and selective placement in regular employment:

9. Dynamic, community-minded residence centers; and

10. Research and professional training.

Additional obvious needs are provisions for short-term care during the family crisis and in the case of the more severely retarded, short-term care is needed in order that the families might have some vacation from the constsant pressure and tension created by this child in a family situation.

Halfway houses, as a means of integrating the former institutional retard-

ate in the community.

One of the most perplexing and anxiety-producing problems faced by parents of the retarded is what will happen to the retardate after the death of the parent. This relates itself to the area of guardianship problems, and requires serious study and an early solution.

There is a need for a complete evaluation as to the criminal responsibilities of the defective delinquent and the development of care and treatment centers

for these individuals.

Sometimes we become so concerned with the specialized needs of the retarded that we forget they also require the same kind of services which all of us need to lead a useful, happy, and productive life—adequate medical care, dental care, recreational opportunities, for example. And even here, the retarded require modified approaches for these usual services. Connected with medical care for the retarded is possible use of drug therapy. Connected with there is the need possibly of dentistry performed while the patient is under total anesthesia. The application of corrective measures for the improvement of speech, hearing, and sight—parenthetically, I would like to add that current research being conducted at the University of Texas gives indication that the correction of some of these physical deficiencies has led to an improvement in intellectual performance—in some cases raising the IQ level of the retarded child from the trainable to the educable classification.

All of these extensions of usual types of care point to the need for specialized professional training and cooperation among disciplines to recognize and accept their responsibilities for fulfilling these exceptional needs. While time does not permit a complete analysis of these needs, it is important that further con-

sideration be given many of the items.

 A network of community diagnostic-treatment clinics with professional counseling for parents

The term "network" implies geographic distribution of diagnostic treatment. As of the present time, opportunity for diagnosis is available in the public agency field through outpatient services provided by the State schools. Some diagnostic service is available through mental health centers. Diagnosis occurs mostly, however, in the office of the general practioner or pediatrician, or in a private hospital. Most of the clinic services, however, are located within the eastern region of the State.

Good diagnosis for the retarded child cannot be a one-time process, but must be a continuing program, accompanied by periodic evaluation of progress—or lack of it. The fact that the symptom of retardation can be both simulated and stimulated by overtones of emotional factors, physical defects, and limited opportunities for socialization, emphasized the need for this periodic testing

of the individual.

Directly connected with the diagnosis and evaluation process is the problem of parent counseling. The very fact that the parent brings the child for a diagnosis is indication of a premonition on his part that all is not well—the confirmation of the fact of retardation by diagnosis can have a shattering effect if the findings are not presented skillfully. And in this instance one might well sacrifice objectivity for compassion—technical terminology for clarity in explanation. Counseling, while pointing out the limitations of the child, should also assess his positive attributes and potential for achievement through education or training.

In the development of diagnostic services, the question of the effectiveness of the specialized clinic versus the general clinic requires serious consideration. Adequate counseling services require the greatest amount of knowledge as to available facilities and effectiveness of training programs for particular types of mental retardation. In this area, also, there is a great need for more effective

techniques in evaluation of mentally retarded children. In addition, there is needed clearer definition of the role that each of the disciplines play in jointly planning for the retarded so that, with maximum knowledge about the child, they can together produce the most effective plan for the care and treatment of the child.

2. Home counselors to help parents in training the infant and child in the home

In Massachusetts, this kind of service is extremely limited and fairly well confined to the individual efforts of public health nurses, the advice and connsel of the pediatrician or general practitioner, and in some instances a psychiatrist, There is no organized program now meeting this crucial need. Doctors and other professional disciplines have long recognized the need for early diagnosis so that proper care and training might begin at the earliest possible moment. Mothers need a great deal of help in something as simple as toilet training the child.

Within this area is raised the question of whether or not there is a need for legislation which would make it mandatory for doctors and hospitals to report, as they do in other diseases, the birth of retarded children. It would then become incumbent upon the public health nurse to make periodic visits to help in the care and training of the child in the home. This also relates itself to helping to prevent immediate placement in an institution of newborn children. It also provides the opportunity for evaluating the impact of the retarded child on family life so that counseling can be provided for heading off difficulties.

3. Nursery classes, with normal children whenever possible; special nursery classes and day-care centers for the more severely returded

In this area Massachusetts has forged well ahead, in that its nursery clinic program is functioning at the present time, not only in providing nursery programs but in terms of evaluation services, speech therapy, and medical care when needed.

Day-care centers in the communities are nonexistent for the retarded. One of the great needs as of the present moment is for some type of service for the atypical child who through behavior disorders, severe retardation, hyperactivity, or lack of special education opportunity is given no service whatsoever. Day-care programs provide the opportunity for care of these severely retarded in the community on a shared basis between the service and parents and reduces the need for institutionalization. For those with emotional problems, it should provide the opportunity for psychiatric treatment, so that the child might be prepared to enter other services. For the emotionally disturbed, also, there is need in these programs for counseling with parents to adjust the home environment so that the child might better respond to treatment. Here, we might raise the question as to whether or not day-care centers are a normal extension of State school services or an independent function.

4. Special education with improved vocational training for the "educable" child

In Massachusetts special education is a highly developed service for the educable child. There is great need, however, for evaluation of the role of the schools in the preparation of the educable for employment, the responsibility of education in job placement, and the need for personnel in the area of "followup."

Within this area, also, is the need for definition of the respective roles of both education and the rehabilitation commission. Is this a joint responsibility or

is there a need for clearly defined areas of responsibility?

5. Special education with improved social training for the "trainable" child

At the present time there is required here clearer definition of the goals for the trainable child, the question of whether or not facilities for the trainable child should be separate and apart from the school systems or whether they should be further integrated into school systems. The whole area of activity for the postschool trainable child needs a great deal of study and exploration.

Vocational training centers and sheltcred workshops, including personal adjustment training and terminal employment

This relates itself to our fourth and fifth points. There is need here for the creation of such services and a clear understanding as to the responsibilities of education and the rehabilitation commission in fulfilling these needs. Exploration is necessary as to whether or not such centers should be residential to accommodate retardates from different areas of the State or whether or not these

services should be developed in small units with larger geographic spread. Or, are sheltered workshops the basic responsibility of private agencies?

 Community centers with recreational, social, and counseling facilities for the adolescent and adult retarded who are dependent and cannot be integrated into the facilities for normal people

This type of opportunity for recreation and socialization has been successfully operated in Great Britain for a number of years. American community life offers every opportunity for success in the achievement of such services. YMCA's, Boys Clubs, and other community group work centers could be induced to assume such responsibilities in cooperation with local associations for retarded children.

8. Integration of the "marginally independent" retarded in society, including vocational rehabilitation and selective placement in regular employment

This process of integration takes place around us day by day. The marginally independent group, in followup studies of special class graduates in the Fitchburg area, reveal interesting patterns of this integration. These young people find jobs, own cars, marry, and raise families. These same studies point out both the successes and happiness achieved as well as their trials and tribulations. Girls tend to keep better homes and give better care to their children than did other parents. Job placement is achieved almost exclusively through family contacts (about 85 percent) with almost no use of public or private agency help. A marked characteristic is the frequency of job changing over relatively short periods of time.

Here, again, is indicated the need for guidance and counseling as to occupational goals, training, and techniques in finding jobs. There is need for interpretation to employers relative to promotion—whether it be desirable or undesirable in the case of the individual involved. Need also exists for continued contact on the part of the retarded with a counselor for encouragement, after failures, to try and try again.

Our Massachusetts Rehabalitation Commission has moved rapidly and well

into this area of service. Much remains to be done.

9. Dunamic, community-minded residence centers or institutions

The general trend in Massachusetts has been to relate as closely as possible the State school and the community. Limits have been proscribed by geographic location. As of the present time, our State schools provide not only 24-hour patient care and training opportunities for those in residence but also serve the community through outpatient, diagnostic clinics, day occupational training programs, and now legislative action has provided money for personnel for day recreation programs. In addition, our State school superintendents have encouraged staffs to educate the general public about mental retardation and the institution through musical and other programs presented before civic groups, PTA's, and others.

Wherever possible, encouragement has been given to the use of State schools for training purposes in conjunction with neighboring hospitals and universities. At this time, it would be most desirable to investigate the possibility of further use of our State institutions for training purposes by universities in the non-medical disciplines. What is needed in both the medical and nonmedical fields is an aggressive policy of recruitment and the development of a climate and of facilities within the State school that would provide opportunities for good training and genuine research.

Long-range planning for State schools in Massachusetts might well be the subject matter of a similar conference in the near future. Questions need to be answered about future building programs, relative to location and size of unit, type of staff and equipment needed to serve the changing populations, how these may be related to hospitals and universities, and the possible development of the cottage system, and the development of further colony-type installations for serving the retarded. Recent trends toward inservice training need to be encouraged and explained.

From the viewpoint of the parent, the economic strain of rising costs of keeping children in the State schools is becoming an alarming problem. There is great need for setting a maximum and reasonable fee charge. The question of whether or not parents should have financial responsibility after the retardate has reached the age of 21 needs to be examined. In the case of some retardates who perform services at the State school, consideration should be given to com-

pensation for the services performed. The inservice training program for patients at Monson State Hospital should be examined for possible application at other State schools.

None of these ideas will be new concepts, but have been topics of discussion of our leading professional workers in this field over a number of years. In some areas of the country these concepts have become a reality and a means of service to the retarded and the community.

10. Research and professional training

Massachusetts has been one of the leading States in the area of medical research and has taken advantage of available funds from Federal and private sources to implement its programs. While it is not our intention to minimize the importance of medical research as it relates to the prevention of mental retardation, what is needed in Massachusetts is greater stress in the nonmedical areas to provide new knowledge about techniques in the training, care, and management of the retarded. While we are blessed in Massachusetts with glittering constellations of institutions of higher learning who specialize in those particular disciplines which can push back the frontiers of our ignorance in all of these areas, little or no research relating to the particular problems of retardation are conducted at these universities. What is needed is a definite program designed specifically to encourage these universities to seek available funds for the development of full-scale, long-range research programs.

There is great need for the development of new evaluation techniques by psychologists. Social workers need to know about the impact on family life of the problem of retardation. Even at the simple level of examining the waiting list at State schools to determine needed services, research could be carried out. Only if we accept the challenge of research can we hope to make progress. While we may be forced into geographic isolation because of the locations of our State schools, the failure to develop research projects would be the result of our own

intellectual isolation.

dependent on-

In the professional training area, Massachusetts enjoys the dubious distinction of having trained more people for service in other States than any other university center in the country. This relates itself to the unrealistic salary scale of State employees at all levels. Actually, salary scales are far below those paid for equivalent positions by either private or Federal agencies. This has tended to make transient those professional workers trained in Massachusetts. The desire on the part of trained professional workers to properly feed, clothe, and educate their families need not be considered as a lack of dedication or idealism. Our continued failure to face the reality of substandard pay scales must inevitably lead to the lowering of standards of services.

Over and above this, there needs to be consultation with our university administrators for the inclusion of information regarding mental retardation within the curriculum of these training institutions. We must discuss whether or not separate courses ought to be encouraged or whether mental retardation should become a normal part of any given curriculum in the training of professional workers whose skills are required in serving the retarded. There needs to be discussion about the most effective techniques to be used in getting information about mental retardation to those workers already trained and now functioning on jobs throughout the Commonwealth.

In summary, I would like to point out that in this dissertation I have merely shown what, from our experience, are the unmet needs which must be fulfilled if retarded children and their families are to achieve the status of first-class citizenship which is the inalienable right of us all.

I have posed the questions and, in setting forth some of the needs, I believe I have given some indication of the agencies which might bring their skills and

forces to bear in attempting to meet them.

The dramatic progress which has been taking place in the field of mental retardation is directly proportionate to the interest which has been stimulated in professional workers. As parents have articulated their problems, dedicated leaders in the professions of medicine, education, psychology, social work, rehabilitation, and other areas have come forward to help in seeking solutions.

In reality, our only regret—as manifested by the theme of this conference—is that programs have developed unilaterally within disciplines.

Despite a healthy year-to-year progress in Massachusetts in specific services to the retarded, there are increasing signs that there is great need for organization and careful planning in developing further services. Further progress is

A determination of the exact needs of the retarded.

Evaluation of existing facilities and services in relation to these needs.
 Coordination, cooperation, and communication between all professional disciplines.

4. Communication and coordination between public and between private

and public agencies.

5. Careful planning with the most efficient use of existing facilities.6. Stimulation of interest in the problem among professional people.

7. Increased opportunities for training workers in this field.

The concept of coordination in this field is actually a call for statesmanship; it requires that agencies which to date have done little in the field of mental retardation assume more responsibilities in the areas in which they can best provide services—it requires also that agencies which have been traditionally responsible for some areas of care (because the needs were not being fulfilled elsewhere) relinquish the reins and responsibilities for implementation of these programs to agencies better qualified by training and staff to carry them out.

programs to agencies better qualified by training and staff to carry them out. I believe that our meeting together over the past few days is singularly significant, not because this group has devoted its time, energies, and intellect to resolving problems as they relate to the mentally retarded, but because it may set a pattern of cooperative action among professional workers which will make it possible in the future to seek solutions to equally difficult problems which affect our people and our community. Our meeting over the past few days means that we have accepted the challenge, and the benefits derived from our joint thinking

will mean a happier, more fruitful life for all of our citizens.

RESOLUTIONS—GOVERNOR'S CONFERENCE ON MENTAL RETARDATION, MAY 26-27, 1959

Resolution No. 1: This committee recommends that His Excellency, the Governor, take whatever steps are necessary to create an interdepartmental committee composed of all departments concerned with the mentally retarded, headed by the commissioners or their representatives.

Resolution No. 2: That there be created a Governor's Conference on Mental Retardation composed of public and invited private agencies which will meet every year for the purpose of overall planning in the field of mental retardation, the expenses of which will be met by the various departments and agencies. This annual conference is to be called by the Governor.

Resolution No. 3: It is recommended that the chairman of such an interdepartmental committee shall report to any legislative commission on mental

retardation that shall exist.

Resolution No. 4: It is recommended that the Governor shall use his office to assure widespread publication and distribution of the report of this conference.

WORKSHOP No. 1

TEAM APPROACH OF THE DIAGNOSIS, EVALUATION, AND PLANNING FOR THE RETARDED CHILD

Workshop leader: B. R. Hutcheson, M.D.

The following resolutions and recommendations were formulated:

1. For those children placed in special class, the practice should be encouraged

of adequate and appropriate followup for both child and parent.

2. The responsibility for interpreting to parents that they have a mentally retarded child should rest on the findings which utilize the team approach for diagnosis. Such a team should be composed of at least a physician, psychologist, and social worker.

3. The practice of diagnosing and evaluating retarded children on the basis of an IQ score alone should be discouraged. In addition, it is recommended that a psychometric examination should not be considered the equivalent of a psychological examination.

4. Every retarded (or suspected retarded) child is entitled to comprehensive medical, social, and psychological evaluation before entering school.

5. It is recommended that in medical school curriculums there be provision for training physicians in the various diagnostic aspects presented by the re-

tarded child. In the training of pediatricians, psychiatrists, and child psychiatrists there should be provided the experience of working with, diagnosing, and treating the mentally retarded.

Workshop No. 2

RECOMMENDATIONS OF WORKSHOP ON PLANNING FOR THE PRESCHOOL RETARDED CHILD

Workshop leader: Lewis B. Klebanoff, Ph. D., S.M. in hygiene.

 Strengthening of child health and welfare services throughout the State will aid the retarded and should be encouraged. This includes—

A. The DCG.

- B. The local welfare—ADC.
- C. The well-child conference.

D. Day care center services, etc.

- Working relationships should be established between the nursery centers and day and residential schools and other community facilities to help in developing a continuing life plan appropriate to each child and his family.
- Increasing emphasis should be placed in early case finding with particular reference to special risk situations, such as premature births that are routinely
- known to health agencies.

 4. Provision should be made for expanding and coordination of clinical services to existing nursery centers and to geographical areas of the Commonwealth where there are no services.
- 5. Provision should be made for encouraging the colleges and universities to include training programs for teachers of the preschool retarded.
- 6. Provision should be made for personnel to provide aid in the home to the mother in improving the self-help skills of the child under 3 years of age.

WORKSHOP No. 3

MEETING THE NEEDS OF THE SCHOOL-AGE RETARDED CHILD

Workshop leader: Philip G. Cashman, Ed. D.

- I herewith submit to you the resolutions recommended by Workshop No. 3:
- 1. To develop a more comprehensive program for the early and accurate identification of mentally retarded children.
- To develop a common understanding between the teacher and members of other disciplines concerned with the mentally retarded child.
- 3. To develop a team approach for interdepartmental counseling. The teacher of the mentally retarded should play an important role in this program.
- 4. To enrich the training of the special class teacher by including additional training in mental hygiene, guidance, and occupational information.
- 5. To provide training facilities and personnel at all State teacher colleges for the purpose of aiding prospective regular classroom teachers to identify mentally retarded children at an early age.
- To provide both special class teachers and regular class teachers with inservice training programs for the better understanding of the mentally retarded child.
- 7. To provide more adequate guidance, occupational training, placement and followup services at the local and State levels.
- 8. To stimulate grassroots conferences to submit proposals and resolutions which may be considered at State conventions.
- The establishment of better lines of communication among all agencies concerned with the mentally retarded. To organize an effective program of public relationships.
- 10. To develop additional avenues of interdepartmental cooperation for the better identification, referral, and treatment of mentally retarded children. Such a program should spell out the responsibility of various agencies concerned with the mentally retarded.
- 11. That all children referred by classroom teachers for examination under the provisions of General Laws, chapter 71, section 46, and the regulations pur-

suant thereto, shall be given such examination at the earliest possible moment.

12. That the team approach to the diagnosis and treatment of the mentally retarded be encouraged.

13. That copies of the report of this panel be summarized and sent to participating members.

WORKSHOP No. 4

THE PROBLEM OF THE RETARDED ADULT: HABILITATION AND REHABILITATION

Workshop leader: Francis A. Harding.

Resolutions voted by the participants of workshop 4 under the leadership of Commissioner Harding:

1. To make a study of retarded individuals to determine job potential while they are still in school.

2. To provide proper occupational training, guidance, and job placement to meet the needs of the mentally retarded.

3. To develop an orientation program including employers in order that they may understand occupational potentials of the retarded.

4. To place greater emphasis on community responsibility in providing occupational opportunities for the retarded.

5. To pool resources of the community to provide an adequate program and to assist in the occupational training of the retarded.

6. To expand facilities for exploring job opportunities within the community.

7. To make mandatory present legal provisions for regional occupational training classes for retarded children. 8. To establish occupational training centers in Massachusetts for vocational

and social rehabilitation for men and women. (Halfway Houses, etc.) 9. To encourage passage of legislation to establish a program for "independent living" in Massachusetts for mentally retarded individuals who lack oc-

cupational rehabilitation potential. 10. To provide a continuous followup program on local and State levels to develop and encourage a cooperative system between various agancies which deal

with the retarded child within the city and the State. 11. To develop and encourage a cooperative system between the various agencies which deal with the retarded within city and State in all phases of adjustment.

WORKSHOP No. 5

THE ROLE OF THE RESIDENTIAL CENTER IN COMMUNITY SERVICE TO THE RETARDED

Workshop leader: Karl V. Quinn, M.D.

Resolutions:

 A defective delinquent person should be sent to a reception center, such as Lancaster or the youth service board, for a certain period and then be transferred to a special security unit at a State school.

2. That State schools should have the facilities to care for any mentally deficient child with any type of emotional or delinquent problems.

3. That State schools be equipped to give training to prospective personnel in the communities.

4. That State schools should be reduced in size and new ones located so that they could be of more use to more communities with prospect of being able to employ adequate personnel from these communities.

That volunteer and parent associations be strengthened and supported.

6. That a greater latitude of visiting in State schools be recommended for better public relations.

7. That added efforts be made for greater cooperation with the universities and centers such as Massachusetts General Hospital.

8. That efforts be made to reduce the isolation of people in the western part of the State from community and other services, other than those of the Belchertown and Monson areas.

9. That children with an IQ between 0.75 and 0.90 be in a program for placement as part-time workers in institutions at a small but adequate salary.

10. That further collaboration is desired between mental health centers, State schools, and school psychologists for increased services to mentally retarded children who are living in the community.

11. That the vocational rehabilitation commission and State schools develop

more and greater cooperative programs.

WORKSHOP No. 6

Social Adjustment Problems of the Retarded

Workshop leader: Francis J. Kelly.

This workshop recognized that social adjustment is determined by emotional as well as intellectual capabilities; it also recognized that the adjustment of these persons to society is determined to a great extent by society's adjustment to them.

Utilizing this frame of reference, our panel and group discussed and agreed upon three basic premises upon which we predicated our discussion and the

resolutions it produced.

BASIC PREMISES

We must not lose sight of the human dignity and worth of the retarded. Because an individual is intellectually limited, it does not make him less human or reduce his spiritual value. We must see the person in his totality, not emphasize his weaknesses without bolstering his strength.

The retarded have emotional needs and are as sensitive to deprivation and lack of affection as the normal group. They are as susceptible to the same emotionally crippling illnesses as they are to the same physical illnesses—perhaps more so, since the normal person can utilize intellectual abilities to mobilize defense systems to ward off unpleasant life experiences, while the retarded does not have adequate intellectual resources to call upon.

Principles of good positive mental hygiene are as applicable to this special group as they are to the general population. The establishment of positive, meaningful relationships in early life with the parents, and later in the school

and community, is of vital importance.

We feel that we can categorize our resolutions into the three main areas of personal interaction in which we all most participate. These areas are the home, the school, and the community.

RESOLUTIONS OF WORKSHOP

A. The home

1. Whenever possible, the retarded person should be maintained in his own home. Public assistance benefits should be provided, if necessary, to maintain him in his home, even though the family may not be eligible for or receiving other public assistance.

This resolution applies only where the person's presence in the home is not

harmful to him or the family.

2. If it is necessary to remove a retarded child from his home, first consideration for placement should be in a foster home. Institutionalization may be the

easiest but is not always the best placement for the child.

3. Within the family structure, parents and siblings should be urged to accept the retarded person where he is and how he is. Overindulgence and overprotection can be as damaging as deprivation and neglect. The retardee should be accepted with his limitations, as an individual, with the understanding that he will react to either extreme of care or neglect as normal children will.

4. Education of parents should be offered to aid in the early recognition of retardation, and in this way avoid the trauma which might occur prior to their

realization of the limitations of the child.

5. The expansion of group parental counseling under the direction of trained group therapists should be encouraged; also, support of programs whereby parents of these children may meet and discuss their difficulties with one another for mutual benefit, information, and support.

B. The school

1. The school should offer every child an opportunity for success, despite his limitations. This will involve a reexamination of our present concept of and emphasis upon academic performance. Diagnosis of retardation should be the result of a complete psychological examination by a well-trained person as

opposed to that based on a numerical score obtained on a psychometric examination

2. We strongly urge the retention of children in school beyond the compulsory age of 16 if any benefit can be derived from this retention. Conversely, for those children who have attained maximum benefit prior to their 16th birthday, arrangements should be made for withdrawal. The child turned out too soon, or retained too long, may well discharge the feelings resulting from the inherent frustration in unacceptable behavior.

3. We favor improved communication with teachers to enable them to recognize and understand these children, and assist in the handling of the problem they

represent.

C. The community

1. Education of the public through use of existing media to enable them to better accept the retarded, inform them as to causes, and help remove the stigma attached to both the retarded and his family still found today.

2. Education of the professional people having contact with the retarded or their families. The program should include not only medical people but the clergy, school, the police, courts, etc., who may use this information to better

meet the problem.

3. Formation of social and recreational groups of retarded persons, particularly in adolescence and postadolescence, to provide social interaction under the supervision of trained adults. This will provide an opportunity to develop social skills, and existing services such as YMCA, boys' clubs, girls' clubs, CYO, settlement houses, etc., may be utilized.

4. When a retarded person acts out antisocially and is brought before the courts, expert diagnostic assistance to the court in making the differential disposition of whether to treat the person as a retarded or defective, or as a de-

linquent or criminal.

5. Establishment of a new, separate and adequately staffed and programed facility within the existing framework of the State schools, for the defective delinquent children who, due to their impulsiveness, hyperaggressiveness, and

severe retardation, cannot be handled properly in existing institutions.

6. Restudy of the existing defective delinquent legislation by a joint commission, with representatives of all professional disciplines interested in the problems such as law, psychiatry, education, psychology, etc. We feel that consideration should be given to the fact that the defective person now has to comit a dangerous act before legal steps may be taken. If, and always bearing in mind the individual's constitutional rights, expert evidence was presented that the potential for such action was present and the imminence of the act itself was guaranteed, could legislation be amended so that the individual could be removed from the community before he harms someone or himself?

Mr. Giaimo. The next witness is Michael F. Marinkowski, executive director of the TB and Health Association, Burlington, Vt.

STATEMENT OF MICHAEL F. MARINKOWSKI, EXECUTIVE DIRECTOR, TB AND HEALTH ASSOCIATION, BURLINGTON, VT.

Mr. Marinkowski. I would like to withdraw as a witness in view of the fact that suggestions are going to be brought up by the workshop in which I participated.

Mr. Giaimo. Thank you very much.

Fred D. Knittle, director of development, Clarke School for Deaf, Northampton, Mass., is our next witness.

You may proceed, sir.

STATEMENT OF FRED D. KNITTLE, DIRECTOR OF DEVELOPMENT, CLARKE SCHOOL FOR DEAF, NORTHAMPTON, MASS.

Mr. Knittle. Mr. Elliott, members of the committee, it is a distinct pleasure to appear here today to read into the record of this hearing

a few important facts pertaining to the critical shortage of classroom

teachers of the deaf.

My relationship to this special field of education has been of relatively short duration. In replacing Mr. Evan Johnston as director of development of the Clarke School for the Deaf, I have assumed his role as a spokesman for the Conference of Executives of American Schools for the Deaf. I have become increasingly aware of this growing need and can appreciate the problems faced by the leaders in this field.

In the few short months since House Joint Resolution 494 and its counterparts were introduced, we have received numerous letters from educators, parents, and friends, from all over the United States, stating their great interest in this bill and their sincere desire to see its early passage. They join with me in support of this resolution.

No one knows exactly how many people in the United States are deaf. It has been estimated that as many as 15 million people have some loss of hearing and that 8 million of these suffer a loss sufficient

to warrant the use of a hearing aid.

Many people with hearing losses can be helped by medical, surgical, or mechanical means to regain their hearing, or at least to compensate for it

101, 10

There are, however, from 170,000 to 200,000 people who are truly

deaf; that is, they cannot recognize sound as we know it.

Only through intensive training in a highly specialized program and in the use of the small amount of residual hearing they may have can they compensate for this loss.

Modern medicine has done much to overcome many disabilities in children. But, at the present time, education, not medicine, provides

the major hope for the deaf child.

There are today nearly 30,000 children enrolled in 365 schools and classes for the deaf in the United States. Most of them have one thing in common: they became deaf before they had acquired language. A deaf child may see a person's lips move, but he cannot relate that movement to sound, nor can he relate it to the written word or visible object.

He has no language at all. To put the components of language into a meaningful relationship is the primary mission of the teacher in a school for the deaf. For the deaf child, this teacher is the bridge between his world of silence and the world of sound around him. To a considerable degree, the success with which he reconciles the two worlds together depends on the skill and patience of his teacher.

For a number of years there has been an acute shortage of trained academic classroom teachers of the deaf. The situation has grown progressively worse as the number of qualified teachers of the deaf being graduated each year fails to keep pace with the growing demands.

Every administrator of special schools or classes for the deaf in the United States is being confronted with the problem of increased enrollment and a dwindling supply of professionally trained teachers of

the deaf.

This year, a survey of the need for classroom teachers of the deaf has been made by Mr. Johnston, my predecessor, and Dr. D. Robert Frisina, director of the Hearing and Speech Center of Gallaudet College in Washington, D.C.

I would like to quote several paragraphs from this study and to com-

ment upon some of its findings:

A number of factors apparently have contributed toward making the teacher shortage critical. The recruitment of teachers in the field of general education has not kept abreast of the needs. Undoubtedly, the need for special teachers of the deaf reflects in part the teacher needs of the Nation as a whole.

Although the percentage of deaf among the general population of the United States probably is not changing, the actual number of deaf children is likely to be increasing as a result of the increase in the overall population of the United States. New medical discoveries and techniques which tend to decrease the mortality rate also may be contributing to the increase in the number of deaf children who otherwise might not have lived prior to such medical advancements. Earlier detection of problems in hearing has resulted in initiating special training at a younger age.

Classes for the multiple handicapped deaf also are being established and require additional teachers. A considerable number of teachers of the deaf are employed in speech and hearing clinics, the number of which has grown rapidly

since 1945.

Finally, the supply of classroom teachers of the deaf has scarcely been sufficient to meet the needs brought about by retirement from the profession for one reason or another.

The study was undertaken to determine the need for trained academic classroom teachers of the deaf. In order to approximate the supply-demand ratio, some 365 administrators in special schools and classes for deaf children in the United States were contacted. Of this number, 233 replied to specific questions designed to reflect the overall need for teachers during the academic year 1959-60, to provide information concerning past years, and a general question pertaining to the future.

Of the 233 educational facilities responding, they represented 5

categories:

Public residential schools:

Public day classes;

Public day schools;

Denomination and private residential schools;

Denominational and private day classes.

The study points out that 516 trained classroom teachers of the deaf were needed in the United States during the 1958-59 school year. To meet this demand, only 118 teachers were graduated from the 22 approved training centers, leaving 111 educational facilities, about 48 percent; unable to fill their needs.

The year 1959-60 holds no great promise. In June of 1959, 127 teachers in training graduated, but 15 of these were foreign students, and will teach in foreign lands. This left 112 teachers available to

fill 511 vacancies in the United States.

Prior to June of 1959, six training centers indicated no trainees

enrolled at all.

The future holds an even greater challenge. Sixty-eight percent of the 233 responding indicated that they would require an increase in the number of trained classroom teachers of the deaf due to future expansion. Although 3 more training centers have been approved and the number of teachers in training to be graduated at the end of this school year has increased to 161, we are far from meeting our teacher requirements. Five centers have no teachers in training even now.

What, then, is the alternative?

The problem can be met several ways.

First, classes can be, and are, expanded beyond a good teacherstudent ratio. Because of the type of almost individualized instruction needed by these young people, this is not available. Another alternative is to limit the enrollment of deaf children.

Another alternative is to limit the enrollment of deaf children. With the growing number of deaf children requiring this special education, this would only compound an already serious problem.

Another possibility, and I'm afraid one that is being practiced because of necessity, is to employ teachers who are unqualified in this field, and to provide them with inservice training. Because of the heavy load on present teachers, this also is quite impractical.

The only reasonable answer is to provide such an incentive as to attract many more high caliber young people to this special educa-

tional field.

The financial assistance included in this resolution would be a great help in providing incentive to those who normally would not enter the profession because of economic limitation. Through this, and by increasing our own recruiting activities, this problem can be eased.

It was not too many years ago that a deaf child, mute only because he was unable to hear, was forced to walk a path of loneliness, isolation, and many times ridicule. But today, providing with specialized education by dedicated and responsible teachers, this same child can become a self-supported citizen making an effective contribution to a hearing world.

I urge you to help us meet this growing demand for academic class-room teachers of the deaf by favorable action on House Joint Resolution 494.

I submit also the study by Dr. Frisina and Mr. Johnston.

Mr. Giaimo. Without objection, the papers will be made a part of the record.

(The material referred to follows:)

[Study by Dr. D. Robert Frisina and Mr. Evan V. Johnston]

A STUDY OF THE NEED FOR ACADEMIC CLASSROOM TEACHERS OF THE DEAF IN THE UNITED STATES

For some time administrators of special schools and classes for the deaf in the United States have been aware of an acute shortage of trained academic classroom teachers of the deaf. The number of professionally trained teachers of the deaf being graduated each year has failed to keep pace with the demand.

A number of factors apparently have contributed toward making the teacher shortage critical. The recruitment of teachers in the field of general education has not kept abreast of the needs. Undoubtedly, the need for special teachers of the deaf reflects in part the teacher needs of the Nation as a whole. Although the percentage of deaf among the general population of the United States probably is not changing, the actual number of deaf children is likely to be increasing as a result of the increase in the overall population of the United States. New medical discoveries and techniques which tend to decrease the mortality rate also may be contributing to the increase in the number of deaf children who otherwise might not have lived prior to such medical advancements. Earlier detection of problems in hearing has resulted in initiating special training at a younger age. Testing and treatment of preschool children with impaired hear-

ing were emphasized approximately 15 or 20 years ago, and at present 2,892 ¹ children under the age of 6 are enrolled in schools and classes for the deaf. If a pupil-teacher ratio of 6 to 1 were attempted, this group alone at the present time would require approximately 482 additional teachers above the needs of the schools and classes prior to the emphasis on preschool programs. Classes for the multiple handicapped deaf also are being established and require additional teachers. A considerable number of teachers of the deaf are employed in speech and hearing clinics, the number of which has grown rapidly since 1945. Finally, the supply of classroom teachers of the deaf has scarcely been sufficient to meet the needs brought about by retirements from the profession for one reason or another. The most recent figures concerning the number of professionally trained teachers of the deaf becoming available June 1959 is reflected in the January 1959 issue of the American Annals of the Deaf ² and is reportedly 127. Among these 127 are approximately 15 foreign students who will not be available to teach in the United States.

The present study was undertaken to determine more closely the magnitude of the need for trained academic classroom teachers of the deaf. In order to approximate the supply-demand ratio, some 365 administrators in special schools and classes for deaf children in the United States were contacted. Of this number, 233 replied to specific questions designed to reflect the overall need for teachers during the academic year 1959-60, to provide information concerning past years, and a general question pertaining to the future. The specific questions are the specific questions are the specific questions are the specific questions.

tions asked each administrator were:

(1) How many new trained classroom teachers of the deaf will you need next year (1959-60)?
 (2) How many new trained classroom teachers of the deaf did you need last

year (1958-59)?

(3) Were you able to fill this need?
(4) What do you estimate has been your average yearly need for additional

or replacement classroom teachers for the past 10 years?
(5) Will your present needs increase through expansion?

The above data were analyzed with the 233 educational facilities for the deaf considered in five categories:

Public residential schools.

(2) Public day classes.

(3) Public day schools.

(4) Denominational and private residential schools.

(5) Denominational and private day classes.

Information pertaining to the needs for teachers during the 1959-60 academic year and the average number required for each type of educational facility is summarized in table I. Ninety-six percent of the administrators in public residential schools responded to the inquiry. These 69 schools reported a need for 256 teachers or an average of 3.71 per school. Fifty-five percent of the public day classes responded and indicated a need for 153 teachers. Of the 124 public day classes providing this information, each needed an average of 1.23 teachers. All of the 10 public day schools responded and collectively indicated a need for 44 teachers, which is an average of 4.40 teachers per school. Thirteen denominational and private residential schools reported a need for 33 teachers, an average of 2.53 for each school. Forty-two percent of the denominational and private day schools and classes suggested a need of 25 teachers, an average of 1.47 each. The totals indicate that 233 (64 percent) of the 365 educational facilities responded. As a group, this indicated a need of 511 teachers for This represents 2.19 teachers for each educational facility. 1959-60.

The American Annals of the Deaf, vol. 104, No. 1, January 1959, p. 154.
 The American Annals of the Deaf, vol. 104, No. 1, January 1959, pp. 108-110.

Table I.—Academic classroom teachers of the deaf: Reported needs for 1959-60

Type of educational facility	Total number reportedly in the United States 1	Number responded to inquiry	Percent of total re- sponding	Number of teachers needed, 1959-60	Average number of teachers per educa- tional facility needed
Public residential school	72	69	96	256	3. 71
Public day class	227	124	55	153	1.23
Public day school	10	10	100	44	4. 40
school	16	13	81	33	2. 53
Denominational and private day school and class	40	17	42	25	1. 47
Total	365	233	64	511	2. 19

¹ See the American Annals of the Deaf, vol. 104, No. 1, January 1959, pp. 111-149.

Information concerning the number of trained academic classroom teachers of the deaf required during the 1958-59 school year is presented in table II. In addition to the average number of teachers required in each educational facility, the percentage of schools and classes not able to fill their needs during 1958-59 is included. The reports from 233 educational facilities indicated that 516 classroom teacher were needed. This represents an average of 2.21 teachers for each. One hundred and eleven of the reporting 233 or 48 percent of these educational facilities were unable to fill their needs during that year.

Table II.—Number of trained academic classroom teachers of the deaf required, 1958-59

Type educational facility	Number reporting			facilities not able to	Percent educational facilities not able to fill needs, 1958-59
Public residential school	69 124 10	259 158 44	3.75 1.27 4.40	38 54 7	55 44 70
Denominational and private residence school	13	34	2, 62	4	31
Denominational and private day school and class	17	21	1.21	8	47
Total	233	516	2 21	111	48

Table III summarizes the average annual additional and replacement needs of academic classroom teachers of the deaf during the past 10 years and indications of expansion in the future. The average annual teacher needs during the past 10 years in public residential schools has been 3.06. Seventy-four percent of such schools indicated that their needs would increase in the future. Ninety public day classes provided data which indicated a need for an average of 1.56 teachers per annum during the past 10 years. Sixty percent of these classes indicated increasing needs for the future. The public day schools have indicated an average of 3.5 teachers needed annually during the past 10 years, and 90 percent indicated increasing needs for the future. Denominational and private residential schools suggested a need for 2.3 teachers per year, and 77 percent indicated that their requirements would increase. The average annual need for teachers in denominational and private day schools and classes during the 10 preceding years was 1.46. Eighty-eight percent of such educational facilities indicated increasing needs in the future. The total number of educational facilities indicating annual needs for the past 10 years was 186, and the average annual need per facility was 2.2. Sixty-eight percent of the total respondents (233) indicated that they would require an increase in the number of trained academic classroom teachers of the deaf due to future expansion.

Table III.—Average annual additional and replacement needs of academic classroom teachers of the deaf during the past 10 years and indications of expansion in the future

Type educational facility	Number reporting	Number indicating annual needs past 10 years	Average annual needs past 10 years	Number indicating increasing needs in future	Percent indicating increasing needs in future
Public residential school	69	63	3. 06	51	74
	124	90	1. 56	74	60
	10	9	3. 50	9	90
school Denominational and private residential school Denominational and private day school and class	13	10	2. 30	10	77
	17	14	1. 46	15	88
Total	233	186	2. 20	159	68

In summary, the information in tables I through III suggests that the 127 academic classroom teachers of the deaf graduating in June 1959, will not be sufficient to meet the demand for the 1959-60 academic year. The total number of trained teachers needed is 511. The average annual need per school or class during the past 10 years has been 2.2 teachers. Since 68 percent of the facilities indicated additional needs in the future, it is apparent that means must be developed for the recruiting and training of significantly greater numbers of qualified academic classroom teachers of the deaf.

Until the demand is satisfied, many schools, classes, and clinics are likely to utilize untrained public schoolteachers when it is not possible to procure trained teachers of the deaf. The necessity of inservice training has been a great problem but is now of paramount importance. The staff in schools and classes for the deaf cannot adequately train a number approaching 400 teachers a year while at the same time attempting to educate children in these same schools and classes. The implication, of course, is that the extent and quality of speech and language development and general educational achievement is likely to be less than that desired by those responsible for such training. These factors emphasize the need for trained teachers which, based upon figures in tables I through III, might be as high as 500 per year for the next several years.

Mr. Giaimo. Are there any questions by the members of the subcom-

Thank you very much for your testimony.

Mr. Knittle. Thank you. Mr. Giaimo. At this time we have about 5 minutes left. I understand that a member of the Connecticut Legislature, Robert T. Cairns, of Madison, is here.

Would you prefer to testify now for 5 or 6 minutes?

It is a pleasure to have you with us today.

STATEMENT OF HON. ROBERT T. CAIRNS, MEMBER, CONNECTICUT STATE LEGISLATURE

Mr. Cairns. Mr. Chairman, members of the committee, as a fairly long-time member of the Connecticut Legislature, I thought it might be proper to point out to you that in all of the fields covered by these bills under consideration, Connecticut has been a long-time pioneer and is still giving great thought to it.

In 1861 Dr. Galludet, with Federal and State assistance, started the American School for the Deaf. While it is a private institution we still support it statewide with capital appropriations and tuition

grants.

We also have Mystic Oral School, which is completely a State-maintained institution.

Oak Hill along with the Perkins Institute of Boston were pioneers

in the education of the blind.

In 1824, Dr. Ely Todd, with State assistance, started the Hartford Retreat, which was the first institution for mental health in the country. That took care of State patients until about 1952 or 1954, when we started our program of mental hospitals.

We now have three of them. All of them are accredited for profes-

sional training and I believe are outstanding institutions.

In 1859, Dr. Knight started the first school for mental retardates. In 1909 we started the Connecticut Colony for Epileptics, and in 1917 these two were merged into the Mansfield Hospital and Training School.

Subsequently we have built the school at Salisbury. These are two

of the outstanding schools of the country for mental retardates.

In 1957 we started the Child Study and Treatment Center in Camden, which I believe along with the Menninger Clinic is the first thing of its kind.

In 1955 one of the hospitals in New Haven, Grace Hospital, merged with New Haven and Yale, and the State took that over for purposes

very comparable to those contained in H.R. 3465.

We set up a pioneering program in the retraining or rehabilitation

of people incapacitated through illness or disease.

Unfortunately, the budget of the last session does not provide for the continuation of that institution and their work is to be split among several others.

However, it was a pioneering effort.

I might also point out that out of a biennial budget of around \$442 million, some \$85 million applies to the subjects of the bills before us: mental retardation, mental health, education of the deaf, the blind, and so on.

Thank you very much.

Mr. GIAIMO. Thank you very much, Mr. Cairns.

Are there any questions by the members of the subcommittee?

Thank you very much for your testimony.

At this time the subcommittee will recess until 1:45 this afternoon. (Thereupon, at 12:30 p.m., the subcommittee was recessed, to reconvene at 1:45 p.m., same day.)

AFTERNOON SESSION

The subcommittee reconvened at 1:45 p.m., upon the expiration of the recess.

Mr. Elliott. The subcommittee will be in order.

We will proceed now to hear additional witnesses. There are about 17 witnesses for this afternoon. So we must restrict each individual witness somewhat as to time.

Our first witness this afternoon will be Dr. Elias J. Marsh, chief of the Division of Community Services, Connecticut State Depart-

ment of Mental Health.

Dr. Marsh, will you come around, please sir?

Is Dr. Elias J. Marsh here?

Apparently he is not here.

So next we will hear Miss Virginia Cole, director of the Division of Service for the Blind, State of Vermont.

STATEMENT OF VIRGINIA COLE, DIRECTOR OF THE DIVISION OF SERVICE FOR THE BLIND, STATE OF VERMONT

Miss Cole. Mr. Chairman and members of the committee, as director of the Division of Services for the Blind, in the State of Vermont, I would like to present to this committee some of the unmet needs of the blind people in our State.

I have been a participant in the 2-day workshop held here and endorse the testimony being presented by this group, but I appreciate in addition this privilege of presenting briefly the needs of my State which I feel might be met through Federal Government assistance.

For background information, may I say that Vermont has a population of approximately 265,000 people, about 730 of whom are legally

blind.

Probably 430 of these are over 65; 220 are of an employable age,

and 80 under 21.

Because these numbers are relatively small this does not lighten the problems which must be faced by each individual blind person. The problems which lack of sight impose upon a person have the greatest variation in relation to the age at which blindness is present. I am therefore presenting these unmet needs on an age-level basis.

I have made a special effort to make this presentation brief.

(1) Preschool blind children: Skilled counseling services to the parents of preschool blind children are a must if normal development is

to take place.

In our experience in spite of good counseling, many preschool

children show evidence of additional abnormality.

This may be caused by mental retardation, lack of development due to blindness, emotional deviation, emotional disturbance, or brain damage.

At present we have no means of ascertaining the cost of determining such abnormality and no means of treatment. There is abject desperation on the part of the parents of these children due to lack of

resources for salvaging the potential of these children.

We, therefore, encourage Federal implementation of provisions for consultation, the training of the professional personnel and technicians and the establishment of diagnostic and treatment facilities on a regional basis which will help bring solution to this serious problem relating to multihandicapped children.

(2) School age children: It has been well proved that a blind child can be educated throughout his minority as adequately as a sighted child, but this is possible only through the provision of extras in all

phases of a child's education.

These extras are specialized, technical, and costly, many times over

and above many things needed for educating a sighted child.

In our experience in Vermont there is not enough of these extras to go around; we need consultation, technical training, equipment, and supplies over and above what we have funds to supply.

We, therefore, encourage additional Federal aid for the Office of Education, American Printing House for the Blind, the Library of Congress, and State education departments for additional consulta-

tion, training of personnel, and equipment and supplies.

Three, the employable age group: In working under Public Law 565, which provides for vocational rehabilitation we have found that certain restrictions of this law are a deterrent to successful rehabilitation.

These restrictions involve time limits beyond which operating expenses for business enterprises and client maintenance may not be federally reimbursed. Likewise, restrictions in title X of the Social Security Act relating to public assistance acts as a deterrent. These relate to the limited amount of earned income which may be disregarded in determination of economic need for public assistance and the limit in savings or equity which may be built up in a newly established business.

We, therefore, urge that these restrictions be relaxed in such a way that an employable blind person may be enabled to rise above a subsistence level of living in a more realistic and satisfactory manner.

In this age group we find that some persons have disabilities in addition to blindness to such an extent that they cannot expect to attain vocational independence. There is much that can be done, however, to assist them to adjust to restrictions imposed by blindness and to achieve a maximum independence in daily living.

We urge that Congress amend Public Law 565 to enable the States to provide this kind of independent living rehabilitation. We feel strongly that these are services for the blind which should be administered by whatever agencies are already administering vocational re-

habilitation for the blind.

Four, the older age group: Whereas upon occasion we provide vocational rehabilitation for a blind person who appears young and vigorous at 75, by and large blind persons over 65 are not seeking employment. The impact of the loss of sight, however, is felt just as keenly and the persons upon whom this calamity has befallen need and can profit by independent living services.

At present we are having to refuse requests for such service for

lack of funds.

We urge, therefore, that such independent living services as described for the previous age group not be restricted by any age limit.

In view of the increasing proportion of persons in our population who are over 65 and because blindness is incident with the disease of old age, such as diabetic renotroply, we strongly urge the support of Congress for any legislation directed toward research in the prevention of such diseases and of other causes of blindness.

Many of the problems related to these four age groups which arise from day to day are of State or local interest and are met adequately

or not according to the concern and capacity of the locale.

Constant study is needed on a Federal level for accumulating the best available knowledge toward strengthening and improving services in certain localities so that blind people of all ages in all parts of the country may expect and receive high-quality services directed toward their simulation in and contribution to society.

Thank you, gentlemen.

Mr. Elliott. Thank you very much, Miss Cole.

(The following material was submitted by Virginia Cole:)

[Excerpts from report of the department of social welfare]

SERVICES FOR THE BLIND

There were 135 persons referred to the division during 1956-57 as having become blind, and 154 during 1957-58. As of June 30, 1958, there were 700 names on the reigister of Vermonters known to be legally blind. This is the largest number in the division's history. The percentage of persons over 65 years shows a continual increase and it is in this age group that the incidence of blindness is on the increase.

Requests for funds for the coming biennium have been limited to the continuance of programs already in existence or started in the past biennium.

Mention should be made of two significant accomplishments in the area of services to Vermont's blind citizens. First, the pilot study on industrial homework which started in 1955 and was completed as of June 30, 1957 was considered successful enough to warrant its continuance under State financing. Its operation is being closely watched not only by the sponsoring agencies, the American Foundation for the Blind, National Industries for the Blind and the Office of Vocational Rehabilitation, but also by other States who are using the Vermont study as a guide to set up similar programs for homebound handicapped persons. Through its appropriation of \$20,000 the State has made it possible for 61 persons to engage in substantial remunerative employment. Thirty-six percent of these persons were blind, the other 64 percent having various cardiac, orthopedic, neurological, and miscellaneous disabilities which precluded their acceptance in the normal labor market. In the 1957-58 fiscal year, a total of \$21,512.46 was earned in wages by these 61 persons. The total cost of operating the program was \$18,990.60. This amounts to a cost of 88 cents per dollar earned. Thirty-nine of these workers gained one or more quarters of social security coverage. The public assistance grants of seven workers were reduced because of these earnings, and it was possible to terminate completely three of the grants. The total reduction of public assistance grants amounts to \$363 per month.

These three factors, significant earnings, social security coverage, and reduced public assistance support would seem to make the industrial homework program a sound investment for Vermont citizens, and it is hoped that in the coming biennium still more persons can be benefited. Acknowledgment should be made to those industrial concerns who have supplied the industrial homework office with subcontract work and have thus cooperated in making this new venture a success.

Secondly, mention should be made of a Federal vocational rehabilitation grant which enabled the division to remodel a building and purchase training and production equipment. Adequate quarters are now available for the industrial homework offices, and for a workshop for the blind, engaged in chair reseating, machine stitching, and whatever other suitable operations are found to be available. We are now able to expand production operations for Government contracts and the Skillcraft retail sales outlet, thus again increasing the opportunities for earned income for blind Vermonters.

The work in this division has by its very nature a great deal of visible and emotional appeal. It also has a utility aspect in creating areas of usefulness for those who were once almost forced to sit in darkness. Total sales of blindmade articles was \$7,852.30, but it represents much more than dollars and cents. Much emphasis is today placed on rehabilitation. I am sure much interest and pleasure can be derived from a study of the industrial homework project. Vending stand operations earned a gross of \$44,396.52 and a very satisfactory net during the fiscal year. It is hoped to establish two new stands in gainful locations.

[Vermont Department of Social Welfare, Division of Services for the Blind]

Staff: Miss Virginia Cole, director; Mr. D. Kenneth Morrison, supervisor of rehabilitation; Mrs. Margaret C. Lyon, supervisor of special services; Mr. Robert D. Peakes, workshop manager; Mr. Howard Walbridge, rehabilitation counselor; Mrs. Christine Jeffrey, office manager; Mrs. Eloise B. West, account clerk; Mrs. Norma S. Morgan, secretary; Mrs. Alberta Ducharme, clerk;

PROGRAM

Funds are appropriated by the State legislature for the administration and case services of the division. Federal funds are available for the vocational rehabilitation program.

The purposes of services for the blind is to provide opportunities for blind Vermonters to become or continue to be useful, productive members of their homes and communities, and to lead normal and happy lives. An attempt is made by means of the press, radio, and public talks to enlighten the public as to the fact that a person does not lose his ability when he loses his sight, that countless activities can be performed without the use of eyesight, and that blind persons wish to be treated in a direct, normal, everyday manner by their well-meaning, but sometimes overprotective, sighted friends.

The Division of Services for the Blind maintains a register of the blind, furnishes adjustment services, talking-book machines, home industry, medical care, help for parents of blind children, guidance for school-age children, and vocational rehabilitation.

The division has been awarded the Seal of Good Practice by the American Association of Workers for the Blind.

Eligibility for blind services

To be eligible for services from the division, there are the following requirements:

- 1. Vision.—A person must have as little as 20/200 in the better eye with correction, or a limitation in the fields of vision to be at least 20°. This is to be determined by an opthalomogist.
- 2. Age.—There is no age limit, and clients range in age from infants to those in their nineties.
- 3. Residence.—A person must be residing in the State with the intention to remain.
- 4. Economic need.—Is not determined, except for certain services in the State-Federal vocational rehabilitation program.

Request for service

Requests for service may be made at the State office of the Department of Social Welfare, Montpelier, Vt. The following pages describe these services of the division in some detail.

REGISTER OF BLIND PERSONS

State legislation authorizes the Department of Social Welfare to maintain a register of all known blind persons. This register is maintained on a card file, and contains pertinent information including birthdate, amount of vision, diagnosis, cause and prognosis of eye defect, economic and occupational data, and a summary of services provided.

Such a register is useful for ready reference and for statistical information

which might be used in the prevention of blindness.

Confidential information

Any information received in the Division of Services for the Blind, either recorded or unrecorded, is held to be confidential.

MEDICAL CARE FOR THOSE WHO ARE IN NEED

Blind persons do not escape other disease and illness. Doctors, hospitals, and drugs are costly, but are needed by all in order to maintain good health. These services are furnished by the department to the extent that funds are available.

HELP FOR PARENTS OF PRE-SCHOOL BLIND CHILDREN

Advice, encouragement and information are given to parents of preschool blind children, so that they may have a normal, healthy development. Mothers are encouraged to attend Institutes for the Pre-School Blind Child. The department pays the costs of institutes, evaluation, and nursery equipment when parents are unable to do so.

EDUCATION FOR SCHOOL-AGE CHILDREN

The department cooperates with the Division of Special Education in making a sound individual educational plan for each child according to his needs and abilities.

Adjustment services for all

Blindness places upon a person certain restrictions which result in frustration and inactivity. These restrictions include limitation in range and variety of concepts, inability to get about, environmental detachment and arrest of the growth process. To overcome these restrictions and make acceptance of the handicap possible, personal adjustment is provided by whatever means seem most expedient, including any or all of the following:

New tools and gadgets.—These include ordinary household activities such as marked rulers and tape measures, markers for canned goods, clocks, watches and kitchen timers, other kitchen aids, writing boards, braille writers, carpenters'

tools, and many other items.

Reading and writing.—Instruction is given in reading and writing braille, use of guideboards for longhand, checkwriting, typewriting, and use of talking-book machines.

Traveling.—Instruction is given in the proper use of the cane, making arrangements for guide dogs, walking with a human guide, importance of listening and muscular memory.

Sense training.—Development of other senses such as hearing, touch, smell, and memory is important.

Hand training.—Hand training is provided for the making of simple useful household articles and repairs.

Recreation.—The newly blinded person is encouraged to continue his recreational activities and add new ones.

Personal care.—Help is given with good grooming, table etiquette, introductions, handling of money, and many other problems of daily living.

Psychological adjustment.—The newly blinded person is helped to face his limitations realistically and to understand the attitudes of sighted persons toward him, so that his frustration will be minimized to the greatest extent possible.

HOME INDUSTRY FOR THOSE WHO ARE HOMEBOUND

Blind persons with manual ability are assisted in designing, producing, and marketing salable products. Supplies are purchased by the department so that quality materials may be had at quantity prices. These materials are sold at cost to the homeworker, and instruction is provided in their fabrication. Finished articles, if salable, are purchased from the client by the department which then becomes responsible for their retail sale. Clients are paid for their labor on a monthly basis. This program provides encouragement and partial financial independence. It may be an end in itself or may be a step in the vocational rehabilitation process.

The department uses a variety of outlets in its sales program. Articles are placed on a consignment basis in many gift shops throughout the State. It seeks cooperation from women's clubs, Granges, PTA's, church groups, and other organizations which spousor annual sales. Some are sold through regular retail channels. In any case, a 25-percent commission is available for the seller. Blind persons are encouraged to sell their own products, in which case they receive the 25 percent commission.

The department is affiliated with National Industries for the Blind, and Skilcraft, Inc., both of which provide outlets of a wholesale nature through Government orders and a retail sales program with headquarters in Rochester, N.Y.

TALKING-BOOK MACHINES FOR THOSE INTERESTED IN READING

Undoubtedly, the most appreciated single item available for blind people is the talking-book machine. These machines are manufactured by the Federal Government, and distributed to State agencies, who, in turn, lend them to blind persons. The New York State Library in Albany serves the readers of Vermont. The variety and quality of recorded books is extremely good. The records are mailed in a special mailing carton, free of charge. No blind person, who is interested in reading, should be without one of these talking-book machines.

VOCATIONAL REHABILITATION FOR THOSE WHO ARE POTENTIALLY EMPLOYABLE

In this program practically any service is available if it will increase the person's ability to work for pay. These services include:

Vocational counseling.—A thorough evaluation of the person's skills and abilities is made, and guidance provided to determine a suitable vocational goal.

Physical restoration.—Eye, general, and specialty medical examinations are provided; and surgery, medical treatment, hospitalization, and prosthetic appiances may be furnished as found needed. Optical aids are available for persons whose low vision can be improved by some kind of magnification.

Training and equipment.—The department furnishes training, maintenance, transportation, occupational licenses, tools and equipment, job placement, and followup. Training may include institutional, on-the-job, tutorial, correspondence, or personal adjustment. Equipment provided in this manner remains the property of the department, but is designated for the use of the client as long as it is needed by him to gain some financial return.

Supervised business enterprises.—The department develops employment opportunities which are managed by blind persons under supervision. To date these enterprises have been limited to vending stands in public buildings including Federal buildings.

Economic need

For this vocational rehabilitation program, economic need must be established for all services except examinations and counseling.

Source of financing

The Federal Government pays 65 percent of the cost of administration and of the cost of case services for the client with the State paying the balance of such expenses.

Employment opportunities

Employment opportunities include a wide variety of occupations. Blind Vermonters have been engaged in the following as a means of support: Law, ministry, teaching, piano tuning, stenography, insurance, storekeeping, dairy and poultry farming, chair-reseating, telephone operating, taxicab dispatching, housework, electrical repair, janitor service, dishwashing, plumbing, vending

stand operation, lunch-bar operation, many types of industrial work, and many types of home industry.

In spite of this variety, employment opportunities for blind Vermonters are extremely limited. There is great need for more openings.

The general public should know that it is ability, not disability, that counts, and be more willing to accept and have faith in the abilities of blind persons, so that these physically handicapped people will have a chance to show that they, too, have something to give.

The Braille dots on the front cover were transcribed by a blind person, and say:

"Obstacles are things to be overcome."

Mr. Elliott. Our next witness here is Mr. Kenneth Shute, director of vocational rehabilitation, New Hampshire Department of Education, Concord, N.H.

STATEMENT OF KENNETH SHUTE, DIRECTOR OF VOCATIONAL REHABILITATION, NEW HAMPSHIRE DEPARTMENT OF EDUCA-TION. CONCORD. N.H.

Mr. Shute. Mr. Chairman and members of the committee, thank you very much for this opportunity to present this statement for our commissioner of education, Charles F. Ritch, Jr.

Mental retardation: New Hampshire has 22 classes at the public school level in 9 of the 48 supervisory unions for the education of the

educably retarded child.

A conservative estimate of additional class need in the educable range alone would be 58. There are no classes at the public school level for the education of the trainable child—New Hampshire presently has a permissive law on the statutes in this area.

2. Speech and hearing: New Hampshire State law requires the

State department of education to—

prepare, develop, and administer plans to provide educational facilities for the deaf-

including the severely hard of hearing child—above the age of 5 years. Here, again, available funds limit the extent of this program.

3. Neuromuscular and orthopedic: Children who are identified as physically handicapped—by statute—may with the approval of the State board of education, attend public or private school, for the training of such handicapped children, tuition, not to exceed the State average, to be borne by the school district wherein the child resides

By additional statute a child who is capable of such instruction in the event that he is not attending such a school as outlined aboveshall be instructed in his home for a minimum of 2 hours per week.

The types of children for whom this specialized help is needed includes the epileptic, spastic, and cerebral palsied, among others.

The minimum of 2 hours per week of home instruction in no real sense meets the individual educational needs of such children.

4. Emotionally and mentally ill: New Hampshire has five outpatient clinics, public and private, which work with emotionally handicapped children. One problem in this area concerns the lack of adequately trained personnel, since the range of salaries offered to professional persons is lower than the national minimum for such salaries.

A second major problem is that there are no facilities for in-patient counseling of children within the State, such child patients requiring institutionalization with adults at the State hospital level.

The number of clinics available in the State by no means meets the

need for such clinics.

5. Gifted: Although the National Defense Education Act of 1958 provides funds under titles III and V to assist in the education of academically gifted children, many needs are yet to be met at this level which are not being met under existing fund appropriations—with a grant from the fund for the advance of education a program of advanced studies has been operating at a private boys' school for the past 2 years. Experience with this program has indicated the educational depth that can be offered to children at this academically gifted level when funds are available.

Information available, however, would indicate that such a program

cannot continue indefinitely without additional funds.

6. Visually impaired: Although the State has within its welfare department a division of blind services, this division works with the legally blind, which may or may not be totally blind.

Another division of that same department works with the visually handicapped, those who are not considered or designated as legally

blind.

The State department of education, through Federal subsidization, provides sightsaving materials for educational purposes, but only to the legally blind.

There is need of coordination of blind services, with additional

funds to finance these services.

7. Special medical problems: Among the special medical problems are the cardiacs and diabetics who require special help, but who are presently unable to receive the necessary assistance under our present financial structure.

This office is not familiar with the many medical problems which would be apparent under this specialized area, other than to feel that these specialized problems require the same type of financial aid

which is evident in the other problem areas listed above.

Specific recommendations: New Hampshire's needs fall into two broad areas:

broau areas

First, there is a need for additional services for children who have specialized educational needs.

The basic problem here is financial. With additional support, local

and regional programs of special education would be possible. Secondly, there is a need for further leadership at the State level.

Financial support for a director of special education would make it possible to meet that need.

Unmet rehabilitation service needs in New Hampshire:

1. Payment of social security disability insurance has uncovered a large group of people, predominantly in the lower economic group, who present a very difficult vocational rehabilitation problem.

In New Hampshire experience this group presents a need for a great deal of physical restoration and other independent living rehabilitative services of the type represented in H.R. 3465, provision of which would not necessarily lead to a job.

In the absence of a definitive survey, we offer the opinion, based on our experience, that such rehabilitation services for this group out-

weigh vocational rehabilitation service 4 to 1.

It is recommended that the Congress institute sizable pilot projects to measure more precisely these rehabilitation needs in terms of people and dollars.

It is also recommended that independent living legislation of the type of H.R. 3465 house the activity in the vocational rehabilitation agency, and that this agency be directed to give a high priority to social security disability applicants.

It is further recommended that the Federal laws governing all types of rehabilitation programs be studied with the objective of

consolidating as many as possible into one program.

2. The Congress has already recognized the value of comprehensive rehabilitation centers by grant-in-aid funds for their construction.

H.R. 3465 proposes to extend similar support to establishment of sheltered workshops. It is urged that Federal subsidies not exceeding \$10,000 per annum for each sheltered workshop be authorized in order to insure that a given workshop might make a firm demonstration

of its worth to its area.

The OVR—office of vocational rehabilitation—publication Workshop for the Disabled, indicates that the sheltered workshop potential is 1 percent of our population. This would indicate a need for workshop facilities in New Hampshire to service 5,600 people. Six sheltered workshops, located in major population centers in New Hampshire, employing 30 disabled workers each, are recommended as a basic minimum for this State.

3. It is an unusual college which has a physical plant so designed

as to permit attendance by a severely disabled person.

It is recommended that the Congress take appropriate steps to insure the presence in each region of at least one accredited degree granting institution which would have necessary living and instructional facilities appropriate to a severely disabled student.

Mr. Elliott. Our next witness is Dr. Elias J. Marsh, chief of the division of community services, Connecticut State Department of

Mental Health.

Dr. Marsh, it has become necessary that we put a time limitation of 10 minutes. With that understanding, sir, you may proceed.

STATEMENT OF ELIAS J. MARSH, CHIEF, DIVISION OF COMMUNITY SERVICES, CONNECTICUT STATE DEPARTMENT OF MENTAL HEALTH

Mr. Marsh. Thank you very much, Mr. Chairman and other members of the committee. I understand this and I believe I can make my statement quite short.

I am interested in not any specific bill, but in the general problem as you presented it at the opening session this morning, Mr. Chairman.

The great majority of children of school age regardless of whether or not they are enjoying some abstract ideal of perfect health are able to use any school program that provides the range of subject matter and the type of curriculums that progressive educators are now developing.

However, there are many exceptions who for one reason or another cannot adapt to the regular program as offered and for whom special program adjustments must be made or special services provided so that they may achieve the maximum educational benefits of which they

are capable.

These exceptions include some, but by no means all, of the children with orthopedic or neuromuscular speech, mental, visual, intellectual, or emotional defects, defects of such degree of severity as to interfere with their adequate functioning in school.

This is a point particularly to be emphasized since a defect that does not interfere with a child's functioning in school is not a handicap in the present context and hence is not of immediate concern to us.

I believe that unless we are looking forward to a completely paternalistic state it is no real concern of school authorities that a child has cavities in his teeth, enlarged tonsils, or, for example, is a chronic bedwetter.

A start has been made to provide special programs for certain kinds of handicapped children, especially those handicapped by virtue of orthopedic or intellectual difficulties, the classic crippled children's

programs and special classes for the mentally retarded.

There is an unfortunate tendency on the part of various groups to seek for more special programs for children with other kind of handicaps. Although these children do require special attention and program adjustments, it is highly dubious that each kind of handicap requires its own special program.

There are variations in adjustments that must be made in details, but these must be provided by the local school authorities in accordance

with the requirements of the local situation.

I believe that Federal assistance for special educational programs for handicapped children is indicated; not support, but assistance.

I believe this is an important distinction.

We in Connecticut have been very happy with the stimulating seeding effect that the relatively small Federal grants for community health programs have had. The great beauty of these grants has been the freedom within broad prescriptions left to the States in the specific operation of these programs. They are small, less than \$50,000 a year

to Connecticut, but have had tremendous impact.

With these things, for example, we have been able to try out programs of assistance, mental health programs in school systems, aid to psychiatric clinics for children, with a freedom that would not be permitted to us from any other source, which have demonstrated the effectiveness of these programs and in a number of instances we have been able to find other sources of ongoing, continuing support for carrying these on.

This is a pattern of Federal support that I believe is thoroughly

justified.

I believe a program of grants-in-aid for the development of special educational services for handicapped children of all kinds could have similar value, but the grants should have a broad base and not be made by specific category of handicap.

I believe that others this afternoon will speak on the special problems of recruitment and training of the specialized personnel in which

Federal assistance would be valuable.

We discussed this in the workshops yesterday and the day before and I won't touch on that.

Although I am against special categorical grants, I would like to make a special plea that there be no error in any legislation that is finally made that might exclude special programs or special educational services for the mentally or emotionally disturbed child.

Mr. Irons, of Vermont, made this comment this morning, urging that the word "physically" be deleted from the President's Commission on the Physically Handicapped so that it becomes not the President's Commission on the Physically Handicapped, but the President's Commission on the Handicapped. This is the same sense that I am endorsing right now.

Although I am a child psychiatrist, I do not want to plead for special categorical assistance for the emotionally disturbed child, but I would like to make sure that any assistance that is given for programs not

exclude the emotionally disturbed child.

I am aware of the fact that this label is one that has caused a lot of confusion to a great many people, emotionally disturbed child, so I would like to offer a word, not of definition, but of explanation.

Let me make a comparison with a child with rheumatic heart disease for whom special curriculum adjustments must be made. The significant factor for the school authorities is that he must be handled a bit specially. The school authorities accept the medical diagnosis of heart disease and the determination that he needs a special program, but they are not concerned with a definition of rheumatic heart disease; with its etiology, pathology, or the technical details of its diagnosis.

So also with the mental and emotional disorders of children.

Details of etiology and pathology, techniques of diagnoses are the concern of the psychiatrist and his specialized colleagues.

The school authorities come into the picture when the diagnosis and

the determination of the handicap have been made.

For a start at a working definition, and I emphasize a start, I

would offer the following:

For the purpose of developing special educational programs of services, emotionally or mentally disturbed children are those children who are suffering from an emotional or mental disorder to such an extent as to require a special school program either in their own interest or in the interest of other schoolchildren.

I emphasize particularly that not all emotionally disturbed children require special educational services and for this reason there is no call to try to define in detail what emotional disturbance is, a child whose emotional disturbance is evidenced chiefly by repeated night

terrors might require no special program at all.

Likewise a bedwetter. Both of these would probably be considered emotionally disturbed by any authority in the field, but they are not

school problems.

On the other hand, a child whose fears make it impossible for him to leave his mother's side so that he can't go to school is a real school problem. It is necessary to have a medical determination that the child's problem is the result of emotional disturbance, but that having been done, details of the diagnosis and so forth are of no concern to the school authorities.

The provision of home instruction on the other hand is. I could

give other examples, but I think I have made my point.

A definition of emotional disturbance is no more necessary to our purpose than a definition of rheumatic heart disease, diabetes, or myo-

atrophic lateral sclerosis.

What is important is that once the medical diagnosis and determination of handicap has been made, the handicapped child, whatever the nature of his handicap, mental, emotional, or physical, requires special educational services or programs.

I believe that the Federal Government can appropriately assist the

States to develop such special educational programs.

Mr. Elliott. Thank you very much, Doctor.

Are there any questions?

Mr. Marsh. Thank you, Mr. Chairman.

Mr. Elliott. Our next witness is Mrs. Ruth Winer, president of the Massachusetts Association for Occupational Therapy.

Is Mrs. Winer here?

STATEMENT OF RUTH WINER, PRESIDENT, MASSACHUSETTS ASSO-CIATION FOR OCCUPATIONAL THERAPY, DIRECTOR OF OCCUPA-TIONAL THERAPY, BETH ISRAEL HOSPITAL, BOSTON, MASS.

Mrs. Winer. In the State of Massachusetts, overall, in all areas covered by occupational therapists, there is an acute shortage of personnel.

In the department of mental health, alone, of 112 available posi-

tions, 75 are vacant or filled by untrained personnel.

The services of the occupational therapist are being expanded, for example, to include training of physically or mentally disabled housewives in homemaking activities by the development of shortcuts in individual housekeeping problems and by the use of splints and gadgets when advisable in order to make the disabled housewife independent.

In working with the mentally retarded, occupational therapists have been found to be the best teachers for these handicapped children, but, out of 30 job openings in Massachusetts, only 1 has been

filled.

As job demands increase, the number of students entering training schools continues to fall. As I see it, we are approaching an emergency situation.

People are also leaving the field of occupational therapy. It is not

appealing enough to them.

We are dealing with a new field, comparatively, and although the old idea of work versus idleness as a requisite to a satisfactory life is an accepted one, modern concepts of occupational therapy as a scientific approach are not understood by everyone.

A vigorous educational program must be instituted. Rehabilitation procedures should be taught to people in the schools and to the

I don't mean medical people. All of these things that people have talked about here today are not going to really have a good foundation unless basically the public is educated in the technique of rehabilitation.

All these needs that people talk about here today are needs because we are not educated. Even the people here are not educated. Local recruitment endeavors must be financed and initiated. Scholarships and fellowships must be increased.

Finally, the profession of the occupational therapist must be given

dignity

Mr. Elliott. You say people are leaving the profession now be-

cause of low salaries?

Mrs. Winer. Yes, for the very reason we are not considered professionally on a very high side. We are sort of looked down on. We are treated as volunteers in a lot of hospitals.

I am frequently asked if I am a volunteer. The salary is terrible.

Training is lax.

All of these fields that people come from here today need occupational therapists.

Mr. Elliott. Thank you.

(The formal statement submitted by Mrs. Winer follows:)

STATEMENT BY RUTH WINER, BETH ISRAEL HOSPITAL, BOSTON, MASS.

Within my own experience I am involved in the field of rehabilitation in two capacities:

I. AS DIRECTOR OF THE OCCUPATIONAL THERAPY PROGRAM IN A GENERAL HOSPITAL IN A LARGE CITY

In such a hospital, physical medicine is concerned with two conditions—temporary, with convalescing patients, and long range, with permanently disabled individuals. This requires both an inpatient and outpatient program as

well as treatment for patients on home care.

In order to achieve optimum results the combined efforts of all those involved with the patients are necessary. I find treatment most effective when each person has a sound awareness of the function of every other person concerned with the patient's care. Too frequently this is lacking as far as occupational therapy is concerned. It seems to me a more clearly defined concept of the occupational therapist, her procedures, techniques, and goals needs to be developed and education in this area considerably improved as far as anyone having anything to do with rehabilitation is concerned. This should include nurses, social workers, psychologists, doctors, medical students, families, and

even occupational therapists, themselves.

For example, a patient with heart disease was admitted to the hospital, having fractured her hip. She was put to bed and informed that it would be several months before she could stand on her leg. A week following admission, she developed a blood clot in the injured leg and became very frightened and depressed. This not only served to aggravate her condition but presented a problem to the doctors and nurses as she became complaining, demanding of their attention, and generally difficult to manage. When occupational therapy was prescribed for this lady, the goal was to relieve her tension through the visits of the therapist and occupation of the patient's time with learning a new craft. She was taught to make a variety of small stuffed toys for her various nieces and nephews. After about 10 days, the change in her disposition was noticeable. As she became more and more absorbed with her work she grew less and less absorbed with herself. As she relaxed she became less agitated. In 2 weeks she improved sufficiently to be discharged to a nursing home.

A hospital stay can be shortened and patients can be helped to become more manageable, but all too frequently there is a failure to recognize this concept.

Outpatients may present different problems. Perhaps the goal is to return a partially paralyzed person to work. Sometimes, an overprotective or unenlightened family neglects to help the patient keep his physical medicine appointments. A social worker may miss the importance of attending immediately to such things as ordering leg braces which will assist the patient in learning to walk when these are prescribed by the doctor. The patient becomes discouraged and fails to make progress in all other areas.

Some patients simply cannot pay the fees required in lengthy treatment or for special equipment such as artificial limbs.

II. AS PRESIDENT OF THE MASSACHUSETTS ASSOCIATION FOR OCCUPATIONAL THERAPY

In the State of Massachusetts, overall, in all areas covered by occupational therapists, there is an acute shortage of personnel.

In the department of mental health, alone, of 112 available positions, 75 are

vacant or filled by untrained personnel.

The services of the occupational therapist are being expanded, for example, to include training of physically or mentally disabled housewives in homemaking activities by the development of shortcuts in individual housekeeping problems and by the use of splints and gadgets when advisable in order to make the disabled housewife independent. In working with the mentally retarded, occupational therapists have been found to be the best teachers for these handicapped children; but, out of 30 job openings in Massachusetts, only 1 has been filled.

As job demands increase, the number of students entering training schools continues to fall. As I see it, we are approaching an emergency situation,

We are dealing with a new field, comparatively, and although the old idea of work versus idleness as a requisite to a satisfactory life is an accepted one, modern concepts of occupational therapy as a scientific approach are not understood by everyone.

A vigorous educational program must be instituted to reach anyone having to do with rehabilitation, in the hospitals, in the schools, and in the community. Local recruitment endeavors must be financed and initiated. Scholarships and fellowships must be increased, and finally the profession of the occupational therapist must be given dignity.

We will continue to lose valuable people from a field where they are becoming

a necessity unless specific measures are taken to reverse the situation.

Mr. Elliott. Our next witness is Martha Jayne, dean of the College of Nursing, Bridgeport, Conn.

STATEMENT OF MARTHA P. JAYNE, DEAN OF THE COLLEGE OF NURSING. UNIVERSITY OF BRIDGEPORT

Miss Jayne. Mr. Chairman and members of the committee, I am testifying for our president, James H. Halsey, of the University of

Bridgeport.

The University of Bridgeport is a rapidly growing, private, community center, urban university. In the University of Bridgeport are the colleges of education and nursing, whose faculty are aware of the pressing need for more adequate services of special education and rehabilitation.

I have served on the executive committee of the Greater Bridgeport Health Survey. A study, conducted this past year by the American Public Health Association, was made of this community, whose popu-

lation is over 275,000.

I have also served as the chairman of the study of public health nursing. A three-volume report was published of the health survey. One section in volume 3 was devoted to rehabilitation. However, the need for rehabilitation services and education was evidenced in all three volumes. An active committee of city and university persons are working to formulate a plan to meet these demonstrated needs.

Grants-in-aid and traineeships are needed to provide a coordinated

educational and community service program.

Thank you, Mr. Chairman.

Mr. Elliott. Thank you very much for your testimony, which I am sure our full committee and all of us will find to be most helpful.

Miss JAYNE, Thank you.

Mr. Elliott. Our next witnesses are Mr. George Morrison and Mrs. Margaret M. McNally. Mr. George Morrison is president of the Massachusetts Parents Association for Deaf and Hard of Hearing, and Mrs. McNally is corresponding secretary for the Massachusetts Parents Association for Deaf and Hard of Hearing. They will appear together at this time.

You may proceed.

Is Mrs. McNally present?

STATEMENT OF GEORGE MORRISON, PRESIDENT, MASSACHUSETTS ASSOCIATION FOR DEAF AND HARD OF HEARING

Mr. Morrison. She is present. I will speak for both of us.

Mr. Elliott. You go ahead, Mr. Morrison.

Mr. Morrison. It struck me as particularly appropriate this morning while listening that this committee was hearing testimony on legislation of this type because it is highly unlikely that any of you would be enjoying your present positions were you not able to hear and communicate freely.

You have heard testimony this morning and this afternoon. You will hear more from expert witnesses who will give you facts and figures. They have titles. I have no title. The one title, though, that I do have which allows me to speak here is the word "daddy."

I am a parent of a deaf child and president of the Massachusetts Parents Association for the Deaf and Hard of Hearing, an organization representing well over 1,000 parents of school-age children in the State of Massachusetts.

We know that given a good education our deaf children can and will be useful, productive citizens who will reflect great credit upon

themselves, their communities, and their country.

An enlightened and well-educated citizenry is the bulwark of our defense against alien philosophies and the surest means of assuring to ourselves and our posterity continued economic and social growth in this, our land of freedom.

If more were done for those with hearing losses, their social and economic contributions would add immeasurably to the happiness

of all

The millions whose lives are distorted by the handicap of impaired hearing constitute an enormous potential reservoir of human energy and talent which at present lies dormant and untapped. The horizons are limitless and the search continues for all deaf people to reach their

full potential.

In a country such as ours, whose overall educational system guaranteeing an education to all children regardless of race, creed, or color, is the envy of the entire world, it is inconceivable to me that we should keep the door closed to such a large segment of our children by not giving them the education which will enable them to stand shoulder to shoulder with their hearing peers.

What do we, as parents, want? We want more fully trained teachers of the deaf. We want enough teachers of the deaf so that no deaf child need be denied an education. We want our children educated

so that all will be able to work up to their fullest capabilities encom-

passing all forms of endeavor.

We say give them this good education so that they in turn may go on to honest, gainful employment and higher education and by so doing bear out the wisdom of the Congress of the United States in passing this legislation.

Recently, President Eisenhower, in addressing the Parliament in India, spoke of governments being burdened with "sterile expendi-

tures" for military developments.

Embodied in this bill, under advisement, is the exact antithesis of such barren expenditures. Here is a fertile field, here is an opportunity, rare indeed, for our Government to enact legislation which is ennobling and uplifting.

We feel very strongly that the passage of this bill will help to overcome the critical shortage of properly trained personnel. To the teachers of the deaf, we as parents owe a deep debt of gratitude. Help

us to help them train our children.

This is not a inanimate piece of legislation which we are assembled here to plead for. This is a living, vibrant cause to uphold the dignity of man in his everlasting search toward a life free of fear and want, clothed in the mantle of dignified, honest endeavor.

Mr. Chairman, speaking for all parents, everywhere, thank you very much for giving me this opportunity to say what is in the hearts of

all of us.

Thank you.

Mr. Elliott. Thank you very much for your testimony this afternoon, Mr. Morrison.

Our next witness is John F. Mungovan, director, Division of the Blind, Department of Education, State of Massachusetts.

Mr. Mungovan.

STATEMENT OF JOHN F. MUNGOVAN, DIRECTOR, DIVISION OF THE BLIND, DEPARTMENT OF EDUCATION, STATE OF MASSACHUSETTS

Mr. Mungovan. The Massachusetts Division of the Blind is a division of the State Department of Education. This division administers comprehensive services to blind and partially sighted persons of the Commonwealth. The services administered by the Massachusetts Division of the Blind are:

1. Aid to the blind. This is a form of financial assistance extended to 2,200 needy blind persons under the provisions of title X of the

Social Security Act and pertinent Massachusetts law.

2. Vocational rehabilitation. Services to about 300 blind persons

a year.

This program is financed under the provisions of Public Law 565 and State funds. Currently about 70 individuals a year are rehabilitated; that is, retrained and placed into jobs.

This program is still growing in Massachusetts.

3. Home teaching services. This is a State supported program providing instruction to about 600 recently blinded adults each year.

This instruction consists of teaching certain tactile skills such as braille, typing, some handcrafts, and some activities of daily living.

This program frequently provides the newly blinded adult with his

first step toward his rehabilitation.

4. Talking book services. This is a reading service provided by the Library of Congress. The division of the blind issues, stores, and repairs the talking-book machines and pays the regional depository of the Library of Congress—Perkins School for the Blind—a fee for handling and storing the records for the 2,000 Massachusetts readers.

5. Sheltered workshops. The division also administers an industrial aid program through the operation of six sheltered workshops

employing 110 blind persons.

These are terminal type shops and not rehabilitation centers. They provide work in a protected atmosphere for those who are not able

to complete in the world of the sighted.

6. Services to blind and partially seeing children. These services, supported entirely by State funds, include a counseling service to parents of preschool visually handicapped children and social casework services to school age visually handicapped children and their parents.

Children's workers are active with approximately 200 visually

handicapped children of Massachusetts at any one time.

7. Register of the blind. Besides the direct service programs already mentioned, the Massachusetts Division of the Blind maintains

a register of all blind persons in the Commonwealth.

About 8,200 blind persons are registered at this time. The registration is accomplished under a law which requires physicians, clinics, and optometrists to report to the division of the blind whenever a patient suffers sufficient loss of vision to render him legally blind.

8. In addition to all these services offered by the division of the blind, the Division of Special Education of the Massachusetts Department of Education provides educational supervision of school

age visually handicapped children.

Thus, it can be seen that a complete range of services is made available to blind persons of Massachusetts through the services of

this department.

The register of the blind, maintained at this division, is helpful in indicating both current and future demands for services to the blind. There was a total of 8,204 persons on the Massachusetts register on June 30, 1959.

During the 12 months ending June 30, 1959, there were 874 persons added to the register. About half of the persons registered as blind have no sight, and about one-half have partial sight, although listed

as blind according to the legal definition of blindness.

Also, about one-half of all the persons registered are over age 65. Children, that is, those persons under age 20, amount to about 11

percent of the registration.

The current trend, and I presume the trend to be expected in the future, is a gradual reduction in the number of children registered because of the control of retrolental fibroplasia and a constant increase in the aged group due to the increasing span of life.

We hope that radiation and its effects does not cause another in-

crease in blindness in children.

Thus, the three major areas of concern in planning programs for the visually handicapped and blind, are these:

1. An increased emphasis on programs to help the aged blind.

2. An increased emphasis on providing educational facilities for blind children during the next 15 years.

Although we can expect a gradual decline in the congenitally blind, the large number of children born blind between the years 1941 and 1956 need to be educated and prepared for a life of independence wherever possible.

3. The middle age group between the ages of 20 and 65 is confronted with the most serious problem of adjustment to blindness, retraining and reentering the labor market in order to seek self-

With these broad estimates of the areas of need for the future in mind, I would like to present to your committee, Mr. Chariman, some recommendations as to how these needs might better be met as viewed

by the Massachusetts Division of the Blind:

1. Factual background. While a register of the blind is maintained in Massachusetts, I believe much more could be done in measuring the amount of blindness in the United States and in identifying and measuring the needs of blind persons on the one hand, and on identifying and measuring the needs of partially sighted people on the other hand.

Much work needs to be done to define blindness and to provide programs for blind people and it is of equal importance to do the

same for persons with poor vision.

The present programs as organized under the commonly accepted definition of blindness fail to make this distinction. This grouping together of blind and partially sighted persons tends, I observe, to work to the disadvantage of the most severely handicapped group; namely, the blind.

I recommend that a careful statistical study be made nationally of the incidence of blindness and the incidence of partial sight and that this study classify blind and partially sighted persons by age, sex, cause of blindness, and vocational potential and the goals of these

blind and partially sighted people.

It is not sufficient for program planning purposes to work on an estimate that there are 300,000 blind persons in the United States without describing more accurately who are these blind people.

Data available in Massachusetts could be a stepping stone to such a study, although the Massachusetts Division of the Blind is not staffed

in such strength as to assume such a study on its own.

2. Education. Young blind people and partially blind children are now receiving education in residential schools for the blind and in

public, private, and parochial schools throughout the State.

Because of the diversity of textbooks used in this variety of schools, a much larger quantity of braille material and other educational aids is needed. Support for an expanded service of individualized books transcribed into braille or on to discs or into large type is needed desperately by school children.

Some provisions for increasing the reader services for high school students is needed despite the wonderful work being done by a very

large number of dedicated volunteers now doing this work.

The use of professional readers in educational plans beyond high school is a necessity and is just as much a part of the cost of education as is the cost of tuition, yet the rules of the Office of Vocational Rehabilitation in Washington place reader services as a service to which a means test must be applied but, on the other hand, does not require a means test to determine eligibility for the payment of tuition.

I would urge, therefore, that the office of Vocational Rehabilitation change its regulations so that the means test as an eligibility factor for students engaged in higher education who employ readers, be

eliminated.

Considerable scrutiny should be given to the educational service provided by our State schools for the mentally retarded. A substantial number, 27 percent, of blind children are resident in these schools. The provisions for teaching blind children in these State schools could improve considerably with Federal help.

Probably the most important and the most basic skill to be learned by a blind person is the skill of mobility. Mobility training should

be an integral part of the education of all blind children.

It is equally necessary to include mobility training in the rehabilitation of newly blinded adults. The skill of teaching mobility is a

rare one and few competent teachers are available.

I would recommend, therefore, that the Department of Health, Education, and Welfare establish scholarships and fellowships to stimulate the recruiting of young persons to fill these much-needed positions as mobility teachers for both blind children and newly blinded adults.

3. Vocational rehabilitation. For the middle range age groups, this is the most important service. It helps them get back to work and

acquire the independence sought after by most adults.

I have already recommended the removal of the means test as a qualification of a student for professional reader services. From the standpoint of an operating State agency, I would say that the scope of the program and the attitude of the Office of Vocational

Rehabilitation are unusually good.

We in the State, however, could be helped considerably in the ultimate job in vocational rehabilitation and that is placement of the blind person into competitive employment. If the staff of the Office of Vocational Rehabilitation were increased to provide experts with special skill in the placement of the blind, these experts could come into a State and work for a period of several weeks at a time.

In these field trips, it would be most helpful if these consultants would actually travel with the State vocational rehabilitation counsellor in job surveys of industrial plants. This service would be a stimulating help to our counsellors who are in the front rank trying

to open up employment opportunities for the blind.

4. Aid to the blind. The granting of aid to the blind is frequently a necessary step in relieving the economic stress upon an adult who becomes blind. Through this aid, the blind person is freed of worry over his basic maintenance and can participate freely in planning for his rehabilitation.

The Federal matching formula for aid to the blind should be increased so that the matching per case month is on a base of \$100 instead of the \$65 as it is under the present Social Security Act.

In September 1959, the average grant of assistance in Massachusetts was \$122.86, and the Federal Government matched only

\$41.50 of this cost.

It would seem axiomatic that the blinded individual should be provided with the means for a most basic level of maintenance in order to give him the strength and health to participate in a rehabilitation program. The research and training provisions of the Social Security Act should be implemented with appropriations in order to develop the professional skill of aid to the blind staff. For it is with these staff members that the rehabilitation process often begins.

5. Home teaching. This is a very important program within agencies for the blind. Frequently, the home teacher starts the blinded person off toward adjustment to his blindness through teaching some of the elementary skills needed in his functioning as a blind person.

It would help both in the quality and in the quantity of home teaching services if the Department of Health, Education, and Welfare would provide scholarships and fellowships for the training of home teachers and match/the salaries of home teachers with Federal funds as is done in the case of vocational rehabilitation counsellors and aid to the blind caseworkers.

I have tried during this brief period to indicate in a terse form some of the ways in which I, as a director of the Massachusetts programs

for the blind, see the needs of blind people.

Thank you very much for the opportunity of coming before your committee, Mr. Chairman.

Mr. Elliott. Thank you very much, Mr. Mungovan.

Are there any questions?

Our next witness is Dr. Albert T. Murphy, professor, School of

Education, Boston University.

At this time, before you start, Dr. Murphy, the committee will suspend for just a moment while the gentlemen of the press make a few pictures.

(Å short recess was taken.)

Mr. Elliott. You may proceed, Dr. Murphy.

STATEMENT OF ALBERT T. MURPHY, PROFESSOR, SCHOOL OF EDUCATION, BOSTON UNIVERSITY

Mr. Murphy. Mr. Elliott, committee members, my primary affiliation is with the Boston University Speech & Hearing Center. I am speaking also as representative of the Massachusetts Speech & Hearing Association, its president, and also as cochairman of one of the study groups, namely, that on speech, pathology, and audiology. Dr. Pronovost, who spoke earlier this morning, has mentioned a

Dr. Pronovost, who spoke earlier this morning, has mentioned a number of points that I consider particularly salient which I won't

repeat, but merely refer to at this point.

The two points that I would like to stress pertain to upgrading present personnel and the necessity for certain kinds of research in

the area of speech pathology and audiology.

I think there is no question on the basis of the facts that are being presented to you that there is a great need for a tremendous increase in numbers of workers. We need 5 to 10 times as many trained in

speech pathology and audiology as the New England institutions are producing at the present time.

In addition to the increase in numbers of trained workers necessitated by the increase in incidence, there is a crucial need to upgrade

the quality or the competencies of existing personnel.

Many workers in the field of speech and hearing disorders do not have desirable minimal competencies. Many others with basic competencies are in job settings requiring much more advanced training. They have the potential talent. It needs to be nurtured.

New England colleges and universities must develop programs on an advanced graduate level; most of them now are on undergraduate They must produce these programs if they are to train the

needed workers in speech pathology and audiology.

This will require the addition of high-level courses on the graduate These will require additional staff—at least 50-percent increase in the next 4 years, an increase in plant and equipment, if we are to train the numbers of persons that are going to be necessary to handle the increasing incidence that we are here discussing.

Universities must assume responsibility in developing and coordination of workshops and institutes designed to elevate the competencies of present personnel. There must not be merely institutes for speech pathologists and audiologists within their own discipline. There is a crying need for workshops of an interdisciplinary nature, incorporating efforts to educate and to coordinate and to be aided by allied professional areas.

A great variety of causes of speech disorders is a symptom of our relationship to almost all the other areas of speech education and

rehabilitation.

Community disorders may be caused by intellectual deviations, emotional or social distress, physical handicaps, all the areas that are

being represented at these hearings.

From this and other viewpoints our relationships must be very close with workers who are specialists in the allied areas, the role of medical specialists, nurses, other special educators, guidance workers, regular class teachers, parents, and members of industry in the finding, evaluating, and treating, or educating of persons who are speech defective, hearing disorder, or deaf.

In the area of research, as the final point, the needs are, I think, outstandingly evident. New England desperately needs research in

the following areas:

Research in the numbers, the types of disorders, the age distribution of these various kinds of disorders, the geographical location of persons with speech and hearing disorders, especially in relation to the preschool and the aged groups.

We need estimates of the educational and vocational potential of

these various persons of various types of handicaps.

We need research involving comparisons of the efficiency of various diagnostic treatment and educational techniques.

We are walking up a blind alley in many of our approaches now. We don't know exactly why we do what we do.

There must be research concerning the desired content, experiences, and duration of training programs to attain stated competency levels.

For example, how much liberal arts training compared to professional training for workers in these fields? What are the possibilities of completing 4-year programs and 3- and 5-year programs in 4, et cetera?

A person, in order to do full-time work, including summers, often will need assistance in order to get into the working situation more rapidly.

We need research concerning studies of discrepancies between the

university product and the school and agency job demands.

For example, analysis of reactions of supervisors in speech, hearing, and other special education and rehabilitation personnel. We need research concerning the evaluation of personnel characteristics of speech pathologists and their eventual job competency to develop prognostic criteria in these respects.

What are the characteristics that we can identify early which will give us an idea as to whether or not this person will be competent,

efficient, in this field?

To obtain such basic facts trained workers are necessary. For example, not one audiologist capable of doing such research is being trained in New England at the present time.

We need 20 each year for the next 5 years to begin to meet the

Finally, capable research workers usually on the doctorate degree level require grants in aid if they are to be kept from earning their usual salaries by the pursuit of advanced training. At least 40 such grants in aid at the advanced graduate level are needed in the New England area almost immediately.

Thank you.

Mr. Elliott. Thank you very much, Dr. Murphy.

Our next witness is Miss Dorothy Herrman, head school social worker, public schools of Stamford, Conn.

Miss Herrman, I am going to ask the gentleman from Connecticut, Mr. Giaimo, to preside at this point.

STATEMENT OF DOROTHY HERRMAN, HEAD SCHOOL SOCIAL WORKER, PUBLIC SCHOOLS, STAMFORD, CONN.

Miss Herrman. I appreciate very much the opportunity to be here today, although I am not going to be speaking on any of the particular bills which are before this committee, the House of Representatives bill No. 3465 does indicate this committee's interest in the matter of rehabilitation services for the mentally ill who are able to live in their own home.

I would like to speak today about the need for Federal support for preventive services for schoolchildren in order that the child may not develop into an adult with such severe problems that hospitaliza-

tion is necessary.

Before discussing the areas in which the Federal Government can be of help in the field of special education, I would like to comment on the philosophy behind, and rationale for, public schools spending money to provide these services such as classes for children with special educational needs from the gifted to the retarded, or offering services such as speech therapy or casework services.

Since the public school of today must educate all children-not just the physically and emotionally well child with average intelligencethe school has of necessity had to offer services for those children who

are unable to utilize the regular school program.

In addition, special services, particularly psychological and school social work services, are important because of their preventative aspects.

Mental illness is our No. 1 public health problem, since 1 person out of 10 will sometimes need hospitalization for such difficulties.

Obviously, the cost of this problem cannot be met purely by in-

dividuals, municipalities, or the State.

I might just divert from what I have written here to say that certainly the comments that Dr. Murphy was making about the need for funds in research apply-I cannot quote statistics and figures-but the need for research around the causes of mental illness is a whole area that needs to be given a great deal of consideration.

Federal assistance to States, I feel, is needed in three areas in the

field of special education:

(1) Recruitment and training of the various specialists needed to provide services, because of the serious lack of enough trained people in all these fields:

(2) In the development of research projects, the cost of which can-

not be met by local communities; and

(3) In the establishment of direct services; again an area often

affected by lack of funds.

In order to illustrate the effectiveness of one type of special service, I would like to tell you something about school social work service in Stamford, Conn., a community of approximately 90,000 with 14,000 public-school children. This is a community representing a crosssection of people from varied economic, racial, and religious backgrounds.

Last year, 1958-59, school social workers provided direct casework service to 6.7 percent of the elementary children and their families in schools with this service. These are children whose emotional problems or poor social relationships made for such difficulties that they

could not adequately utilize their educational experiences.

These are children many of whom have average or above intelligence, but are achieving far below their capacity.

These are children who without casework service when they are small, may develop more serious problems later.

These are children who are concerned about their problems and want help to overcome them.

Of this 6.7 percent given casework service in school, 6 percent needed

and were referred to psychiatric treatment.

If we apply Stamford's figures regarding children needing one of the special educational services—school social work—to the country as a whole, the size of the problem is almost staggering. But, also, the potential for preventative mental health services is most apparent.

I hope that this committee can develop ways of assisting our communities and States to more adequately meet the needs of children.

Mr. Giaimo. Thank you.

The next witness that the subcommittee will hear will be Edmund B. Boatner, superintendent, American School for Deaf, West Hartford, Conn.

You may proceed, Mr. Boatner.

STATEMENT OF EDMUND B. BOATNER, SUPERINTENDENT, AMERI-CAN SCHOOL FOR DEAF, WEST HARTFORD, CONN.

Mr. Boatner. Mr. Chairman, gentlemen of the committee, I am glad to have the opportunity to speak before you today.

I am particularly interested in House Joint Resolution 494, title I, particularly, which I feel more qualified to speak on since I have been

in this field for 27 years.

I am in very hearty accord with the provisions of this resolution. You are familiar with the facts as outlined in the resolution which says that 150 teachers are being trained each year, approximately, in recent years, where some 500 are needed.

Actually, the facts are more unfavorable than that.

There were 130 teachers last year trained in all the training centers and there are always a number from foreign countries. Also, some go into other work; that is, not directly into teaching.

So we had considerably less than 130 and less than one-fourth of the number of teachers needed to replace just the ordinary retirement and

other factors that lead teachers to drop out of the active field.

The greatest single factor is undoubtedly financial because it means that a teacher who trains has to give up a year's earning power and in many cases they have to pay for the training. This is quite a big problem to most individuals. No doubt this is the reason why six of the training centers had no enrollees at all during the past year.

There is a further limitation on the training of teachers of the deaf. That is imposed by the requirement for extensive practice teaching, which means that a single training center which uses a school for the deaf can usually handle not more than 12 students in any one year because more would be disruptive of the regular schoolwork.

Therefore, it is obvious that other training centers are needed, and, if this financial support is available to help these centers be established, I believe they will be, and will be a source of additional trained teachers.

At the present time there is only one training center in New England. It is a very fine center. They have 12 students this year. I am sure there are some foreign students there as there usually are.

At the American School for the Deaf we have had a desire for many years to establish a training center but the financial problems and other factors have prevented us from doing so. We hope to establish such a center in connection with some college in the Hartford area.

This bill would probably aid greatly toward this end.

Now, you probably wonder how our schools are getting on when these teacher shortages are so acute. Most schools have to resort to inservice training and sometimes to superannuated teachers. This presents a most undesirable situation. While we in most schools have to do it to some extent, in some areas, such as in the South, I am sure they have to resort to it to a great extent.

It is extremely difficult to impart to inservice trainees the background, techniques, and highly specialized skills of a successful teach-

er of the deaf.

I don't say it cannot be done: I just say it is extremely difficult

and in many cases I know it may never be accomplished.

In this regard I am sure it is difficult for a layman or even an experienced teacher to understand all the problems incident to imparting language, reading skills, lip reading, speech—all of those skills and subjects that are needed to train a deaf child.

In fact, this makes this the most complex of all fields, with the exception of the deaf-blind, of which there are less than a hundred.

I think 78 were listed in the last census. The teaching skills necessary to approach this problem cannot be picked up readily in a few weeks. They require intensive training, extensive practice teaching, and then they have to have years of experience to make a really able teacher.

For example, a child of 6 years without preschool training who is deaf may have equal intellectual ability with one who has good hearing, may enter a school for the deaf at the age of 6, who without preschool training, would have no concept of words as compared to this more fortunate child who has all of his hearing, who would have all the spoken language he would need to get along in his everyday needs.

There are many other illustrations, but I cite these to show the complexity of this field and why the need for training is so imperative.

But I would like to say something about the deaf, themselves, which

I believe you might be interested in.

Our school was the first one to be established in the United States in 1870. Since that time the deaf of this country through education acquired in this and now in many other schools have coped with the problems of life successfully as good citizens. They are a group of people who have never received a great deal of philanthropy, and all too little sympathy because they are handicapped. Their handicap is a lifelong handicap.

Think, for a moment, what it excludes them from, the usual give and take of conversation, the use of the telephone, the joys of music,

many occupational pursuits.

These are only some of the deprivations which deafness brings. Through all of this the deaf have never asked for anything, but an education. They have gone out and made their own way with a fierce independence.

I bring to your attention this one instance which in my estimation deserves a memorial of some sort in the lobby of the National

Capitol.

À bill was introduced in Congress some years ago by Senator Langer of North Dakota, the aim of which was to give an additional \$600 tax exemption to deaf persons. This was officially opposed by the National Association for the Deaf. It pointed out that while all of them needed the money the deaf felt they should not be excused from any of the obligations of citizenship.

Where can you find a better example of citizenship.

So it seems to me that we owe to deaf people the proper opportunities for satisfactory education which is all they ask, but which under the present circumstances they cannot get.

So far as I know the Federal Government has done nothing to help the education of deaf children of the elementary and secondary level since in 1819 they granted some 23,000 acres of land to help establish the school in Hartford.

I hope in this emergency we have come to the time when once again the Federal Government will extend aid to education of deaf children at that age which will insure them at least well trained teachers.

Thank you.

Mr. GIAIMO. Thank you very much, Mr. Boatner.

Are there any questions of Mr. Boatner by members of the subcommittee.

At this time we will hear the next witness, Adam J. Sortini, director, Hearing and Speech Clinic, Children's Medical Center, Boston, Mass.

You may proceed.

STATEMENT OF ADAM J. SORTINI, DIRECTOR, HEARING AND SPEECH CLINIC, CHILDREN'S MEDICAL CENTER, BOSTON, MASS.

Mr. Sortini. If I may be permitted, I prefer to stand.

I also would like to suggest that my manuscript here be submitted, since I will not read it as written, but refer to it occasionally.

Mr. Giaimo. Then you want to present that as a formal statement to be incorporated in the record?

Mr. Sortini. Yes, please.
Mr. Giaimo. Without objection, that will be done.

(The formal statement submitted by Mr. Sortini follows:)

FINAL REPORT OF THE MASSACHUSETTS COMMITTEE TO MIDCENTURY WHITE HOUSE Conference on Children and Youth

Beyond the provision for education of the school age child, however, there are further inadequacies in the Massachusetts program for the preschool handicapped child with sensory defects. There is, for example, no statewide program to prepare the child who is severely handicapped to participate successfully in formal education. A speech clinic for preschool children has just been established at the Children's Medical Center.

The parents of deaf and blind children are currently groping for help with their problems. Parents need advice about their own attitudes, feelings, and responsibilities for the child and his handicap, as well as with the specific training difficulties presented by the child. Little has been offered even under private auspices, either by a group or an individual approach, to aid parents in this

respect.

Emotional problems may be present in children who are blind or deaf as well as in children who are not handicapped. Very little recognition, however, has been given to the needs of these children in the psychiatric field. This service is badly needed to prevent children who may be emotionally disturbed, rather than intellectually retarded from being considered feebleminded and institutionalized. While Massachusetts has a few day classes for deaf children, there has been no similar development for blind children. With the current emphasis on nonsegregation of the handicapped child and the value of the child remaining with his own family group, this lack in our community program deserves consideration.

None of these children with sensory handicaps receive help under the crippled children's program in Massachusetts, yet many of them are severely disabled and need every medical facility available for all possible correction for their disabilities if they are to have a minimum of personality damage from their handicaps. No provision is now made except under private auspices for the correction or alleviation of any of these conditions in the preschool child. The Massachusetts Eye and Ear Infirmary has done etxremely valuable pioneering with the problem of deafness under the auspices of the Winthrop Foundation and Clinic, both in service to this younger group and in important research into causes and

treatment. Valuable assistance is given to the preschool blind child, which includes service to the parents of these children. Governor Dever has recently proposed that a special hospital school be established for blind, mentally retarded bables.

REPORT OF THE SPECIAL COMMISSION TO STUDY AND INVESTIGATE CERTAIN PUBLIC HEALTH MATTERS UNDER CHAPTER 78 OF THE RESOLVES OF 1948, DECEMBER 1, 1948 (THE COMMONWEALTH OF MASSAGHUSETTS)

CHILDREN WITH IMPAIRED HEARING

Massachusetts is one of the leading States in the detection of hearing impairment. Recently developed has been the Massachusetts hearing tests, which is described as being the first practical method of screening masses of children by way of group pure-tone method. The State department of health undertakes the service in smaller communities by means of State-owned apparatus. It is our opinion that Massachusetts is rapidly developing a satisfactory system which will operate from the rural level to the large city level with equal success. The problem, however, is that of arranging proper therapy if the impairment in hearing is detected. Furthermore, in the preschool age group, if our information is correct, no State program exists for the detection, treatment, or early education of the deaf child. It would seem desirable to have a plan on a State level which would provide consultative and diagnostic aid, and which would provide for the treatment that is indicated for the medically indigent. It would seem proper to provide hearing aids for such patients when necessary and to provide through a home study plan for the education of the parent of preschool deaf children.

Lipreading is an extremely important element in dealing with children whose speech is impaired or whose hearing for speech will in all likelihood be impaired. It is our impression that there is a tremendous variation in the quantity and quality of instruction of lipreading from town to town, but that reading instruction does not give rise to the same difficulties as the sightsaving classes, since lipreading is commonly administered as a supplement to the child's regular educational program, and the children are not uprooted from their normal classroom environment.

In connection with the comment under lipreading, it should be considered that the same teacher who develops competence in speech training might, likewise, be the one who develops the techniques of teaching lipreading.

Specific recommendations for the hard of hearing

1. Regional hearing conservation clinics, similar in distribution to the orthopedic clinics of the Services for Crippled Children, should be planned to give diagnostic aid, advice, and treatment for children with impaired hearing. These clinics should be under the Services for Crippled Children. Children patients should ordinarily be referred by way of the family physician; but in the instance of the known medically indigent, reference might be made directly from the school to the clinic. Children of preschool age as well as schoolchildren should be admitted to such a clinic. It is suggested that this program be developed in one area in an exploratory manner. The program should then be expanded as indicated.

2. Hospitalization should be provided for the medically indigent as necessary. This should be provided in existing teaching units, and funds should be made

available to support the cost of hospitalization.

3. Where necessary, as determined by financial incapacity of the patient, the Commonwealth should provide for the purchase in part or in full for the hearing aid for that child.

4. The Commonwealth should provide, through the department of education, a home study course which would enable the parents to begin the education of the deaf child at an early age. (Example: The home study course of the John Tracy Clinic at Los Angeles, Calif.)

5. See lipreading above.

SPEECH DEFECTS

The services for crippled children in the Commonwealth have had only one speech therapist to cover the whole State. It has been one of her duties, among others, to attend the crippled children's clinic, giving instructions at that time. At present, this position is unfilled and there is no speech therapist participating

in the program. The committee has not had time to investigate the speech training in our schools; the impression is obtained that it is not covered adequately. *Recommendations*

1. The amount of speech training and its efficiency in our schools should be investigated.

 Additional speech therapists should be added to the crippled children's services.

3. Speech therapy should be added to our public school programs as far as possible.

It is suggested that a teacher in each of our public schools should have a certain competence in speech instruction so that pupils with speech defects may have corrective exercises.

4. The department of education should develop and support the necessary facilities for the instruction of teachers in speech therapy. The possibility for

summer courses for this instruction should be considered.

5. The speech therapists at the State level, under the crippled children's service, should be available for consultation with the teachers regarding the individual children who have such defects. It is suggested that it is ideal that a therapist of these services should see each child and make specific recommendations to the speech instructor in the school. This would mean that individuals of lesser competence could carry on the school program.

6. A committee should be appointed to study this whole problem in detail and

make more detailed and specific recommendations.

Study of Facilities for the Hearing Handicapped, Metropolitan Boston, 1956--57

(Rehabilitation Council, Health, Hospitals, and Medical Care Division, United Community Services of Metropolitan Boston)

Dr. Janet Hardy, director of the Division of Maternal and Child Health, Baltimore City Health Department and a member of the staff of the Johns Hopkins Medical School and School of Hygiene, was engaged to get as complete a picture as possible, in a limited time, of—

1. Services and facilities, medical, social, and educational, including rehabilitation for the deaf and hard of hearing in Metropolitan Boston.

2. Any overlapping or reduplication of services.

3. Unmet needs in the areas mentioned above.

Dr. Hardy interviewed personnel in agencies and groups interested in or responsible for providing services to meet the needs of the hearing handicapped. These interviews were essentially unstructured but were designed to elicit information as to the types, quantity, and quality of services given, unmet needs, and how services of one agency fitted in with those offered by others.

The emphasis of this survey has been placed intentionally on services for children, although the problem of the adult hearing handicapped is also covered. Case finding, diagnosis, treatment, and education of the child constitute the best

preventive to adult problems.

The Sarah Fuller Foundation for Little Deaf Children has given service in Metropolitan Boston since 1888. In recent years this service has been restricted to home teaching of the very young deaf child. On September 1, 1957, the resources of the foundation were transferred to the Speech and Hearing Clinic of the Children's Medical Center. The foundation will continue to offer home teaching under the auspices of the Childrens' Medical Center, and will also see patients there.

The number of nursery school sessions that a hearing handicapped child attends per week depends on the needs of the child, the time that the parent can give to transport the child to the school, and the availability of trained teacher.

The shortage of trained teachers and transportation problems probably have more influence on the amount of teaching a child gets than do the child's needs.

The mentally retarded deaf child does present a problem of placement. The Horace Mann School for the Deaf has a class for the mentally retarded deaf child. However, this class is not adequate for the number of children who have both handicaps. There is a difference of opinion among experts regarding the proper type of placement for a child with both handicaps. The choice lies between a school for the deaf or for the mentally retarded, since no combination school is available. There are practically no scientific data on which to base the decision, as to which school a child should attend.

The superintendents of each of the four State schools for the mentally retarded in Massachusetts have expressed interest in creating a special unit for the mentally retarded who also have a serious hearing handicap. There are only four such programs in the country: Sonoma State Hospital, California; Faribault State School and Hospital, Faribault, Minn.; Wheat Ridge State Home and Training School, Colorado; and the Pacific State Hospital, California.

"The need for trained teachers of the deaf is probably the most critical problem * * * in the field of services for the deaf * * * throughout the world

today."

The lack of teachers in Massachusetts is due partly to a salary differential in favor of adjacent States and partly to the fact that too few teachers are entering this field.

Dr. Hardy felt that certification of teachers of the deaf in Massachusetts and a salary differential between teachers of the deaf and teachers of normal children would contribute to attracting more to the field.

An aggressive recruitment program, scholarships for the Clarke School program, and/or a training facility in an urban area should attract more teachers

to this profession.

Although this study is specifically concerned with the hearing handicapped, it is our opinion that schools, colleges, and medical centers in the area should give thought to developing more training programs for teachers of children with all types of handicaps. With relation to our specific interest, recruitment and an urban training facility seem to be the answer.

Therefore, it is recommended that:

III. Interested citizens, schools for the deaf, and voluntary and official agencies concerned with the problems of the hearing handicapped promote an educational program to interest students and teachers in the profession of teaching the deaf. This program should be concentrated, at least in the beginning, on the audience that is calculated to have the highest potential for this profession; namely, teachers who have had successful experience in teaching normal children.

IV. Recognized educational institutions, medical centers, and schools for the deaf in Metropolitan Boston be made cognizant of the need for a local facility for training teachers of the deaf and steps be taken to interest them in developing a facility that meets the standards for accreditation of training centers for the deaf of the Conference of Executives of the American Schools for the Deaf.

A short course, offered by a school or schools for the deaf, for workers in community agencies on the special aspects of the deaf would be helpful. This

would naturally cost money.

Therefore, we recommend that:

V. The State department of education, the schools for the deaf, the Boston Guild for the Hard of Hearing, and the Massachusetts Parents' Association confer to find ways and means to sponsor and organize a training program for workers in community agencies on the special needs of the deaf. This program

should be repeated as often as necessary,

VI. The appropriate agency—possibly the Massachusetts Department of Public Health or the Massachusetts Department of Education or both cooperatively—setup a research project which will provide basic, descriptive, meaningful data on the character of hearing impairments and their prognosis as a basis for (1) community planning, (2) developing standards for recommending specialized services for the hearing handicapped, and (3) training the various professions working with the hearing handicapped.

Therefore, it is our feeling that in a metropolitan area all these services should be under one roof, and that should be the roof of a medical center or centers; even though many of the services involved in this process are not medical, they are educational. Only a medical center can offer the basic highly specialized medical services. However, educational services in a medical setting should be supervised by an educator. The audiologic services should be handled by an audiologist and the otologic services by an otologist. In short, each specialist should be responsible for the technical operation and content of his own program.

The functions of such a hearing center have been delineated by the bureau of handicapped children in the New York City Department of Health:

(1) It should provide complete services for the diagnosis, treatment, and rehabilitation of children and adults who have or are suspected of having a hearing impairment. (2) It should care for not only patients usually known to the hospital but also patients referred to it by practicing physicians, community agencies, school health services, and industry.

(3) It should provide interpretation and guidance to the patient and his family and should assist them in making the necessary plans for the patient's total maximum rehabilitation.

(4) It should be a training center for professional personnel of all types, both at the undergraduate and postgraduate levels.

(5) It should perform research.

RECOMMENDATIONS

I. The rehabilitation council of united community services appoint a standing committee representing all of the specialties giving service to the hearing handicapped and those who receive these services (1) to organize periodic institutes or workshops, which will bring together all workers in the field of service to the hearing handicapped, to get acquainted, to exchange ideas, to work on common problems, to learn about new programs, discuss current thinking in the field, etc.; (2) to develop a master plan of services for the hearing handicapped in Metropolitan Boston and to use as a basis for this plan this report and the thinking of all who are working with the hearing handicapped as expressed at the first institute or workshop.

II. United community services through the health division give staff assistance to this standing committee to help it get started, and maintain contact with it until the coordinated approach of the various specialties serving the hearing handicapped has matured sufficiently so that the "hearing profession" can

assume total responsibility for its own program.

III. Interested citizens, schools for the deaf, and voluntary and official agencies concerned with the problems of the hearing handicapped promote an educational program to interest students and teachers in the profession of teaching the deaf. This program should be concentrated, at least in the beginning, on the audience that is calculated to have the highest potential for this profession; namely, teachers who have had successful experience in teaching normal children.

IV. Recognized educational institutions (for example, Harvard University, Simmons College, Boston University, Emerson College, and Boston College), medical centers, and schools for the deaf in Metropolitan Boston be made cognizant of the need for a local facility for training teachers of the deaf and steps be taken to interest them in developing a facility that meets the standards for accreditation of training centers for the deaf of the conference of executives of the American Schools for the Deaf (American Annals of the Deaf, vol. 101, January 1956, Gallaudet College, Washington, D.C.).

V. The State department of education, the schools for the deaf, the Boston Guild for the Hard of Hearing, and the Massachusetts Parents' Association confer to find ways and means to sponsor and organize a training program for workers in community agencies on the special needs of the deaf. This program

should be repeated as often as necessary.

VI. The appropriate agency—possibly the Massachusetts Department of Public Health or the Massachusetts Department of Education or both cooperatively—set up a research project which will provide basic, descriptive, meaningful data on the character of hearing impairments and their prognosis as a basis for (1) community planning, (2) developing standards for recommending specialized services for the hearing handicapped, and (3) training the various professions working with the hearing handicapped.

VII. An objective group of trained, competent specialists review the 1947 Harvard research, determine whether other research has been done in this area, and review the experiences of agencies in Boston and other communities in the use of hearing aid evaluation in an attempt to resolve the question of

the value of this service to the hearing handicapped.

VIII. The Boston Guild for the Hard of Hearing not increase its present capacity for hearing aid evaluation, and commence negotiations with one of the Boston medical centers concerned with the hearing handicapped to arrange either to transfer this activity to that center, or to develop a cooperative arrangement that will insure adequate supervision and followup.

IX. The Boston University Speech and Hearing Center negotiate with one of the Boston medical centers concerned with the hearing handicapped either

to transfer this activity to the center or to develop a cooperative arrangement that will insure adequate supervision and followup.

X. Private agencies that have been using their resources to purchase hearing

aids for children consider diverting these funds for other purposes.

XI. The medical centers in metropolitan Boston interested in the problems of the deaf and hard of hearing confer with the educators, the audiologists, and all other people involved, to discuss the idea of a hearing center and work out a plan that will give the Boston area this resource.

XII. Representatives from the State departments of education and public health, a medical center (interested in housing a hearing center), the Boston Guild for the Hard of Hearing, the Massachusetts Parents' Association for the Deaf and Hard of Hearing, and other interested organizations work out a plan for the regionalization of therapeutic services for the hearing handicapped.

XIII. A committee of competent persons in the field of service to the deaf and in the recreation field, including representatives from the Boston Children's Service Association, the Boston Guild for the Hard of Hearing, the Massachusetts Parents' Association, the schools for the deaf, and the recreation, informal education, and group work division of united community services work together to develop a facility that will offer comprehensive recreational and social activities for persons with a hearing disability who has not developed normal speech.

XIV. The availability of hearing screening tests to the parochial school population and the importance of this service to the child be brought to the attention of the proper authorities in the parochial schools in the archdiocese of Boston.

A SURVEY OF THE FACILITIES AND NEEDS FOR THE DEAF AND HARD OF HEARING IN THE GREATER BOSTON AREA

This project was undertaken upon the request of the United Community Services of Greater Boston. Miss Helen Cleary, staff member of the United Community Services was of inestimable help in organizing the survey and without her help it would not have been possible.

This project was undertaken by me upon the recommendation of Dr. William Hardy, director of the Johns Hopkins Hearing and Speech Center. Dr. Hardy has been most helpful in being available to me for discussion and consultation

with reference to the project.

This project would not have been possible without the interest and cooperation of all the various agencies and groups contacted in the course of the survey.

This was forthcoming in great measure.

Janet B. Hardy, M.D., director, Section of Preventive Medicine, Baltimore City Health Department; assistant professor of pediatrics, Johns Hopkins University; lecturer, public health administration, Johns Hopkins School of Hygiene and Public Health.

The following information contains, in essence, the findings and recommendations of Dr. Hardy concerning the hearing clinic at the Children's Medical Center.

"Facilities here are very limited from the point of space and from the point of proper soundproofing. However, they are treated to produce sound deadening and all the essential equipment seems to be there, including provision for psychogalvanic methods of testing."

"The volume of work going through the hearing clinic would appear to neces-

sitate additional staff and additional space.

"As the medically oriented diagnostic facilities for children in this area are limited and as the importance of this type of work receives increasing recognition the already increasing patient load will grow further. It would seem that longrange plans should be made for developing a really first-rate speech and hearing center at the Boston Children's with close liaison with the educational group for preschool children.

"This center should be planned with a view to:

"(a) Providing patient service.

"(b) As a research center.
"(c) For training personnel.

"With respect to the latter point there is a great need for medically oriented audiologists in this country, perhaps some liaison could be worked out with one of the graduate schools in the Boston area.

"(d) For house staff and medical student observation and teaching."

NOVEMBER 30, 1959.

Dr. WILLIAM SCHMIDT, Harvard School of Public Health, Boston, Mass.

Dear Bill: Further to our recent conversation with George Starbuck, I am forwarding to you copies of my reports as chairman of the Committee on Accident Prevention of the Massachusetts Chapter of the American Academy of Pediatrics. This may not represent entirely a complete picture of what is going on in the State, but probably Miss DiCicco of the State department of health can fill things in.

I should also like to urge that your committee consider seriously making some strong recommendations regarding the present shortcomings of Massachusetts with respect to maintaining a system which is adequate for producing teachers qualified to manage the problems of the handicapped. My understanding is that our teachers' colleges provide little or no opportunities for training of this sort. This has been a longstanding deficiency of the department of education. In addition, I know of no extra inducements, salarywise, for teachers to enter this field. I would not expect the number of such teachers ever to be very great in view of the special interests and aptitudes involved, but they are sorely needed at the present time, and we must have more of them if our efforts to train and educate young folk with special problems are to be effective. My budget committee in UCS which has to deal with rehabilitation facilities has been encouraging the Boston Guild for the hard of hearing to develop community interests in meeting the problems of the deaf and hard of hearing. However, any local interest generated will wither when there are demonstrably few or no teachers to be found. This longstanding problem was mentioned in my 1930 White House conference report and in the reports of the last two State health commissions.

Yours,

LENDON SNEDEKER, M.D., Assistant Director.

Mr. Sortini. I think you gentlemen have been listening to facts and figures. As I have been sitting here over the past half hour I have been watching Mr. Daniels. For example, I don't know whether or not he can speak because I have not heard him speak.

This gentleman here has been doing some stenotyping.

As I speak, I am communicating in one way through his using that machine and as Mr. Daniels looks at me he can communicate with me by saying something to me.

The point I am trying to make is that I think perhaps the most intimate form of communication in our society is being able to speak. If we cannot speak, if you gentlemen were not able to speak, you would not be where you are.

If I were not able to speak perhaps I would not be here.

So with all the handicaps, although we must admit and we well realize in the field of speech and hearing that some handicaps are equally as important as the others.

At least from my way of thinking I think perhaps the most crippling type of handicap is an inability to express one's ideas. If we have a form of handicap where we are unable to express our ideas, then we are not living—we are existing.

Now, there have been any number of research studies of a general nature. For example, the Commonwealth of Massachusetts report of the special commission to study and investigate certain public health matters on December 1948 at that time suggested that regional hearing conservation clinics should be planned to give diagnostic aid, advice and treatment to children with impaired hearing.

It suggested the children with speech defects in the whole State of Massachusetts were being serviced at the State level by one person through crippled children's services and it suggested further research.

In 1951, in the mid-century White House Conference on Children and Youth, it stated that there were inadequacies in the Massachusetts program for the preschool handicapped child with sensory defects.

It mentioned that parents of these children were groping for help with their problems, parents needed advice about their own attitudes,

feelings, and responsibilities.

Very little recognition has been given to the needs of these children

in the psychiatric field.

The Massachusetts Eye and Ear Infirmary, it was mentioned at that time, has done extremely valuable pioneering work with the problem of deafness and it was mentioned that in 1951 a hearing clinic had been established at the Children's Medical Center in Boston.

I started with the Children's Medical Center as director of the hearing clinic on July 1, 1951. I typed my own letters for 6 months.

Eight years later I have a staff of 14 people. If we were able to find the people, if we were able to provide some training grants, if we had funds, we could add seven more people immediately to my staff—immediately.

I have submitted as part of my testimony a picture of my testing area. This testing area includes an operator's room which is 7 by 7 feet, for 49 square feet and a testing room of 7 by 13 feet, which is

91, or a total of 140 square feet.

In this total work area of 140 square feet I see 2,000 children a year. My staff of 12 professional people and 2 secretaries last year, in 1958,

saw 7,500 children with speech and hearing problems.

Speech and hearing problems are here to stay. As further testimony, in 1956 Dr. Janet Hardy from Baltimore was asked to come to Boston to make a survey of the facilities and needs for the deaf and hard of hearing in Greater Boston. The following information is from Dr. Hardy's recommendations concerning the hearing clinic at the Children's Medical Center:

Facilities here are very limited from the point of space and from the point of proper soundproofing. The volume of work going through the hearing clinic

would appear to necessitate additional staff and additional space.

It would seem that long-range plans should be made for developing a really first-rate speech and hearing center at the Boston Children's Hospital with a view toward providing patient services, as a research center, and as a center for training personnel.

Our hospital—and speaking for our hospital alone—has two major functions. We are a diagnostic center; we are a training center.

In 1956 to 1957 the United Community Services presented a report and several major recommendations were made, again pointing out the fact that there was great need for educational institutions among these Boston University, Emerson College, Harvard University, Simmons College, to set up training programs.

The final piece of testimony is dated November 30, 1959. You see, gentlemen, we have gone from 1948 through 1959. We have been talk-

ing and talking. Now we must do something.

This is dated November 30, 1959. It is a statement by Dr. London Snedeker, assistant administrator, Children's Crippled Center, to Dr. Schmidt of the Harvard School of Public Health. This is in part a report of the Massachusetts chapter of the American Academy of Pediatrics:

I should like to urge that your committee consider seriously making strong recommendations regarding the present shortcomings of Massachusetts with respect to maintaining a system which is adequate for producing teachers qualified to manage the problems of the handicapped. My understanding is that our teachers colleges provide little or no opportunity for training of this sort.

This has been a longstanding deficiency. In addition, I know of no extra inducements salarywise for teachers to enter this field. I would not expect the number of such teachers ever to be very great in view of the special interest and aptitudes involved, but they are sorely needed at the present time and we must have more of them if our efforts to train and educate young folk with special problems are to be effective.

I have been at the Children's Medical Center for 8½ years. I have been continually upset over the fact, with all due respect to my New England friends in terms of neighboring States, that in the Boston area which at least until several years ago was usually considered as the medical center of the world, we have a number of various sources where we could provide inteacher training, but there is only one center, as has already been presented, which provides teacher training for the deaf in the New England area, which is the Clarke School for the Deaf, of course, in Northampton.

But here again, and if I'may simply mention the fact, the Perkins School for the Blind is usually considered one of the finest schools

for the blind in the world.

We have the Walter E. Fernald School for the Mentally Retarded.

This is all in the periphery of Boston.

We have the Judge Baker Guidance Center for emotionally disturbed children.

We have the Horace Mann Day School for the Deaf.

We have fine centers in terms of Boston University and Emerson College. We have the facilities if we can only obtain the funds to initiate and to expand what is already there.

For this reason, gentlemen, I am here to support 494, and in terms of the fact that we have been talking about it for over 10 years, let us

do something now.

Thank you.

Mr. Giaimo. Thank you very much.

The next witness will be Edward J. Waterhouse, director, Perkins School for the Blind, Watertown, Mass.

STATEMENT OF EDWARD J. WATERHOUSE, DIRECTOR, PERKINS SCHOOL FOR THE BLIND, WATERTOWN, MASS.

Mr. Waterhouse. May I briefly introduce myself. My name is Edward J. Waterhouse, and I was born in England and educated at the University of Cambridge. I have been a resident of the United States since 1930 and a U.S. citizen since 1935.

I have been on the staff of the Perkins School for the Blind almost

continuously since 1933, and its director since 1951.

I am a member of the legislative committees of the American Association of Workers for the Blind and the American Association of Instructors of the Blind.

I am a member of the Governor's Advisory Committee of the Massachusetts Division of the Blind, the president of the Massachusetts Association for Promoting the Interests of the Adult Blind, and a

member of the executive committees of various other organizations engaged in the education and rehabilitation of blind people.

I am also the secretary of the International Conference of Educators of Blind Youth, and have attended international conferences in

Europe, Asia, and South America.

Since my appointment as director, I have been able to travel extensively, visiting over 70 schools for blind children in the United States and in 18 other countries.

Perkins was the first school for blind children to receive a charter in the United States. This took place in 1829 under the laws of Mas-

sachusetts

Presently, the total enrollment is approximately 300 pupils. Special features of the school include the Howe Press, which embosses books and manufactures equipment; the Perkins Library, which is the regional library for New England of the Library of Congress; two teacher training programs, one for workers with the blind, and the other for workers with deaf-blind, both in association with Boston University; an extensive department of psychology and guidance, and the largest department of educating deaf-blind children anywhere in the world. This latter contains 29 children this year.

The following brief breakdown of our income is significant. These

figures are approximate and are for the school year 1958-59:

From State sources:	
Tuition Library services	
Total	643, 045
From private sources:	
Tuition Interest on endowment	
TotalFrom Federal sources:	610, 485
American Printing House	8, 500

I would like to draw your attention to the fact that Federal funds provided less than 1 percent of our income. The exact figure is 0.67 percent. Yet without the supply of books and other equipment provided from these Federal funds, our program could hardly have functioned at all.

It should be noted, however, that the equipment received on quota from Louisville was not, in itself, adequate, and the school paid approximately \$2,000 to its own Howe Press for additional material

of this kind.

In the course of my extensive travels, I have found no Federal program in any country as effective in serving the needs of blind children as the program financed by Federal funds to provide books through the American Printing House.

As will be seen, the actual cost is not great. If we had to buy these services, it would not be a great tragedy, but if these services were not available at all, we would be in a very difficult position.

Without the Federal assistance which has helped to create the necessary organization it is difficult to see how these services could ever have been made available.

I presume, Mr. Chairman, that this committee will have to give consideration to the spending of further Federal funds in the service of educating blind youth. I think that careful attention should be given to the very vast differences existing in the attitudes of our State governments as to what is desirable for their blind children.

Some States are offering services which would seem to be reasonably adequate. I am sure that any one of us could wish to do better, and none of us, I am sure, is entirely satisfied with what he offers.

We have pupils enrolled from about 25 of our 50 States. Most of the children who come from outside New England are deaf as well as blind. The education of each child in this group is extremely expensive, running to about \$9,000 a year.

Half of this cost comes out of our own resources, and the remain-

ing \$4,500 is charged in tuition.

Some of the wealthiest States find difficulty in meeting this fee,

while some of the poorer States meet it readily.

Mr. Chairman, if I have learned any one thing from my dealings with the various States, and from my travels both at home and abroad, it is that finding money is not the prime problem. Rather, it is that money is entirely secondary to the attitude of workers with the blind, where there is a willingness to provide a service, funds are almost always made available.

I do not believe that your 2-year study, valuable as it may be, can answer what is to me the most important question of all. This is: "Why do States offer services of such varying value to their blind

children?"

While I am in favor of many of the proposals which are coming to you as a result of these hearings, I would believe that the most important step you could take would be for you to request the Department of Health, Education, and Welfare to encourage each State overluate for itself the services which it is offering to the blind boys and girls in its care.

I am sure that if the citizens of different States realized how poorly they compare in many ways with some of their neighbors, they would insist on providing comparable services. I am sure that every State would find that in some respect or other it does not com-

pare with the best.

From the results of such self-evaluation each of us could see where he is lacking. I believe that the results of a well-structured study of this kind, adequately circulated, would provide results comparable in value, dollar for dollar, to those mentioned above in connection with the federally supported program of the American Printing House for the Blind.

I thank you for your kind attention.

Mr. Giaimo. Thank you very much, Mr. Waterhouse.

The next witness is Rachel Baker, president of the National Organization for Mentally Ill Children, Fairfield County Chapter, Conn.

STATEMENT OF RACHEL BAKER, PRESIDENT, NATIONAL ORGANIZATION FOR MENTALLY ILL CHILDREN, FAIRFIELD COUNTY CHAPTER, CONN.

Mrs. Baker. Gentlemen, you have heard a number of distinguished witnesses requesting an increase in financial aid to existing programs for helping handicapped people of various kinds.

My request is going to be rather unique. I do not ask for any increase or acceleration of service at all. I am going to speak about a

426 SPECIAL EDUCATION AND REHABILITATION

group of people who have no service whatsoever and you have a complete virgin territory in which you can begin and give assistance on a planned and coordinated scale.

I am speaking for the mentally ill children. I am the president of the Fairfield County Chapter of the National Organization for

Mentally Ill Children.

The national organization is a group of parents and relatives of severely ill, mentally ill, children. Many of these children are ill from infancy. There are almost no facilities whatsover either statewide or in the local community for their planned and coordinated care.

So I am going to request a few possible explorations of Federal assistance in order to begin a program for these children whom I look

upon as the most neglected, the most forgotten in America.

Briefly, I will ask for the following:

That the National Government should, first of all, find out for us how many there are. There is no way at all to estimate. So I would request that the National Government provide some means to collect and provide statistics on the number of severely mentally ill children in the Nation.

I will now read a passage from the report of the White House Con-

ference by our organization which says that:

Although the Biometrics Branch of the U.S. Public Service secures some information on State hospital services to children, and receives information from some voluntary inpatient and outpatient facilities, it is mandatory to institute a nationwide reporting system for all voluntary and public facilities serving the prepsychotic and psychotic child.

Now, if this were made possible it would offer only a very small reflection of the state of need since so many of the cases are hidden, so many of these children are in institutions not planned for their care.

For example, I believe in our State institution, excellent State institution for the mentally retarded in Connecticut, which is one of the outstanding in the Nation, there are 80 so-called autistics, that is non-verbal children mute through emotional reasons, who are there in an institution that is planned for the care and treatment of the mentally retarded.

So there are probably many hidden cases which then would have to

be ascertained by some other means.

Now, a few States have recently passed laws providing that the public schools should offer special services and classes to emotionally disturbed children and eventually in those States where those laws will be implemented perhaps it will be possible to find out the number of children of school age who are mentally ill.

In that way we may perhaps estimate the number in the Nation.

But I feel that the first thing for which I would like to speak is that the National Government should set up some means to collect and provide statistics on the number of mentally ill children in the Nation and then that the national office should provide a program of planned and coordinated research.

Some research grants are now given by the National Mental Health

Institute, but these are spotty.

That the National Government provide a program for planned and coordinated research aid to:

(a) Define this illness. The greatest possible confusion exists in

regard to the definition of the illness.

(b) Determine its physiologic and other causes.

I understand there is great need for physiologic, biochemical, neurological research.

(c) Develop plans for prognosis and treatment. So we need Government aid for a planned and coordinated program of research.

Then, three, that the national office should provide for or aid in the gathering of information on pilot projects on an international scale.

The only work that has so far been done for these children has, in America, been done where the distraught parents got together, raised money, and provided some kind of pilot project.

We now have a number of such pilot projects on the eastern seacoast and some on the western seacoast, and these already offer an

example of possibilities of care and treatment.

I understand that in other countries, Austria, I believe, and Switzerland, more has been done. So I think we need to study pilot projects

in this virtually unentered field.

Number 5, I should like to suggest that the Government should disseminate information and give aid to inspire the States and the local communities to undertake coordinated care of these children. care might include local day care centers, counseling and home help to give relief to the parents; summer camps, special public services.

The local community takes almost no responsibility at all for the severely mentally ill child. So I think a great deal of inspiration, .

guidance, and information is needed there.

Then we need State facilities. We need a study of the possibilities of not the creation of large State institutions where, perhaps by the situation that an institution exists, we lock the problem away from us and there it remains, but we need the centralized facilities so that these children who are locked off from the world already will not be locked away from the opportunity or remaining as near to their parents and to the conditions of normal family life as possible.

The field is great. We have no experts to present and everything that I have said is said from the point of view of only what the par-

ents alone have experienced and found out up until now.

Thank you for letting me appear.

Mr. Giaimo. Thank you very much, Mrs. Baker.

The next witness will be John E. Swan, president of the Clarke School Parents Conference, Northampton, Mass.

STATEMENT OF JOHN E. SWAN, PRESIDENT, CLARKE SCHOOL PARENTS CONFERENCE, NORTHAMPTON, MASS.

Mr. Swan. Mr. Chairman, members of the committee, have you ever had the experience, while enjoying a TV show, of having the sound go dead. You know, then, how virtually impossible it is for most of us to watch faces and lip movements and be able to understand what is being said. We may frantically seek another channel, or just give up for a better time.

Multiply this loss of sound situation to encompass the entire world

of hearing, for this is what faces the deaf.

Lost to them, perhaps forever, is the beauty in the song of a bird, the ominous warning or the cheerful comfort in the crackling of a fire, the blended sounds of a great symphony, or the noise of an approaching automobile.

Also missing are even the little things such as the rustle of a newspaper as the pages are turned, the crunch of snow under one's foot, the purr of a kitten, or the ticking of a clock. Yet, thousands of children

live in this kind of world.

Many of these children have never really heard sound. They cannot switch to another channel or give up for a more favorable time and situation. Indeed, they come to the realization that they are different and, much as they may wonder why, must try to cope with a predicament not of their choosing.

In deaf children, very often their problems may well stem from the one exceptionally characteristic of now being able to hear. This does not mean they cannot be happy, that they are not alert, that they are not intelligent or that they cannot lead independent, useful, and pro-

ductive lives in a hearing society.

It does mean that there is a tremendous task for them to succeed,

by way of a most difficult road.

Let me cite a few examples in respect to their education. For the deaf, it is a near impossibility to follow a group discussion, for they

cannot know who will submit his view next.

Picture the difficulty, without the faculty of hearing, in trying to catch a question or comment thrown in when another has the floor. Or taken the normal educational practice of a lecture proceeding simultaneously with demonstration. Here visual concentration must be focused on one or the other, even if the educator does not turn his back or get behind his apparatus.

Or yet, the problem of taking notes. You and I can guide our writing by watching our paper and let our ears pick up the message. In the education of the deaf, teachers must recognize these and many

other problems and adapt their methods accordingly.

In many respects one's education, personality traits, and interests in life are acquired by following the example of others. Young children learn to use their spoons, tie their shoes, put away their belongings, and so on, by watching members of the family. They pick up little mannerisms such as a wink or a nod or enjoy the same pursuits as their parents or other children.

All our senses—smell, sight, touch, taste, and hearing—seem to be aroused by the example set by others. This, very often, is poignantly brought home to the parents of deaf children while these youngsters

are at a very tender age.

A child, born deaf or deafened in his first year, may imitate other children in many ways, particularly in play habits. Then, perhaps in the second year, as the parents anxiously await the first sound of speech, they suddenly sense that speech sounds are not being imitated as are these other habits and expressions. This awakening may be their first indication that the child does not have normal hearing. The ensuing diagnosis as to the type of impairment and the degree of loss usually is beyond the average general practitioner of medicine.

There have been unfortunate cases where parents realizing their children cannot hear normally have not been guided to available experts in the field. Unless detection and complete diagnosis is made early, several years of valuable time to adapt the deaf child to the

manner of his education may be lost.

Training in the home can make a start. Through correspondence courses and various societies or agencies working with those having hearing handicaps, the parents can lay a groundwork. With the deaf child, as with any child, the span of interest is initially very short. To maintain contact, there must be a mutual visual relationship.

You cannot call to the child to look at you, and if he wants to turn his head or close his eyes, there is little chance of getting his attention.

This means repetition and patience, over and over.

Persistence eventually pays and the attention discipline or routine gains in effectiveness. One can proceed with learning by association.

Speech of the parent has very little meaning. The child's understanding starts by associating a lip movement or facial expression with an object, one he sees very often. Gradually his vocabulary of lipreading gains headway. This goes on by adding new objects, playing games of recognition, and adopting similar tactics until you can broaden the child's understanding by having the objects represented in more than one way, like having a ball, a picture of a ball, the word "ball," or having balls of different sizes or colors.

Everything the child learns must be based first and foremost on

establishing an understanding.

We parents are often impressed, particularly as the deaf child moves through the years of formal education, with how simple and fundamental this threshold of understanding still must be and how much

repetition is required.

We tend to overlook that repetition plays a very similar role with the hearing child, but in that instance the contact is through the medium of speech and hearing. For with the hearing, this repetition is done far less consciously than to first establish visual contact as we must do with our deaf children.

As a child grows older, his thirst for knowledge increases even faster than his years. This must have means of expression. To most of us the means of expression is speech, which although not denied to a deaf child is certainly not readily acquired. Here is where the parent generally finds himself quite inadequate. Here is where we must turn to specially trained persons to forward the education of our deaf children.

There is vastly more to speech than just pitch or volume. I speak of breath control, position of the tongue and the lips, resonance in the throat or nose, and rhythm. Many of these elements of speech are not visual, the child simply cannot acquire the ability of speech by watching others. Speech imitation is largely restricted to the hearing. One small example is found with the words "red" and "green." To us,

these seem very distinctly different. But I ask you to try to say before a mirror the words "red" and "green" with no sound.

You will find the visual image very similar and if not carefully spoken could be misinterpreted by a deaf person who must rely on

lipreading.

There are numerous other examples. Many sounds have no visual expression. To educate the deaf to speak means they must consciously memorize perhaps several distinct parts of making even a simple sound, such as an E or an R.

Patience for repetition and a firm understanding of speech fundamentals become ever so much more important for the teachers of the deaf than for those teachers training hearing children. For those teaching the deaf, we parents have only admiration and respect. Theirs is frequently a life of devotion, filled with many heartaches and frustrations. It has also its joys, hard won, but rewarding, as when a small face lights up with the thrill of understanding.

I hope, through this view of a parent, you have gained a bit more

insight into the problems of teaching deaf children.

We feel that any Federal action to encourage more persons to become teachers of the deaf will benefit society and the welfare of

this country.

This year our parents group membership comes from 20 of the States, plus the District of Columbia and Canada. Within Massachusetts, some 69 different cities and towns have at least one set of parents represented.

To interpolate these educational needs to embrace the entire United States, considering our parents' group is affiliated with but a one school, only emphasizes the salient points brought out in House Joint

Resolution 494.

In behalf of the Clarke School Parents' Conference, and parents of deaf children anywhere, I have been pleased and proud to present my views and sincerely support any efforts to see this legislation be favorably acted upon in the next session of Congress.

Thank you.

Mr. Giaimo. Thank you very much. Mr. Swan. Mr. Chairman, I should like to offer the addendum I have of the details of cities and towns of Massachusetts with my statement.

Mr. Giaimo. Without objection, the information will be made a part

of the record.

(The addendum referred to follows:)

ADDENDUM

The Clarke School Parents' Conference is comprised of parents of deaf children from:

Canada Michigan South Carolina New Hampshire Colorado Texas New Jersey Connecticut Vermont New York Delaware Virginia District of Columbia North Carolina Washington Georgia Ohio Wisconsin

Maryland Pennsylvania Massachusetts Rhode Island

Detail of Massachusetts cities and towns:

Mr. Elliott. We have reached the point in our proceedings here this afternoon that we must recognize those who have been engaged in the workshops.

First, may I introduce Dr. Elena D. Gall, assistant to the director

for field studies.

We have been conducting in Washington and about the country for a period of several months now a special education and rehabilitation study under the direction and the overall supervision of this subcommittee.

Dr. Gall will tell us about the part of the study, the workshop, that has been conducted here in New Haven. She will present the repre-

sentatives of the workshop groups.

Dr. Gall.

STATEMENT OF ELENA D. GALL, ASSISTANT TO THE DIRECTOR FOR FIELD STUDIES, SUBCOMMITTEE ON SPECIAL EDUCATION, COMMITTEE ON EDUCATION AND LABOR

Dr. Gall, Mr. Chairman and members of the committee, the Special Education and Rehabilitation Study Committee has been for 2 days deliberating on the unmet needs in special education and rehabilitation which is the function of your subcommittee, and we have been able to do this with the help of approximately 235 representatives of all of the New England States who in turn represent over 100 private and public agencies who are interested in at least seven areas of exceptionality.

Most of our participants have come and paid their own way and

given freely of their time.

I heard the story last night of a dedicated school administrator who had used her Christmas Club money to pay for the expenses of the trip. But it is in this spirit that the people of New England have answered to the call of your subcommittee, Mr. Chairman, and have responded, as you have, to the needs of the handicapped individuals in the New England region who are not yet being treated or cared for at this time.

It gives me a great pleasure to say that the New England regional workshop has reached a new height in the quality of workshops on the

subject of the unmet needs of the handicapped.

Perhaps it was because of the surroundings. In the great university of Yale we felt that only top quality thinking and contributions would do at this time and we are indebted to Mr. Giaimo and Miss Hartman for having made such excellent preparations.

Mr. Chairman, if you will call the representative of each workshop according to the title of their workshop, the chairman or representa-

tive of that group will come up and introduce himself and present the deliberations of that group.

Thank you.

Mr. Elliott. Thank you, Dr. Gall.

First, we have the speech hearing group, William A. Philbrick, Jr.

STATEMENT OF WILLIAM A. PHILBRICK, JR., SUPERVISOR OF SPEECH HANDICAPPED, HARD OF HEARING, AND DEAF DEPART-MENT OF EDUCATION, COMMONWEALTH OF MASSACHUSETTS

Mr. Philbrick. Mr. Chairman, my name is William A. Philbrick. I am State supervisor of speech handicapped, hard of hearing, and deaf department of education, for the Commonwealth of Massachusetts.

I have heard that there are three types of persons who read manuscripts. The one type very carefully takes each page, puts it aside, lifts the next page, puts it aside, in good order, and you can measure his progress down to the bottom of the heap.

The second one picks up the first page and reads the front of it and then turns it over and reads the back of it and this is not as optimistic, but still progress can be measured down to the bottom of the heap.

And the third and most reprehensible kind is he who takes each sheet and carefully reads it, puts it aside, until he has reached the bottom of the heap and then picks it all up and turns to the back side

and starts to read the back side again.

Well, we shall not do this. Those of us in the field of the speech handicapped, hard of hearing, and deaf would not do it especially because we are intensely conscious of a factor in our field that is known as auditory fatigue. This is something that happens from constant drumming upon the eardrums of some kind of sound stimuli.

So to help prevent that we will not even take all of the 10 minutes so graciously allotted to us, but instead rest confident upon the report,

a copy of which we should like to enter into the record.

We feel that all of us have worked very hard for 2 days and that this report really is the culmination of all our professional wisdom and we confidently entrust it to you, to your professional wisdom and knowledge of the arts of government and the needs of the national picture, with only this brief summation to structure it for you, based on two items:

The one is the number of persons needing speech and hearing therapy and education as deaf persons in New England, based on a na-

tionally accepted incidence figure, and,

Two, the present state of the training programs, the training in-

stitutions, and the numbers of students wishing to be trained.

As far as New England is concerned, over one hundred thousand children, based on a national incidence figure, need speech and hearing therapy and thirty thousand are getting it.

The one hundred thousand figure would need twelve hundred and twenty-seven trained speech and hearing therapists to give the kind

of care required in the public schools alone.

We have actually 198 such speech and hearing therapists.

The problems in the field of the deaf are equally as serious. Teachers are needed and have been needed for over 10 years in that area.

We turn, then, to our source of supply, the training programs and training institutions, and find that the five excellent training institutions in speech and hearing therapy in New England will turn out in June 50 speech and hearing therapists to meet that need of 1,027

and many of those will not stay in New England.

Therefore, you can see we have listed needs for funds in the form of grants-in-aid, in the form of scholarships, in the form of fellowships, in the form of incentive rewards to States to set up particular programs for speech and hearing, to rural areas to waken persons in rural areas to the needs of their own children and their own adults, and to waken preschool parents and adults to their own needs and the fact that they can be supplied if action will be taken.

The figures that we have used are as basic as we can get. The amounts of money we have quoted we have quoted as we see the need, knowing full well when the time comes you will adjudicate these

amounts as you see fit in the interest of the national picture.

Speech and hearing presents its case in this report and hopes that

you will deal kindly with it.

Mr. Daniels. Mr. Philbrick, in this report have you set forth the five training centers?

Mr. Philbrick. The five training centers, yes, sir, and the number they turn out and the needs they would have this year for faculty and staff and equipment and in 1965 for faculty and equipment on the road to meeting the need now and in 1965.

Mr. Daniels. Thank you.

(The report referred to follows:)

WORKSHOP REPORT ON THE SPEECH AND HEARING HANDICAPPED

Workshop meetings on Speech and Hearing Education and Rehabilitation held at Yale University, New Haven, Conn., December 15 and 16, 1959.

Cochairmen:

Dr. Geraldine Garrison, Supervisor of Speech and Hearing, State Department of Education, Connecticut.

Dr. Albert T. Murphy, Professor of Speech Pathology and Audiology, Boston University, Boston University.

Corecorders:

William A. Philbrick, Jr., Supervisor of Speech Handicapped, Hard of Hearing, and Deaf Department of Education, Commonwealth of Massachusetts.

Dr. Wilbert L. Pronovost, Director, Speech and Hearing Center, Boston University, Boston, Massachusetts.

Workshop participants:

Joan Allen, speech pathologist, Portsmouth Rehabilitation Center, Portsmouth, N.H.

Hilda F. Amidon, supervisor of speech and hearing services, Board of Education Hartford, Conn.

David P. Barron, supervisor, speech and hearing clinic, Southbury Training

School, Southbury, Conn.

Edmund B. Boatner, superintendent, American School for the Deaf, West Hartford, Conn.

Norton Canfield, Yale University School of Medicine, Connecticut State Medi-

cal Society.

Alan G. Crouter, superintendent, Mystic Oral School for the Deaf, Mystic, Conn. Pauline Ehrlich, assistant in charge, lipreading classes, Boston public schools.

Dennis Ellsworth, board of education, public schools, Fairfield, Conn. Estelle E. Feldman, director of pupil services, department of education, New

Haven, Conn.

Herbert J. Gavilli, same as counselor.

Inez E. Hegarty, chairman, Department of Speech and Hearing, University of Massachusetts.

Martha E. Jones, speech and hearing clinician, New Britain public schools, New Britain, Conn.

Grace M. Kennedy, speech and hearing counselor, Newton public schools, division of counseling services, West Newton, Mass.

Helen MacPherson, hearing consultant, public schools, Providence, R.I.

Edmund G. McLaughlin, executive director, speech and hearing clinic, Bridgeport, Conn.

Julian Perlstein, counselor, State Bureau of Vocational Rehabilitation, Hartford, Conn.

Catherine C. Perry, chairman, Department of Speech Pathology and Audiology, Emerson College, Boston, Mass.

George T. Pratt, principal, the Clarke School for the Deaf, Northampton, Mass. Frances Roberts, Connecticut State Department of Mental Health, West

Hartford, Conn. Harred Saleh, director of speech and hearing, 68 Earl Avenue, Hamden, Conn. Josephine E. Setterberg, senior speech and hearing consultant, West Hartford

Board of Education, 7 Whiting Lane, West Hartford, Conn. Adam J. Sortini, director, hearing and speech clinic, Children's Medical Train-

ing, Boston, Mass.

Jane F. Stapleton, social worker, Boston Guild for the Hard of Hearing.

Theona S. Sutay, supervisor of speech and hearing, Bridgeport, Conn., supervisor's office, Hall School, Claremont Avenue, Bridgeport, Conn.

SPEECH AND HEARING

I. Incidence

A. Great need for intense research to identify the types and geographical distribution of speech and hearing problems and deafness. This need implies the necessity of wholehearted cooperation among agencies of all kinds to accomplish the desired result.

B. Factors involved in the production of diverse incidence figures are:

Lack of standardized criteria to delimit types of problems.
 Listing minor degrees of problems as major.
 Geographical location of speech or learning handicapped persons.
 Degrees of training of persons in diagnostic or educational centers.
 The American Speech and Hearing Association estimates of incidence are:

C. The limetreal operating liperential estimates of incidence	c arc.
	Percent
Speech handicapped	3

D. There is a need for Federal support of a law requiring registration of persons with speech and hearing problems.

E. Pertinent data:

A. Connecticut data.—The White House Conference estimated that 5 percent of the school population have speech and hearing handicaps. This report on status and needs in Connecticut is based on this 5 percent prediction: 22,885 children in Connecticut public schools have speech and hearing problems; 35 percent or 8,000 (approximate) children are now receiving speech and hearing in Connecticut public schools; 65 percent or 14,875 could benefit were such services available; 80 speech teachers now provide services for the 8,000 children; 150 additional speech teachers are needed now to provide services for the 14,875 children on the ratio of 100 children to each teacher. In most Connecticut schools the speech teachers work with from 60 to 90 children, not 100 children; 10 additional speech teachers are needed now to meet speech needs of the mentally retarded children.

Thus 160 additional speech teachers are needed now in Connecticut public schools. This does not include the 3,965 children who could benefit from speech and hearing services were such services available in parochial schools. An additional 40 would be needed to work with children in parochial schools. Fourteen positions are now unfilled as a result of resignations. Four speech teachers coming into Connecticut schools in September 1959, were trained in Connecticut.

1965-66: 5,767 additional children will need speech and hearing services in 1965, 58 additional speech teachers will be needed to work with these 5,767 children in 1965; 20 additional speech teachers will be needed to work with mentally

retarded children in 1965.

Thus 318 speech teachers will be needed in Connecticut public schools in 1965; 70 additional speech teachers will be needed in parochial schools in 1965; total, 388 speech teachers will be needed in public and parochial schools in 1965, 308 more than in 1959. Where are they coming from?

SCHOOL FOR THE DEAF, 1959-60

Sixty-four percent increase in enrollment at one school for the deaf (Mystic) during the past 6 years. Present enrollment 139: 27 children are on the waiting list because of lack of teachers; 9 classroom teachers are needed now and cannot be found; 4 special teachers are needed now: supervising teacher, librarian, 2 physical education teachers; 2 house mothers are needed to maintain a ratio of 1 house mother to 10 children; 1 audiologist is needed for hearing evaluation of pupils upon admission and for systematic retesting and for advice in fitting of hearing aids; 1 psychologist is needed for adequate psychological testing.

2. Massachusetts data (IE).-50,000 children in Massachusetts public schools have speech and hearing problems; 34 percent or 17,200 (approximately) children are now receiving speech and hearing therapy in Massachusetts public schools; 66 percent or 32,800 could benefit if such services were available; 100 therapists now provide the services for the 17,200 children; 320 additional speech teachers are needed now for the 17,200 children (100 children to each teacher); 90 speech teachers are needed to meet the needs of mentally retarded children (educable); thus, 410 additional speech teachers are needed now in Massachusetts public schools. This does not include the more than 5,000 parochial school children who need these services.

1965-66: 12,500 additional children will need speech and hearing services; 125 additional speech teachers will be needed for them; 25 additional speech teachers will be needed for the mentally retarded;

Thus 660 speech teachers will be needed in the Massachusetts public schools

in 1965.

DEAF

Six hundred seventeen Massachusetts children are presently attending residential schools, day schools, or day classes for the deaf. These children attend the Beverly, Boston, and Clarke Schools for the Deaf—residential schools; the Horace Mann School—day school; six day classes in public schools; and the Rhode Island School for the Deaf in Providence, R.I., Austine School in Brattleboro, Vt., and American School for the Deaf in Hartford, Conn. Perhaps 5 percent of the deaf children are emotionally disturbed or mentally retarded to such a degree as to render placement in a regular school or class for deaf impossible. There is no source of education for them at this time.

Federal assistance is needed to provide trained personnel in institutions for disturbed and retarded children so as to assist these children in the development

of language and communication.

OTHER NEW ENGLAND STATES

	Need therapy now	Teachers needed now	Increase in cases by 1965	Number extra teachers needed by 1965
Maine	9, 500	95	2, 380	24
	3, 700	37	925	9
	5, 650	57	1, 450	15

Norz.—Much of the work in these States and in Massachusetts, Rhode Island, and Connecticut towns of less than 5,000 population will have to be done on a regional basis. This does not take into account all the clinical, hospital, college, university, and private practice speech and hearing therapists needed in the States.

- II. Extent and kinds of present services and facilities for diagnosis, education, and guidance and need of better services and facilities.
- A. Massachusetts, Maine, New Hampshire, and Vermont need State reimbursement programs for speech and hearing in the public schools.
 - B. Private schools need Federal aid for speech and hearing programs.
- C. Approximately 50 percent of mentally retarded children need speech and hearing therapy.
- D. Different States have different needs. This implies need for a coordinating body or individual in each State as well as the whole region.
- E. Perhaps a regional diagnostic, education, and treatment center is the answer for the child with a complicated language disturbance. The cleft palate team at Tufts needs to be duplicated or to travel—perhaps pilot programs are needed for selected groups (preschool, geniatrics).
- F. Although the public schools own teams can do diagnosis and therapy with many multiple-handicapped children—and ought to be encouraged to do
- more—the severely multiple-handicapped child is often not served.
- G. We need intensification of preschool diagnostic and treatment facilities; means of doing counseling at home; the use of written materials for parents and children; extension of social work services to these families. Pilot nursery school programs should be set up. Increased guidance services should be made available to the adolescent and adult speech hearing handicapped and deaf populations. Federal funds to assist in the creation of units like the Sarah Fuller Foundation, sending trained teachers of the deaf into the homes of hearing handicapped infants to help the parents understand the problem and when appropriate to begin the teaching of language and communication to the child.
 - H. Provision must be made for family followup work by school social workers
- and guidance.
- I. Funds to facilitate better screening of speech and hearing handicapped infants by providing grants for training of pertinent personnel.

- J. Funds to provide two annual 6-week workshops to upgrade personnel presently functioning in speech and hearing and education of the deaf—these workshops to invite 25 to 30 persons from the region and to cost approximately \$30,000 each.
- K. Meeting the needs of private and parochial school populations as well as the children with severe speech and hearing problems by operating summer school speech and hearing programs and by assisting the creation of summer day and residential camps for speech handicapped, hard of hearing, or deaf children.
- L. Speech and hearing personnel and coverage in Office of Vocational Rehabilitation and State outlets should be amplified.

M. Education, information, and reciprocal assistance must be effected with guidance personnel, psychologists, medical personnel, nurses, and other allied

individuals by means of institutes, workshops, and conferences.

N. Federal assistance is necessary to increase existing physical plants because of pressure of increasing caseloads, required personnel, and new equipment. However, lack of data on types and degrees of problems, cerebral palsy, aphasia, etc., prevents pertinent proposals for sizes, teachers, and equipment needed. (Massachusetts Eye and Ear—300–400 outpatient cases annually; Children's Medical Center, 2,000 cases annually.

O. To meet the problem of facilties in rural areas for speech handicapped, hard of hearing, and deaf persons, the following procedures are necessary:

1. Federal funds to be made available to departments of education to launch intensive information campaigns to create an awareness of the existing problems and the assistance required.

Utilization of summer camps for speech and hearing handicapped or deaf persons to demonstrate size of problem and techniques for coping with it.

3. Federal assistance in creating regional public school speech and hearing

programs as well as regional diagnostic, educational, and treatment centers.

4. Federal funds for transportation, board, and diagnostic and therapeutic fees for children and adults visiting regional diagnostic medical centers for speech and hearing examinations.

5. Pooling of speech and hearing resources with those of other rehabilitation

and education facilities to create centers offering wide services.

6. Federal funds to explore feasibility of and provide materials for—

6. Federal runds to explore leasibility of and provide materials for— (a) Utilization of homemakers extension services in State departments of agriculture, Grange organizations, farm bureau, 4-H clubs, and other farm community clubs to publicize the existence of speech handicaps, hearing loss, and deafness, and to educate rural populations in the types of diagnostic and therapeutic services indicated.

(b) Requesting assistance of the visiting nurses associations for similar informational purposes—providing mobile testing units and recording units at county fairs to spread awareness of the existence of facilities and the need for same.

P. Extension and amplification of services to the homebound by providing fees for speech and language retraining of adult aphasics at home or in nursing homes.

Q. Need for more extensive services and assistance to speech handicapped, hard-of-hearing, and deaf persons through State rehabilitation offices, with prostheses for cleft palate problems and hearing aids for hearing handicapped supplied at

minimal cost, 25 percent, by the Government.

R. If funds could be made available to employ an instructor, methods and techniques for preparing persons to do pure tone threshold hearing testing together with information on hearing conservation could be provided through a concentrated 2–3 week workshop held in different sections of the State. Of necessity enrollment in such a workshop should be kept small. An estimated 300 school nurses and other persons would attend these workshops. The workshops could be conducted in a local school, a school for the deaf, a State college or the university at a nominal cost. The benefit to children with suspected hearing losses would be of great significance in both time and money.

S. There are many children with minor speech and voice difficulties which could be corrected in the speaking activities in the classroom if classroom teachers had basic preparation in speech improvement. This preparation in speech improvement could be provided classroom teachers through (1) college courses at the college or at the local level or (2) workshops held at the local level or on a regional basis. The equivalent of three college courses would give the needed preparation in speech improvement. The Federal Government could

help by making available the financial assistance necessary to provide the college courses or workshops. The cost would not be great, but could include the cost of tuition or the fees of the instructor at the workshop.

III. Personnel and training facilities

A. There is great need to increase the training facilities for teachers in the field of the speech handicapped, hard of hearing, and deaf. This necessitates amplification of staff and facilities in training centers as well as scholarships,

fellowships, and upgrading of present personnel.

We now have 193 speech and hearing teachers in the public schools of New England. On the nationally accepted incidence of 5 percent of the school population having speech and hearing problems, and the nationally accepted ideal of 1 speech and hearing teacher per 100 children, we actually need 1,027 such teachers to serve all the speech and hearing handicapped children needing help. We desperately need at least 260 of the 1,027 teachers immediately.

Office of Vocational Rehabilitation has estimated that for the preschool and adult populations (school population excepted) one speech pathologist and audiologist per 50,000 persons is required. On this basis, New England needs 200 such clinicians at this moment in its hospitals, clinics, and private agencies, but has no more than 50. At least 50 more of the ideal 200 are needed im-

mediately.

B. In the field of the deaf in New England in 1958-59 classroom teachers were

needed. Only 118 were trained for the whole country with 516 openings.

In 1959-60 new teachers were needed. Only 127 were trained for 511 positions. One hundred and sixty-one are now training nationally but five centers have no students at all. Scholarships are badly needed now; higher salaries are needed soon.

C. At this moment four New England teachers are training for the deaf at Clarke. Ten graduate students in speech and hearing will soon graduate from South Connecticut College. Eighteen students will graduate in June from Boston University. Thirty students will graduate in June from Emerson College. Seven students will graduate in June from the University of Connecticut.

These small numbers (4 teachers of the deaf, 65 speech and hearing teachers) indicate an overwhelming need for a concerted recruitment program. American Speech and Hearing Association should be given a Federal grant to do a national recruitment program in all our fields. With this should be an information program, public relations program, and an organized drive for upgrading present personnel.

D. Extension courses and clinical demonstrations must be used to create

accessibility of training.

The increase in numbers of therapists and teachers of the deaf would require more supervision, therefore more supervising help, therefore more staff and much greater expense. Among the schools for the deaf even supervisory and administrative staff are in very short supply because of the duration of the teacher shortage. Federal assistance is badly needed here.

The numbers of hospital, clinic, and private agency positions receiving speech and hearing clinicians of the educational rank referred to as speech pathologists or audiologists indicate the need of expanded training programs qualified to train people to this high level. The course requirements, necessary staff, equipment, and supervision would necessitate double or triple the personnel and budgets

now obtaining in training institutions.

F. No audiologists are being trained at this moment anywhere in New Eng-The gravity of this situation cannot be overemphasized.

G. The present crippling caseloads being borne by speech and hearing therapists in most parts of New England probably preclude the possibility of really successful therapy with most of their cases. This overwhelming amount of work may also cause young therapists to leave the profession.

H. There is a great need of Federal aid in the form of reimbursement for part of the salary of new personnel in speech and hearing and education of the deaf at the State level, in public or private schools, hospitals or clinics, or in the form of reimbursement for expansion of existing programs of speech and hearing or

education of the deaf.

I. There is needed a minimum of \$500,000 annually for 5 years in the form of grants-in-aid and fellowships to expand existing training programs and to facilitate the creation of new training programs in the fields of speech and hearing and education of the deaf.

J. The present lengthy practicum requirements of 1 residential year for teachers of the deaf, and the growing tendency to increase the length of practicum programs in speech and hearing-thus implying the need of 5-year and 6-year training programs—indicate clearly the need for Federal funds to facilitate the assumption of such practicum programs by students in speech and

hearing and the education of the deaf.

K. The Federal Government should rescrutinize the provisions of the Social Security Act of 1936 relating to assistance to persons in depressed, rural areas. In many cases today the population explosion has carried the better class city folk out into the rural areas, thus raising this socioeconomic level, and has left the city a much depressed area. New lines and provisions must be drawn to take cognizance of this shift.

Funds should be available for persons in local or State supervisory positions in schools, hospitals, clinics, or agencies to pursue such extra training as will

bring them the advanced certification befitting their responsibilities.

IV. Research needs

A. Intensification of incidence studies by type, age, and geographical distribution.

B. Comparison of educational and treatment approaches—especially for the retarded and physically handicapped.

C. Many studies on adolescent speech and hearing problems—a barren area. D. Analysis of transition between school and work—correlation between guid-

ance personnel and rehabilitation agencies.

E. Incidence by type and age of persons attending clinics and agencies not accounted for in other data.

F. Value of temporary sheltered employment and training for persons with

severe speech or hearing handicaps.

G. Better prognostic methods with adults having severe speech and hearing problems.

H. Kinds of facilities best adapted to rural versus urban population (central

versus dispersed, etc.).

I. Need of laboratories to study the psychophysics of audition and the speaking process.

V. Pressing financial problems working against more effective service

A. Source of tax moneys may have reached peak-city property can yield little more. New traffic patterns of funds must be found.

B. Salaries of regular school teachers cannot be met my schools for deaf

initially or for maxima. This cripples recruitment. Same for institutions for mentally retarded. C. Shortage of young male teachers indicates that salaries are not sufficient

to support a family.

Mr. Elliott. Thank you very much, Mr. Philbrick, for your testimony.

Next, the group that worked on mental retardation.

STATEMENT OF HELEN F. FREEMAN, COCHAIRMAN, WORKSHOP COMMITTEE, MENTAL RETARDATION

Miss Freeman. Mr. Chairman, I am Helen Freeman-

Mr. Elliott. Now, Miss Freeman, let me say this to you: You speak as loudly as you can because some of our folks tell me that they are having difficulty understanding what is said. We think this is one of the very fine parts of our hearing here and we want everybody to have an opportunity to hear you. So you speak as loudly as you can, please.

Miss Freeman. Thank you, sir.

I am in good voice; I am sure I can make myself heard. As my colleague Mr. Philbrick has suggested, we will be brief. We are not telling you how and so forth; we are simply suggesting what needs to be done. We are very grateful to your committee because so far as we know, at least within our own lifetime, this is the first chance that all of the people in New England have gotten together to discuss

these unmet needs in this situation.

We have all kinds of groups, professional and lay, private and public, political and just citizens, to discuss the problems. Some of the things we are going to present to you perhaps are particularly indigenous to New England; but, since we are an area that represents perhaps sections of all the rest of the country, we think that our findings are significant.

The other point is that in the past and with our long programs of education and other fields, which have been continuing, there have been times when we have not been in agreement, but within this 2-day session we have come to a unanimous agreement on the points that I

am going to make to you.

To explore just a bit further why I say we are a good representa-

tive group, we do have these five things:

First of all, we have concentrated masses of population.

Secondly, we have a wide divergence in service development.

Three, we have varied degrees of State and local participation and development.

Four, we have multiracial and social groups.

Five, we have varied economies.

This is most important, both agriculturally and industrially.

In other words, we represent urban populations and rural populations.

The last one, perhaps, is ours. The traditional New England reluctance to seek aid outside her own boundaries and the rugged individualism so characteristic of New England since the days of the Founding Fathers—in other words, much of what we have done to date we have done on our own.

These are the areas in which we suggest that you can help:

First, then, we would suggest to you that we have a national census

of the population of people who are retarded.

We would suggest that, late though it may be, if you could incorporate a couple of leading questions in your 1960 national census that might be of help. Otherwise, in some feasible way.

To date we have no national census as to the approximate numbers of these people. After all, our determinations of needs relate themselves to numbers so far as staff and budgetary requests are concerned.

No. 2, diagnostic services. We would like to suggest that you expand your program of grants-in-aid to make available to hospitals that are approved by American Hospital Association, to these hospitals that have pediatric services, funds for the provision of counseling and diagnostic services to the mentally retarded and their families and that to disburse these funds, you set them up in an equitable distribution.

We are all in agreement that the early diagnosis, the early recognition of these children will make the program for all of the mentally

retarded a much better one.

The third point we make has to do with education of personnel and training facilities. I am referring here to this wonderful Public Law 85–926. The fellowships awarded there are fine and we want them to continue, but we would make two further recommendations:

No. 1, that you expand to include more than the 14 colleges or universities already mentioned.

May I insert here we don't have one in New England. We would

like that.

The second point is that you include in some way your grants to the

teachers in special education.

Actually, in New England, we agree that the dearth of specially trained teachers is jeopardizing continued progress in the fulfillment of the need of the retarded.

Our fourth point has to do with homebound and sheltered services

and I will read this quickly:

Be it resolved, That the Federal Government institute a program to facilitate the development of adequate services to the mentally retarded in the following categories:

One, those who are preparing for sheltered workshop and/or vocational

rehabilitation service.

Two, those currently homebound, but potentially able to participate as active members in the community to some degree.

Three, those currently in institutions who through such services as indicated

may be returned to their homes.

We feel that this area of help for the older retarded is one of our areas of most crucial need.

The fifth point, more direct services to children and client.

I am here referring to Mr. Philbrick's suggestions on speech and hearing. These new provisions are fine. Those of us in the field of mental retardation only hope that some of the people who are going to do this work will be cognizant of the need of the retarded as we are concerned with speech and hearing problems.

No. 6. I generally call family services. Here we are suggesting that the maternal and child health grants of the Federal Government not be limited to public health departments, but, rather, that they be given over or assigned to any agency, public or private, which the

State suggests.

Here we are thinking in terms of the development of day care services, not just for the young, but for the older retarded who can fit into any other area; for those retarded who require specialized care not now generally available, specialized dental services and training

programs for dentists who can provide these.

The amendment of the Hill Burton Act to enable the construction of special medically and therapeutically oriented facilities for the defective delinquent, recreational programs as a supplement for those who have no other place in society, as a supplement to day care activities, education, rehabilitation, residential care, and as a common activity for those who can participate in no other organized program.

For additional research and increased budget for wider distribution

of health information aimed at reducing birth defects.

We feel if the information we already have were disseminated perhaps 25 to 40 percent of the defects that are occurring at birth could be eliminated.

For improving prenatal care, pediatric care and child health supervision. That additional funds be made available for increased field services of the Federal agencies concerned with the implementation of programs for the retarded.

Very simply, we need grants for schools in New England very

badly.

That, in essence, is what we have come up with.

Conditions and the situations are not particularly isolated in any one area in New England, but I am presenting to you four or five problems which are common to all of us here.

Once again, thank you very much for hearing me.

Mr. Elliott. Thank you, Miss Freeman.

Did I understand that your workshop group was unanimous on this report?

Miss Freeman. Yes, and that is unusual for us. Mr. Elliott. That is unusual, it certainly is. (The report referred to by Miss Freeman follows:)

REPORT OF WORKSHOP ON MENTAL RETARDATION FOR THE NEW ENGLAND AREA, YALE UNIVERSITY, DECEMBER 15, 16, 1959

The representatives of the New England States here assembled to discuss unmet needs in the field of mental retardation wish to express our gratitude to the congressional Committee on Education and Labor and especially to the subcommittee on Special Education for the opportunity afforded us through this workshop. This experience, we feel, has been unique both from our point of view and yours. For us, it is the first opportunity ever presented where representatives of local and State agencies, lay and professional organizations, public and private agencies have met to articulate and synthesize the needs in mental retardation of the entire New England region, with relation to assistance which might be offered by the Federal Government. For the committee, we believe, you have introduced to this field a new technique of investigation, where the overworked term "grassroots" has taken on a real meaning.

We believe that this approach will be most fruitful to the Congress, to the Federal Government and to the people you serve. While we have special interests and consideration for the needs in the field of mental retardation, as New Englanders we are most anxious to determine that any program which is undertaken will be a sound investment for the Nation, based on actual, articulated needs, not intuition, and evolved in workable fashion so that it will bear fruit in the habilitation or rehabilitation of the largest possible numbers of the

handicapped individuals we seek to serve.

Certain problems in the field seem to be indigenous to New England, but the fundamental basic needs in mental retardation are probably reflected nationally by the conditions we found-

1. Concentrated masses of population. Wide divergence in service development.

3. Varied degrees of State and local participation and development.

4. Multiracial and social groups.

5. Varied economies, both agricultural and industrial.

6. The traditional New England reluctance to seek aid outside her own boundaries, and the rugged individualism so characteristic of New England from the days of the Founding Fathers.

In its delibertion the committee has addressed itself not to the writing of new legislation as such, but has oriented itself to the needs of the mentally retarded and their families in both urban and rural areas; nor has the committee directed itself to isolated conditions but has concentrated on universal needs.

Only a few years ago, professional people of all disciplines working with the retarded were of varied opinions as to the needs, care, treatment, management, control, rehabilitation, guidance and followup of the retarded. There was even disagreement as to the techniques required to achieve these goals for the

retarded.

A striking characteristic of the deliberations of this committee, composed as it was of representatives of virtually every discipline concerned with the problems of mental retardation, was the unanimity of opinion which emerged concerning the following recommendations:

CENSUS OF RETARDED POPULATION

Be it resolved, That the Federal Government undertake a national census. for the determination of our retarded population at its earliest convenience, if possible, within the framework of the 1960 general census, or by whatever feasible means, since the projection of future needs depends on explicit knowledge of the numbers to be served. Determination of needs relate themselves to staff and budgetary requirements.

DIAGNOSTIC SERVICES

Be it resolved, That the Federal Government, through an expanded program of grants-in-aid, make available to hospitals, which meet A.H.A. standards and have pediatric service, funds for the provision of counselling and diagnostic services to the mentally retarded and their families; that these funds be disbursed through a formula based on equitable distribution. Early diagnosis and continued evaluation are essential to the formulation of a life plan which will give every child an opportunity for optimum development (provided that we offer a total service program).

EDUCATION PERSONNEL AND TRAINING FACILITIES

Be it resolved, That the Federal Government continue the benefits derived under Public Law 85-926, but that the law be amended to enable the fellowships provisions provided therein to be applied to any teacher training institutions which are accredited to grant graduate degrees in special education, in addition to those institutions already listed under the law.

Be it resolved, That the Federal Government institute a program for undergraduate scholarships to students at any accredited teacher training institution and are studying in or specializing in the area of mental retardation .

The dearth of specially trained teachers is now jeopardizing the continued progress and the fulfillment of the needs of the retarded.

HOMEBOUND AND SHELTERED SERVICES

Be it resolved. That the Federal Government institute a program to facilitate the development of adequate services to the mentally retarded in the following categories:

(1) Those who are preparing for sheltered workshop and/or vocational rehabilitation services.

(2) Those currently homebound but potentially able to participate as active members in the community to some degree. (3) Those currently in institutions who, through such services, as indicated

may be returned to their homes. Our committee unanimously agreed that this is one of the areas of most crucial need.

MORE DIRECT SERVICES TO CHILDREN AND CLIENTS

Be it resolved, That the Federal Government take appropriate measures for inclusion of the needs of the mentally retarded in the development of training programs of specialists in the speech and hearing areas. The increased recognition of the shortage of personnel relative to problems in the speech and hearing fields will hopefully result in measures at the national level to remedy an emergency situation. We earnestly request that full consideration be given to the mentally retarded in these areas.

FAMILY SERVICES

Be it resolved, That the maternal and child health grants of the Federal Government should not be limited to public health departments. In the development of programs for the mentally retarded by the various States, responsibilities have been assigned to agencies other than the public health department. It is therefore logical that the aforementioned grants should be made available more flexibly to the agencies designated by the States. The resolutions presented above reflect our thinking concerning those problems of an emergency nature which require Federal assistance. There were many other spheres of activity where vital needs were expressed and where lack of Federal support had deterred progress. We earnestly request that the Federal Government begin to study the ways in which it can act as a catalyst to the development of day care services; for those retarded who require specialized care, not now generally available; specialized dental services for the retarded and training programs for dentists to provide these services; the amendment of the Hill-Burton Act to enable the construction of special medically and therapeutically oriented facilities for the defective delinquent, recreation programs as a supplement to day care activities, education, rehabilitation, residential care and as a common activity for those who can participate in no other organized program; for additional research activities; increased budget for wider distribution of health information aimed at reducing birth defects, improving prenatal care, pedatric care and child health supervision, and that additional funds be made available for increased field services of the Federal agencies concerned with the implementation of programs for the retarded. We need grants for schools in New England.

We feel that our findings are descriptive of the conditions which prevail in New England; that the recommendations herein stated will help assure that every mentally retarded child will have the opportunity to progress to his fullest

potential.

We believe we have made known the problem and the needs. We pledge that if this Congress will implement these recommendations on the Federal level, the workers in the field of mental retardation in New England and throughout the country will transform millions of handicapped, dependent, rejected individuals into self-respecting, self-supporting dignified citizens of our Nation.

WORKSHOP PERSONNEL

Area: Mental retardation; cochairman: Miss Helen F. Freeman, Mrs. Rhoda Shaw Clark.

Eleanor Smith, regional office of vocational rehabilitation.

Manon B. Smith, director of education for mentally retarded children.

Bernice Chaletzky, special class teacher, Swampscott, Mass.

Mrs. Robin Hedges, executive secretary, Maine Committee on Problems of the Mentally Retarded.

Margaret Q. Doyle, public schools, Milton, Mass.

Alice M. Irwin, supervisor, special education, North Bedford, Mass.

Leonard Lyons, bureau of vocation rehabilitation.

Mildred Kronow, sheltered workshop, Bridgeport, Conn.

C. M. Green, State superintendent of schools, Union No. 21, Hampton, N.H. Mrs. Ida E. Day, Everett public schools, special class teacher-educable.

Mrs. Helena Murphy, special class teacher, Bedford public schools.

Mary A. Decoster, recreational instructor for the mentally retarded, city of Boston.

John J. O'Donnell, principal of school.

Margaret L. Droney, supervisor, special education, Lowell public schools.

Mrs. Thomas Burke, teacher of trainable mentally retarded.

Joseph C. Lonergan, supervisor, division of special education, Massachusetts Department of Education.

Rhoda S. Clark, New Hampshire Committee on Special Education.

Mildred L. Brazier, representative, Walter E. Fernald State School, Waverly, Mass.

Burton Blatt, Southern Connecticut State College, 501 Crescent Street, New Haven, Conn.

George Brakner, Southern Connecticut State College.

Joseph Marra, Connecticut Bureau of Vocational Rehabilitation.

Clifford Beebe, bureau of vocational rehabilitation, Connecticut.

Helen F. Freeman, director, Caroll-Hall School of Lesley College, Massachusetts Commission on Mental Retardation.

Ann Switzer, Connecticut Association for Retarded Children.

Joseph Gerillo, State Bureau of Vocational Rehabilitation, Connecticut. Charles P. Fonda, Mansfield State Training School and Hospital.

Ann Connors, social adjustment commission, caseworker, Connecticut.

Kathryn M. Haverstick, director, social adjustment commission, Connecticut. Mrs. Frances R. Cook, counselor, social adjustment commission, Connecticut. Joseph Freedman, Massachusetts Commission on Mental Retardation, Boston Association for Retarded Children.

Maurice Mezoff, executive director, Massachusetts Association for Retarded

Joseph Lavender, consultant, education for mentally handicapped children,

Connecticut State Department of Education, Stanley Meyers, executive director, Parents and Friends of Mentally Retarded

Lawrence L. Rossi, supervisor, division of recreation, city of Boston.

Dr. Philip G. Cashman, director, division of special education, State department of education.

Pearl Vavrek, Connecticut Bureau of Vocational Rehabilitation.

Ira W. Gabrielson, community program for retarded children, Connecticut State Department of Public Health.

Dr. Frederick J. Gillis, assistant superintendent in charge of exceptional children, Boston public schools.

Paul V. Sherlock, State supervisor of education for handicapped children, Rhode Island.

Clifford C. Beebe, Connecticut Bureau of Vocational Rehabilitation.

Mr. Elliott. Now, the group that studied the neuromuscular and orthopedic problems will please report.

STATEMENT OF GERTRIDE NORCROSS FOR WORKSHOP STUDY COM-MISSION ON NEUROMUSCULAR AND ORTHOPEDIC HANDICAPS

Miss Norcross, I am Gertrude Norcross, from the Connecticut Society for Crippled Children and Adults.

Mr. Elliott. Miss Norcross, are you going to speak good and loud? Miss Norcross. Yes, I think so. I have never been known not to be heard. I have a lot of faults, but that is not one of them.

Our particular section, Mr. Elliott, had a very exciting 2 days. fact, we were still going strong at 4 o'clock yesterday afternoon.

As a result of this we are asking that we be given the opportunity. to make use of that 5 days grace that you have allowed the various workshop groups and file a complete report with you which is being prepared over the weekend.

Mr. Elliott. Without objection, we will be happy to receive the report from the group on neuromuscular and orthopedic problems and when the report is received it will be made a part of the record at

this point.

(The report referred to follows:)

Workshop Report on Neuromuscular and Orthopedic Handicaps

This is an interim report of the committee. A full description of deliberations will be given to the legislative committee within 5 days.

We propose here to simply indicate the major areas that were considered by the committee and present this outline as a guide for the legislative committee.

GENERAL CONSIDERATIONS

I. Composition of the committee

Seven persons from State rehabilitation agencies were represented. State departments of education, physicians, administrators, private rehabilitation, and special education agencies made up the remainder of the committee.

II. General considerations

1. Recognition of handicappeed persons as an important segment of our economic and social life. We are requesting in these recommendations that the same services as are presently provided for the nonhandicapped be considered as basis to whole concept of this committee and indeed to the moral health of the Nation.

2. The fields of special education and rehabilitation are in close approximation in the area of neuromuscular and orthopedic problems, but not necessarily in need of general consolidation at this time. Each realizes the same services from time to time but this cannot mean that administrative or service controls should merge.

3. A basic feeling of this committee regarding employment, education and social activity for the handicapped is that, wherein possible integration in these

areas with nonhandicapped persons should take place.

4. In areas of rehabilitation and special education, including again the educational, employment, and social areas of life, a close look at present age limitations and reductions should take place. We feel that this applies to all the areas that we will later present and so make a general statement at this time.

5. The committee is presenting basic recommendations concerning expansion. strengthening or redirection of existing programs and facilities in addition to

thoughts about new services.

We have divided our work into the three traditional subgroups of treatment

(and service) education and research.

However, in view of the short time we have had to prepare this material we feel it would be unfair to present conclusions to you without further refinement. We will therefore provide the committee with copies of our deliberations in 5 days.

I will be happy at this time to answer any specific questions concerning the

work of our group.

ATTENDANCE SHEET

Louise Wilkin, Gaylord Farm, Wallingford.

Ruth M. Olson, New Britain Memorial Hospital.

Robert P. Hogg, Goodwill Industries.

Ruth A. Murray, Portland School Department.

George D. Dorian, M.D., Bureau of Vocational Rehabilitation.

Peter P. Corato, Bureau of Vocational Rehabilitation, New Britain, Conn.

N. N. Marshman, United Cerebral Palsy Associations of Massachusetts. S. J. Liao, M.D., Easter Seal Rehabilitation Center, Waterbury, Waterbury Hospital.

Elizabeth Comfield, M.D., State Welfare Department.

Dr. Denis S. O'Connor, New Hampshire Area Rehabilitation Center, New Hampshire Curative Workshop.

Dr. Robeliff V. Jones, Grace New Haven Community Hospital, Yale University School of Medicine, Department of Physical Medicine.

Olga Gallan, Bureau of Vocational Rehabilitation, State Department of Education, Bridgeport, Conn.

Beatrice K. Bronson, State Department of Education, Hartford, Conn.

Amy L. Philips, Newington Hospital for Crippled Children.

Francis H. Harding, Massachusetts Rehabilitation Commission.

Thelma F. Parker, New Haven Rehabilitation Center.

Gertrude Norcross, Connecticut Society for Crippled Children and Adults.

Franklyn Graff, Board of Education, Westport, Conn. Gray H. Curtes, Vocational Rehabilitation Division.

Bruce Cole, Bureau of Vocational Rehabilitation, Connecticut.

Mildred Stanton, Connecticut Department of Education.

C. W. Goff, M.D., attending orthopedic surgeon, Newington Hospital for Crippled Children.

Thelma Parker (per E.C.), New Haven Area Rehabilitation Center.

Mrs. Dorothy Singer, Boston University School of Education Rehabilitation.

Philip Hallen, The Boston Dispensary.

Lorraine R. Loiacono, State Welfare Department.

John C. Allen, M.D., Hartford Hospital, Newington Hospital for Crippled Children, University of Connecticut, School of Physical Therapy.

Joseph E. Pauleat, Bridgeport Goodwill Industries.

John C. Horman, Jr., Goodwill Industries of America. Inc. Thomas F. Hines, M.D., Yale-New Haven Medical Center.

B. E. Foss, Newington Hospital for Crippled Children.

James B. Clemens, Newington Hospital for Crippled Children.

Mrs. John Langdon, Rhode Island Society for Crippled Children Meeting Street School.

Sarah C. Johnson, State Department of Health.

Mr. Elliott. Now, may I ask you, Miss Norcross, was your committee fairly unanimous in its recommendations?

Miss Norcross. Yes. We have a few points that I don't know whether you want me to take the time now or not to bring out which were just a little different than any of the points which have been discussed today.

Mr. Elliott. Will those be incorporated in the report?

Miss Norcross. They will.

Mr. Elliott. That will be fine.

Miss Norcross. If you would like to have a brief summary of what we are going to include in the report, I can give that to you now.

Mr. Elliott. All right, you may proceed, Miss Norcross.

Miss Noncross. The first thing that we would like to have you people consider is the fact that the handicapped are really a normal part of society, that we have orthopedic and neurological problems with us, we have always had them with us, and probably the rest of our lifetime we will have them with us.

The sooner we plan for these people the better it will be. We would like to have you consider, however, that the group talking this morning have been discussing the special services necessary to special

schools, and so forth.

We feel that except for the very seriously handicapped in the orthopedic and neuromuscular group that we would like to have facilities established so that these people can be integrated into the normal worklife as rapidly as possible so that they are not kept in special classes indefinitely and that when they do get older they will have an opportunity for employment.

We spent a great deal of time discussing the relationships in the field of special education and rehabilitation since they were both meet-

ing together in this committee.

The group felt that there was a very close approximation in the area of neuromuscular and orthopedic problems, but not necessarily in need of general consolidation at this time.

We felt that two separate activities should be carried on and that

it was not advisable to merge the programs on a Federal level.

When you receive our report, you will find our recommendations of need divided into three subgroups in order that we could get somewhere in this large field that would be understandable.

We have divided our report into treatment and service, education,

and research.

You will find that our recommendations in those three areas will be so divided.

Thank you very much.

Mr. Elliott. Thank you, Miss Norcross.

Now, our next witnesses will be the representatives from the group who studied the problems of the emotionally and mentally ill.

STATEMENT OF JULIAN S. MYERS, ASSOCIATE PROFESSOR AND COORDINATOR OF REHABILITATION COUNSELING AND TRAINING AT BOSTON UNIVERSITY

Mr. Elliott. What is your name, sir?

Mr. Myers. I am Julian Myers, associate professor and coordinator of rehabilitation counseling and training at Boston University.

Mr. Elliott. Mr. Myers, you will talk good and loud, will you not?

Mr. Myers. Yes, sir; I will try.

What I have just given you, sir, is a copy of the deliberations of our section on the mentally ill and what I would like to do is perhaps skim over this without emphasizing all the points, but perhaps putting some emphasis on what might be the most important elements.

Perhaps I should say in summarizing that from the general tenor of what we have reported, our conclusion would seem to be that with our present state of knowledge we can do a lot more in rehabilitating the mentally ill and emotionally disturbed than we are now doing.

We think that this will require more facilities and more well qualified personnel, personnel with what we would consider to be a re-

habilitation type philosophy.

We had to break our group down into two sections to get through within our period of time.

The first tend to focus more on problems of children and special

education.

The other is on problems of adult and rehabilitation, but we feel

they are closely allied.

As a working formula we used the general idea that emotional illness refers to individuals whose functioning is impaired because of emotional and mental factors, most often due to noxious interpersonal experiences, but which also may have biological and neurological sources.

It was felt by some members of the committee that a definition is not indicated in legislation any more than you would define diabetes

in legislation.

In other words, it was felt that a person diagnosed by a competent medical authority as being mentally ill would be a person who is mentally ill.

I am not sure there was complete consensus on this one point, but

I think on other points we had a fairly good consensus.

With relation to personnel it was pointed out that presently there are programs ranging from fair to excellent to train personnel in psychiatry, psychology, social work, and for some teachers in special education.

Our group felt that consideration should be given to Federal support of programs for the provision both of educators capable of training teachers and for the training of individuals to serve as child development personnel and teachers of special education, including, of course, teachers for emotionally disturbed children.

For this purpose we would hope that there would be support through the Department of Health, Education, and Welfare for research in setting up criteria for these personnel for workshops and demonstrations aimed at the high school and college level designed to attract suitable individuals to such professions.

Provisions with appropriate safeguards of scholarships or stipends on the college or professional school levels to attract qualified trainees.

Research in curriculum for the training of professionals including

both the academic aspects and the field training aspects.

Provisions of grants, either directly or through the State, to universities to provide instructors and to field training centers to provide necessary supervisors.

We find all too often the supervisors in the field work situation do not have the professional preparation and background needed to

supplement the training aspects.

The section dealing with children also stressed the need for the development of a new professional group which would be designated child care personnel. This type of personnel now exists in a wide

variety of situations, but there is no uniformity.

It was felt that in a variety of situations such as day-care centers, residential treatment centers, special schools and so on, there was a need for this type of person and that the quality of their professional skills would determine to a large extent whether the children were helped or not.

Therefore, it was proposed that support be given, first on a trial basis and then if warranted on a continuing basis, for some joint arrangements between universities and treatment centers to establish a 2-year master degree program in child development and child care.

The universities would provide the appropriate professional courses including areas of psychology and dynamics while treatment centers would provide the supervisory learning experience.

This program would call for stipends for the trainees and provision

for salaries along with appropriate overhead.

Turning next to service provisions, it was the feeling of the group that in order to encourage the States to act in accordance with a wide comprehensive view of disability that Federal legislation clearly should state that emotionally disturbed and handicapped children are not excluded from, but are to be considered within and among the generally recognized categories of exceptional and handicapped children for all existing and contemplated special provisions and laws.

In other words, there is a feeling that sometimes the emotionally disturbed child and perhaps other categories tended to be left out of

legislation.

We would like to see this legislation as all-embracing.

We have included a tentative draft of a type of State aid program which we think is necessary in meeting the needs of the preschool child with emotional difficulties. That is contained in the report, and

I won't go into it.

The next point, I had better read this. Children in adolescence who are hospitalized in long-term and short-term institutions are often deprived of necessary education advantages as many communities either do not recognize their need or feel it is not in their province or they cannot afford this.

Therefore, it was proposed that grants be made available for partial reimbursement to States or to local communities or to institutions for the provision of educational services for school age children in adolescence who are confined to those hospitals or to residential

treatment centers under public or private auspices.

In other words, we feel that these children need educational services as well as therapeutic services and they are not getting very much of this nature.

The section recognizes the existence of a problem which is poorly dealt with at the present time, which is primarily a diagnostic problem related to children under the age of 6 who come to attention because of deviant behavior.

Single visits are not adequate to come up with a proper diagnosis

and to come up with proper treatment specifications.

Experience with these children suggests that proper diagnosis requires that they be observed in a controlled group setting over a extended period of time.

Then the diagnosis would be based on interaction with children,

adults, behavior and so on.

It also involves work with parents, psychotherapy medication, and

so on

In this process we would hope to avoid hospitalization as much as possible for fairly obviously reasons and it is felt that this sort of diagnostic service and treatment could best be supplied by a therapeutic diagnostic nursery school type of program,

This, in turn, would require specially trained nursery school teachers, psychiatric, psychological, and social caseworker and group work

personnel.

This is a fairly expensive program, we recognize, and would require subsidization if it were to be put into effect on a fairly appreciable basis.

We see two possible resources for such programs, the maternal child health title under the Children's Bureau program and community health projects under the NIMH grants.

We hope this could be strengthened by specific allocation.

Turning to the utilization of pilot and demonstrations projects which are now sponsored by various agencies of the Department of Health, Education, and Welfare, we feel these are very valuable things and many of them are coming up with important findings and indications for future forms of treatment.

However, currently, when the Federal support for these projects is terminated the whole project is all too often terminated and we would like to see further support in two ways. To provide for continuation of these projects long enough to provide sufficient opportunities for local or State funds to be developed to maintain them.

This would be a matter perhaps of a couple of years.

Or to provide funds to make it possible for other States and communities to adopt and to adapt this new information, the techniques, and the program which are demonstrated as making significant contributions.

So it is felt that the legislature should give serious consideration

to the possibility of providing additional funds in these areas.

Otherwise, we feel that some of the important findings will be wasted. To determine which project should get further support there might be a board of review set up which would pass on the merits of these projects.

On our committee I was aware of the limited number of professionals available in any community for the increasing and diverse

needs being proposed.

We would suggest as far as possible that Federal legislation encourage the States to develop programs which join with others to use in common such scarce personnel as psychiatrists, psychologists, special education people, and rehabilitation personnel.

We would not like to see each agency compete and segregate its

services.

Mr. Elliott. Thank you very much, Mr. Myers. We have enjoyed your report.

I will ask you the question: Was it fairly unanimous?

Mr. Myers. Yes, sir. We had a good deal of unanimity as you can see from the report. I have not completed the section on rehabilitation aspects.

It is contained in the report, however. Mr. Elliott. Thank you very much. (The report referred to follows:)

WORKSHOP REPORT ON EMOTIONALLY DISTURBED AND MENTALLY ILL

I. DEFINITION

The section is of the opinion that there is no special need to define the above categories other than in an operational way, any more than a diabetic person may be defined as one diagnosed by competent medical authority as suffering from the disease called "diabetes". In the same way, persons may be defined as emotionally disturbed or mentally ill if they are so diagnosed by competent medical authority.

In passing, it may be stated that this refers to individuals whose functioning is impaired because of emotional and mental factors, most often due to noxious. interpersonal experiences, but which also may have biological and neurological

sources.

II. PROVISION OF PERSONNEL

(a) There are at present programs of varying degrees of adequacy for the training of personnel in the fields of psychiatry, psychology, and social work and for the teachers of some kinds of exceptional children.

This committee feels that consideration should be given to Federal support of programs for the provision both of educators capable of training teachers and for the training of individuals to serve as child development personnel and teachers of special education, including particularly teachers for emotionally disturbed children.

This would involve support through the Department of Health, Education, and

Welfare for programs such as these:

1. Research in criteria for the selection of the best suited individuals for re-

cruitment for such professions.

2. Workshops and demonstrations of materials, aimed at both the high school and the college levels, designed to attract such suitable individuals to such professions. 3. Provisions (with appropriate safeguards) of scholarships or stipends on

both the college and professional school levels to attract such qualified trainees. 4. Research in curriculum for the most efficient training of such professionals,

including both diversified courses in the universities and varieties of practicumfield training. 5. Provisions of grants (directly or through the States) to universities to

provide such instructors and to field training centers to provide the necessary supervisors and supporting personnel in such areas.

(b) The section desires to stress the need for the development of a new pro-

fessional group.

There has been an increasing need to place children, incapable of being helped solely by individual approaches, in an ever-increasing variety of group situations including day care centers; residential treatment centers; children's villages;

special schools; children's wards or children's units of State or of private mental hospitals; and State training schools and other institutions for delinquent children.

In such institutions, a major part of the care of such children and of the treatment which will help to determine the success or failure of such placement, is provided by personnel given various titles, but who may be grouped together under the overall designation of child care personnel.

These individuals come from a variety of backgrounds but are generally without any formal training. They are expected to perform like professionals and truly could represent a new and valuable profession if adequately trained.

It is proposed that support be given, first on a trial basis and then if warranted, on a continuing basis, for some joint arrangement between appropriate universities and residential treatment centers to establish a 2-year master's degree, postgraduate program in child development and child care. The universities would provide the appropriate professional courses in child development, normal and abnormal psychology, group dynamics, etc., while the residential treatment centers would provide appropriate supervised learning experience.

This would call for stipends for the trainees and provision for salaries of instructors in the universities and supervisors and supporting personnel in the

field training center, along with appropriate overhead.

III. PROVISION OF SERVICES

A. In order to encourage the States to act in accordance with such a wide view, the section suggests that Federal legislation clearly state that emotionally disturbed and handicapped children are not excluded from but to be considered within and among the generally recognized categories of exceptional and handicapped children for all existing and contemplated special provisions and laws. Examples include the provision of home teaching and services of school social workers; special classes; services of special personnel and consultants, such as psychologists and psychiatrists; summer program; purchase of such necessary rehabilitative services as individual psychotherapy.

As a further example of the type of State aid programs which should be supported by some Federal reimbursement, the section appends and endorses the following proposed draft act for the Commonwealth of Massachusetts prepared by the Massachusetts chapter of the National Organization for Mentally III

Children:

"INTERIM REPORT OF THE COMMITTEE ON LEGISLATION REGARDING SPECIAL EDU-CATION FOR EMOTIONALLY DISTURBED AND MENTALLY ILL CHILDREN

"Legislation to extend special educational and other benefits, comparable to those now available to other handicapped children, should include the following:

"I. DIAGNOSIS

"In order to qualify for aid under the following sections, a child must be diagnosed, according to regulations prescribed by the departments of education and of mental health, as emotionally disturbed or mentally ill to such an extent that his needs for specialized training or teaching cannot be met in a school class for normal children.

"II. DAY CLASSES

"The school committee of any city, town, or regional school district having resident therein any child, diagnosed as emotionally disturbed or mentally ill according to section I, shall, upon request of the parents or guardian of such child, provide a day program for training and education of such child in one of the ways set forth in subsections A, B, and C hereof:

"A. The school committee of any city, town, or regional school district may establish special day classes for emotionally disturbed or mentally ill children, under regulations prescribed by the departments of education and of mental

health.

"B. Any city, town, or regional school district may join with one or more other towns, cities, or regional school districts to establish special day classes for emotionally disturbed or mentally ill children, under the regulations prescribed by the departments of education and of mental health, the cost of conducting such classes to be apportioned by agreement among the towns, cities, and districts so joining.

"C. Any city, town, or regional school district may send such child to day classes for emotionally disturbed or mentally ill children conducted within a reasonable distance from the child's residence, by any agency approved by the departments of education and of mental health, and may pay reasonable and necessary amounts as tuition to such agency.

"D. Any city, town, or regional school district may provide, or pay the reasonable cost of, transportation to and from special day classes for emotionally disturbed or mentally ill children resident therein attending such classes.

"E. Any city, town, or regional school district providing for special education of its resident children under sections A, B, and C, or transportation under section D shall be entitled to reimbursement by the Commonwealth for one-half the cost of such special education and transportation.

"III. RESIDENTIAL SCHOOLS

"The department of education or the department of mental health may, upon the request of the parents or guardians, send an emotionally disturbed or mentally ill child, for whom residential care is required or recommended by a competent diagnostic authority, to a residential agency, within or without the Commonwealth, approved by the department of educational and mental health as qualified to provide an adequate remedial and educational program for such child. The reasonable and necessary expenses for care and training of such child at such agency including his necessary transportation expenses shall be paid by the Commonwealth, but the parents or guardians of such child who are able wholly or in part to provide for his support and care, may be required to reimburse the Commonwealth therefor to the extent of their ability.

"IV. Any agency providing special day classes or residential remedial and educational programs for emotionally disturbed or mentally ill children may pay to persons caring for, teaching, treating, or supervising such children, compensation in excess of established salary scales for teachers in public schools for normal children. Such compensation, if commensurate with the specialized training and experience of such persons, shall be considered a reasonable and

necessary expense.

"B. Children and adolescents who are hospitalized in short- and long-term institutions are often deprived of necessary educational advantages as many communities either do not recognize their need or feel it is not in their province

or that they cannot afford this.

"Therefore, the section proposes that grants be made available for partial reimbursement to States or to local communities, or directly to institutions involved for the provision of educational services for school-age children and adolescents confined to hospitals (including psychiatric among them) or to residential treatment centers, whether under public auspices or under private (but nonprofit) auspices.

"C. The section recognizes the existence of a problem which is poorly dealt with at the present time. There are an increasing number of children under 6 years of age who come to attention because they are deviant in bahavior. When seen on a single visit basis, or even on several visits, on an individual basis, by appropriate and skilled professions, they may be variously diagnosed (depending upon who sees them) as psychotic, brain-injured, mentally retarded, or a com-

bination of these."

Experience with these children suggests that proper diagnosis requires that they be observed in a controlled group setting over an extended period of time, such diagnosis being based partly upon their interaction with other children, as well as with adults.

It also suggests that proper treatment of these children requires the use of such a controlled group environment over long periods of time, as well as work with the parents, individual psychotherapy with the child, and possibly the

use of medications as well.

As there are a number of reasons for avoiding total hospitalization of children under 6 years of age, the environment required for both diagnosis and treatment may best be supplied by the provision of a therapeutic-diagnostic nursery school program.

This requires the provision of specially trained nursery schoolteachers and psychiatric, psychologic, and social caseworkers and group work personnel. The resulting care is much more expensive than that in the average nursery school and subsidization is required.

There are at present two possible resources for such programs: the maternal-child health title under the Children's Bureau program and the community mental health projects under NIMH grants. These could be strengthened by specific allocation.

IV. MEANS OF BETTER UTILIZATION OF PILOT AND DEMONSTRATION PROJECTS

There is considerable concern about the need to provide means of further extending and implementing programs of special education and rehabilitation (including direct treatment services) which are developed as demonstration projects, pilot studies, and research programs. Under current practice, termination of the project itself. It seems that further support is needed in two ways:

First, to provide for continuation of these projects long enough to provide sufficient opportunity for local and/or State funds to be developed to maintain them which is usually several years beyond the demonstration aspect of the

special program.

Second, to provide funds to make it possible for other States and communities to adopt and adapt new information, techniques, and programs already demonstrated as being able to make significant contributions in the fields of special edu-

cation and rehabilitation.

It is felt that the legislature should give serious consideration to the possibility of providing additional funds to meet the needs in these two areas. Without such funds for implementation it would seem that a significant portion of currently expended funds for research and demonstration or pilot programs in essence are not being fruitfully utilized.

One possible means of accomplishing this might be the establishment of boards of review similar to the reviewing boards currently allocating funds on the research and demonstration level, to recommend allocation of these funds on an

extended support basis.

V. JOINT USE OF PERSONNEL

The committee is aware of the listed number of professionals available in any community for the increasing and diverse needs being proposed. It suggests that as far as possible Federal legislation encourage the States to develop programs which join with others to use in common such scarce personnel as psychiatrists, psychologists, social workers, special education, and rehabilitation personnel.

Mentally ill (rehabilitation aspects)

Personnel.—It is the feeling of the section that many more mentally ill people can be rehabilitated than is currently the case. It is our opinion that this can best be done by the development of comprehensive mental health teams within the hospitals and by coordinating the efforts of these teams with existing vocational rehabilitation service. Therefore, it is recommended that the Federal Government set up mental health grants to be made available to the States, for the purpose of developing and supporting within mental hospitals—

1. Rehabilitation teams, including such professions as psychiatrists, psychologists, vocational rehabilitation counselors, social workers, nurses, phys-

ical therapists, and occupational therapists.

Corresponding rehabilitation services such as therapy, vocational counseling, vocational training, education, social services, and recreational services.

In order to stimulate and encourage the recruitment of qualified rehabilitation personnel, it is recommended that the training aspects of Public Law 565 be revised so that traineeships can be made available to undergraduate students in their junior and senior years, provided that these students are both highly qualified for rehabilitation work and highly motivated to enter the field. Such traineeships would be in addition to the graduate level traineeships and work require an extension of the 2-year limitations that currently exist. The undergraduate training, where applicable, should be structured to prepare the individual for graduate specializations, as for example in the rehabilitation counselor programs.

A pressing need exists for the establishment of new mental hospital facilities. In order to encourage the States to develop such new facilities, it is recom-

mended that the provisions of the Hill-Burton Act be modified to provide a more favorable formula to the States for the building of new facilities for the mentally ill and for the establishment of rehabilitation services in these facilities.

Gradual transition from hospital to the community is often a vital part of the rehabilitation process. The halfway house offers certain patients such a gradual transition. It is recommended that the States be encouraged to set up halfway houses to further the social and vocational rehabilitation of the institutionalized menally handicapped population, through current or proposed Federal legislation.

Services.-It is recommended that the name of the President's Committee on the Employment of the Physically Handicapped be changed to the President's Committee on the Employment of the Handicapped so as to include those individuals with mental handicaps.

It is recommended that current rehabilitation legislation be modified so that the State vocational rehabilitation agencies will be given greater latitude in providing services to disabled individuals who may be able to achieve physical and social independence even though they may not necessarily be employable after such services have been provided.

In determining an applicant's eligibility for financial assistance under Public Law 565, the Division of Vocational Rehabilitation may exclude as "available resources" a moderate amount in liquid assets in order to provide a reasonable degree of economic stability and for a reserve for unexpected emergencies. strongly believe that rehabilitation clients while in active status should have

the same degree of economic stability and reserve for emergencies.

Therefore, we recommend that Public Law 565 be amended to permit vocational rehabilitation clients who as applicants are devoid of such assets, but who while in active status become earners to accumulate from their earnings liquid assets equal to the amount which the State rehabilitation plan would have permitted them to exclude as "available resources" while they were applicants.

General .- The policy of an open-end grant currently being used for public assistance funds has the advantage of encouraging the States to expand the program involved. Therefore, it is recommended that grants made to the States for vocational rehabilitation be made through open-end appropriations so that

there will be an inducement to the States to enlarge their services.

We believe that the existing policy of the Office of Vocational Rehabilitation requiring matching funds on the part of agencies undertaking research and demonstration projects should be continued where there is an established basis for local financial support. However, we feel that many valuable projects, particularly in new areas, are excluded from consideration because matching funds are not available. Therefore, we recommend that the Office of Vocational Rehabilitation should be authorized to contract and pay for the entire cost of research projects, when this research is considered desirable but matching funds

are not available.

While this section of the New England study group has been considering the needs of the mentally ill in the areas of special education and rehabilitation, we support the principle of coordination and integration of programs and serv-In general, we feel that it is not desirable to meet the needs of special disability groups in isolation if such needs can be met in conjunction with services offered to other disability groups. We feel that fragmentation of services, proliferation of services, and the establishment of competing services should be avoided whenever possible. We favor the intelligent, constructive use of all community agencies such as clinics, schools, departments of education, family agencies, and child guidance clinics whenever they can contribute to comprehensive rehabilitation. We support the principle of integrating special education services with rehabilitation services so that the disabled individual will receive optimal support and assistance in the form of a comprehensive program that will enable him to take his place in the community as a selfrespecting, self-sufficient citizen.

Mr. Elliott. Our next group is that of the gifted.

Will the person designated to speak and present the report from that section of the workshop please come around.

STATEMENT OF PEARL ROSENSTEIN, ON BEHALF OF THE WORKSHOP STUDY COMMISSION ON THE GIFTED

Mrs. Rosenstein. I am Dr. Pearl Rosenstein. I am associated with Southern Connecticut State College.

Mr. Elliott. Now, Doctor, what was your name, again?

Mrs. Rosenstein. Dr. Pearl Rosenstein, assistant professor, Connecticut State Teachers College, and principal of the Barnard Laboratory School, where we have done considerable research in the area of gifted.

We know that today the educational system throughout the United

States faces many crucial issues and also criticisms.

One area in which we are greatly concerned is the area of losing so many of our very bright youngsters who enter high school and then fail to go on beyond high school education. Statistics have indicated that 50 percent of the top one-third of our young people who should go on into higher education are not, and that we are losing in this group many potential leaders not only in the sciences, but in government, religion, education; in the social service work, in economic and many other areas, and this is a pitiful waste of human resources in our own country.

Mr. Elliott. Dr. Rosenstein, did your group consider the impact that the National Defense Education Act is making in that field?

Mrs. Rosenstein. Yes. The basic report of the committee is recommendations for revision of certain areas of the National Defense Education Act. One of the things we are greatly concerned with is this comparative criticism of our own system of education with that of other systems throughout the world, especially the European and the Russian system of education.

Now, we differ in our philosophy of education. We know that here in the United States we attempt to educate more young people at a higher level of education than any other country in the world, that ours is a universal system of education as compared with the European

system usually called the elite system of education.

If you were to visit Russia today in their schools their philosophies are one of cohesiveness where most people all work for the state, that the individual has very, very little bearing as an individual and only as he can contribute to the state.

This is their basic philosophy of education.

If you move over into England you will find that the English basic philosophy of education is one of character education, where if you

educate the character you educate the mind.

Mr. Elliott. Dr. Rosenstein, I agree generally with what you are saying about the Russian system of education, but I am impressed very much by the fact that Russia last year graduated about a half million people more from its high schools than we graduated from our 27,000 high schools.

Mrs Rosenstein. One of the reasons, of course, is population.

Their numbers are greater.

Mr. Elliott. But that half million might offset that difference in population just about and would indicate that they are steering sharply now from the selective education that most of the European countries have had all along over to a system of somewhat democratic education.

At least, I have that impression from the study that I have made of it.

Mrs. Rosenstein. Yes.

Another thing I think we have to consider is that their type of graduates, for example, those youngsters who go into their technical schools, their middle class, are considered scientific material, wherein in our schools they would be mechanical engineers of some kind.

There is a terminology we have to be concerned with, too, as well

as some of the facts and figures.

But our concern is with our own group of young people whom we are losing on the higher level of education. This is primarily due to three major reasons as we can see them in the field of education.

One is lack of motivation. There is something that these people

lack in wanting to go on.

Second is the lack of preparation.

Third is the lack of financial means of doing it.

Now, the area of preparation and motivation I feel is primarly the concern of the administrators and educators in our schools. We need to revise our programs of education. We need to build new courses study and new curriculum.

We have to devise new means of motivating these youngsters so that

they do develop love of learning.

All of this requires research of one nature or another, pure and

practical research. This is our great concern.

Although there has been an upgrading on the secondary level, that is, there has been more financial means made available through the merit scholarship program, through private industry, through colleges and universities, we feel that waiting for these youngsters to get into the secondary school is too late.

The area for identification of these youngsters must be on the elementary level. This is one of the great needs, a revision of the programs and means of identifying youngsters on the elementary

level as they enter elementary schools.

We know, those of us who are associated with schools, that study habits and basic skills are usually developed at age 7, 8, and 9. It is too late to wait to give them that type of training when they get into the intermediate grade or into junior high school.

So we must find ways and means of identifying these youngsters at a very early age. This is where we call upon the committee to help

us and to assist us.

Now, this report is a compiled report, a unanimous report of a group representing many universities and colleges in New England, high schools, in New York and New England, institutions as well as

private and public school systems.

We have had, I might add, one of the most interesting sessions I have ever attended in any college or university courses. I think that in this type of meeting that we attended our exchange of opinion was more valuable than any I have ever attended before. It was a privilege to be able to sit in and meet some of the people and exchange ideas with them.

However, I do not want to take too much of your time. These are the recommendations that this committee has made for the gifted: First, we have today techniques for identification of the gifted.

Those are available. They are becoming available to secondary schools through title V of the National Defense Education Act.

However, this is in the secondary area only.

I try to point up the need on the elementary level.

Second, we would recommend modification in this law to allow financial assistance for testing upon admission to public schools for identifying the gifted at the time when much can be done for them.

Third, we have today techniques and we have teachers who are capable of providing adequate instruction for the gifted but these pro-

grams which have started are too far and few between.

What we do need is a greater introduction of new programing for gifted throughout the United States. Those of us in New England who have been doing research on the gifted have had hundreds of letters this past year many of which came from Hawaii and Panama Canal Zone, Alaska, Canada, New Zealand, and many other areas of the world, requesting the new curriculum guide which we have developed for our children, requesting their characteristics, their identification of high abstract reasoning that these youngsters have, their retention expanse, and we have forwarded this material, but we are limited in the amount.

The important thing is to recognize that there is an awakening and there is a request and there is seeking of information in how to deal

with this very important problem.

Therefore, what we need is funds to assist in the conversion of existing school programs to allow for better instruction of the gifted.

Fourth, we have today programs such as the St. Paul School program for advanced studies in New Hampshire which provides for young people of high intellectual capacity in isolated areas who do not have the advantages of a large school system, and they meet during a summer institute where they are motivated and challenged and work with each other under able leadership.

This is the type of program we need to develop in many more rural

communities throughout the United States.

Now, on the elementary level theret are some very good programs here in New England; Brockton, Malden, and New Haven have done considerable research. However, they are quite inefficient in that there is a lack of continuity and distribution of the essential material that comes out of these programings.

Therefore, we would recommend that provision of the national and regional centers to provide leadership and consulting services for the

assistance of existing programs and stimulation of new ones.

Fifth, we have a very limited amount of research today completed and some in progress concerning the nature of gifted. We are organizing programs in helping teachers to better understand the gifted children, but what we do need is a great deal more research at the theoretical and practical levels to provide educators with a broad understanding of giftedness.

Now, in titleV of the National Defense Act this provides for train-

ing and guidance, counseling and testing of gifted children.

However, there is a need for more specialists to be included in this act, and this would include school psychologists, administrators, and classroom teachers, in order to broaden the program to include people who are and can be trained to identify and guide the gifted.

Last, the increasing number of gifted children who will be identified and are being identified in early childhood and elementary school require, as they enter and pass through high school, a more broadened aid program for financial assistance.

It seems almost impossible now that private industry and private scholarships will be able to meet the need of these young people who will eventually reach the high level in the high school range.

Therefore, we recommend a scholarship program on a national basis to insure a full secondary school opportunity for the gifted.

(The report referred to follows:)

NEW ENGLAND REGIONAL WORKSHOP IN SPECIAL EDUCATION AND REHABILITATION—(COCHAIRMEN: ROBERT M, KELLOGG AND R, PHILIP HUGNY)

Area: The gifted

What we have	How do we use it	What do we need
Tests and techniques for identifi- cation of giftedness are available.	These are becoming available to secondary schools through title 5 of the National Defense Education Act.	Modification in this law to allow financial assistance for testing upon admission to public schools, for identifying the gifted at the time when much can be done for them.
2. Techniques and teachers capable of providing adequate instruction for the gifted.	Local programs of instruction for a group of gifted students within a school system.	Funds to assist in the conversion of existing school programs to allow for better instruction of the gifted.
 Programs such as the St. Paul's School advanced studies pro- gram in geographic areas where local programs are lacking. 	Provision of educational oppor- tunities for gifted high school students which are unavail- able to them in their own schools.	Provision of scholarship funds to allow gifted secondary school students to take part in sum- mer programs approved by the Office of Education.
 A number of good but isolated programs of special education for the gifted in various sections of the country; i.e., Brockton, Malden, and New Haven. 	With considerable inefficiency as liaison between them is negligible.	Provision of national and re- gional centers to provide leadership and consulting serv- ices for the assistance of existing programs and the stimulation for new ones.
5. A very limited amount of research completed and in progress concerning the nature of giftedness.	In organizing programs and in helping teachers to better un- derstand the gifted children in their classes.	A great deal more research at the theoretical and practical levels to provide educators with a broad understanding of gifted- ness.
 Title 5 of the National Defense Education Act provides training in guidance, counseling, and testing of gifted children. 	To provide guidance training for a limited number of persons with particular qualifications.	A broadening of this program to include the following persons who are involved in identification and guidance of the gifted: 1. School psychologists. 2. Administrators. 3. Classroom teacher.
Increasing numbers of gifted chll- dren graduating from programs in the elementary and second- ary schools.	To prepare these young people for superior performance at the post-secondary-school level.	A scholarship program on a na- tional basis to insure post-sec- ondary-school opportunities for the gifted students.

ATTENDANCE SHEET

Nicholas J. Wells, State department of education. Irene Feltman, Southern Connecticut State College. Clara M. Thurber, dean, Lesley College.

Edward Frankel, Bronxville High School of Science.

Frederick Jervis, director of counseling services.

R. Philip Hugny, St. Paul's School, advanced studies programs. Pearl Rosenstein, Southern Connecticut State College and New Haven public schools.

Arlene J. Walton, director of testing, Malden public schools.

Abraham M. Zeichner, clinical psychologist, Connecticut State department of mental health.

Edward Gordon, director, office of teacher training.

Dorothy E. Sharples, art director, chairman of curriculum commit-

Derwood A. Newman, superintendent, Needham public schools.

Roberta M. Kellogg, associate professor, Brown University.

Mary Martin, assistant principal.

Bertha Carter, director of education for physically handicapped children.

Margaret Otto.

Dr. Gall.

Dr. Frampton.

Mr. Light, liaison person with the Association for the Gifted.

Mr. Elliott. Thank you very much.

Our next group is that of the work with visually impaired.

STATEMENT OF FREDERICK GREEHAN, ON BEHALF OF WORKSHOP, STATE COMMISSION ON THE VISUALLY IMPAIRED

Mr. Greehan. Mr. Chairman, members of the subcommittee, my name is Frederick Greehan, in official capacity supervisor of the rehabilitation bureau in the Massachusetts Division of the Blind.

Our group as yet has not finalized its written report; it is in the process of preparation. We would request permission to file it in written form within the very near future.

Mr. Elliott. Without objection the written report will be made a

part of the record when it comes in.

Mr. Elliott. Now was the report fairly unanimous, Mr. Greehan? Mr. Greehan. Yes, Mr. Chairman, it was unanimous on over 20 proposals and specific recommendations that we have to make. On the one other proposal there was a substantial majority and on only one proposed suggestion did the group turn it down.

On behalf of the workshop I would like to express the thanks of our group for this opportunity to get together in a workshop of this type. We feel it was a wonderful opportunity because in our group we had 36 persons present representing all of the New England States and a

few persons from outside of the New England area.

Now under the rehabilitation side of this situation we had several proposals, but due to the lateness of the hour I would like to mention only three that refer to material that has not been covered here

today in one form or another.

An unmet need concerned the vending stand program of the blind. The proposed solution the group is making is that Public Law 732, as amended, the so-called Randolph-Shepherd Act, be further amended to preclude income from vending machine and public buildings accruing to any group other than the blind vending stand operator in that particular building.

With respect to the independent living type of legislation, the workshop wished to record itself as being in favor of this type of legislation and the theory behind it and the group commended the idea of extension of services to more clients, but expressed the strong hope that such an extension of services would not destroy or materially interefere with the present vocational rehabilitation program.

Another recommendation on the rehabilitation side is that the Federal Office of Vocational Rehabilitation sponsor on a regional basis

biennial meetings of State rehabilitation staffs along with OVR personnel to exchange information and discuss current and proposed techniques in the field, this to be done on a grant basis so that the idea that the State personnel have in obtaining permission to travel out of the State would be overcome.

And, a further recommendation that the Office of Vocational Rehabilitation sponsor college-operated courses in small business enterprise operations, including vending stands similar to the course now operated by placement counsel for the blind at Southern Illinois

University.

Briefly, just a few of the recommendations made for special education of the visually impaired group. There was a great discussion of the teacher shortage situation in this area, as well as in other areas, as we have heard here today.

The shortage of qualified teachers is not confined to the education of handicapped children, but the feeling was that its effects were

perhaps more serious in this area.

The group waited to recommend that in addition to a consultant recently appointed to the Office of Education for exceptional children, that a highly qualified staff be added to this particular section and include in the responsibilities of this staff a nationwide study of educational services offered blind children with particular reference to the problems of training teachers adequately to teach the blind and the duty of recommending desirable standards to State departments of special education.

Also, it was recommended that Public Law 85 be amended which deals with the expansion of teaching in the education of mentally retarded children through grants to institutions of higher learning.

and State educational agencies.

It was proposed that this law be expanded to provide similar services to teachers of blind children or as an alternative new legislation

be submitted to accomplish the same end.

There were proposals concerning the shortage of nonteaching professional personnel which would include such persons as psychologists, social workers, educational counselors, speech therapists, and so forth.

It was recommended that the aforementioned consultant and proposed staff in the Office of Education make a study of this situation,

as well.

With respect to the shortage of books and other educational material in public school classes it was felt that this was mainly due to the difficulty of supplying one or several copies of the text on short notice. The workshop recognized that legislation along this line is going to be submitted to Congress in 1960, but wished to go on record with this proposal, that the act to promote the education of the blind under which the American Printing House for the Blind at Louisville, Ky., supplies books and materials to the school, be amended to permit Federal funds to be used for the expenses of specialists or consultants to work both at Louisville and in the field on such technical problems as title selection, anticipation of needs, improved methods of production, problems of distribution, education and research and cooperate with volunteer transcribers.

The present authorization of \$400,000 annually should be increased to whatever sum is needed and the workshop draws particular attention to the needs of partially seeing children for more large type books. I believe that will conclude my brief summary.

Mr. Elliott. Thank you very much, Mr. Greehan.

(The report referred to follows:)

REPORT OF WORKSHOP ON REHABILITATION OF THE VISUALLY IMPAIRED

Cochairmen: Mr. Frederick D. Greehan, Dr. Edward J. Waterhouse.

It is a great pleasure to make this report of the workshop on rehabilitation of the visually impaired to the Subcommittee on Special Education of the Committee on Education and Labor of the U.S. House of Representatives. There were 31 persons present at this workshop session, with at least 1 representative present from each of the 6 New England States, as well as 2 persons who came as observers.

The workshop group adopted proposed solutions to 15 unmet needs in the field of rehabilitation of the visually impaired. Of these 15 proposed solutions, the vote to adopt the proposed solutions was unanimous on 14 of them. The group voted down the proposed solution to one unmet need and this suggestion is filed

as a minority report.

Of the 15 unmet needs with their proposed solutions, 4 of them dealt with changes in Public Law 565, 2 dealt with the Office of Vocational Rehabilitation, 1 dealt with mobility training, 1 dealt with Hill-Burton Act, 1 dealt with vending stands for the blind, 4 dealt with title X on aid to the blind under the Social Security Act, 2 dealt with title II on social security benefit payments under the Social Security Act. The minority report dealt with Public Law 565.

The workshop group on unmet needs of visually impaired persons which met at Yale University wished at the outset to record itself as being in favor of rehabilitation in its broadest possible meaning. The group decided to adopt the

following definition of rehabilitation:

"Rehabilitation is the process of restoring the handicapped individual to the

fullest physical, mental, social, vocational, and economic usefulness."

The workshop group then dedicated itself to the task of pointing out what it considered the unmet needs in the field of rehabilitation of the visually impaired in the New England region. The workshop attempted to be as specific as possible without giving the costs involved in any of its proposals since they would be too difficult to determine within a reasonable degree of accuracy.

Unmet need No. 1. Change in Public Law 565 concerning small business enterprises program.—Several persons expressed dissatisfaction with the present provisions of Public Law 565 with respect to the inability of the State agencies to pay for items such as rent and utilities for more than a period of a month and for the renting of operational equipment for more than a period of 4 months. Rehabilitation personnel believe that these limitations are pennywise in that they may so hamstring the blind person who is being helped in a business project

that they could possibly contribute largely to the failure of the business.

Proposed solution: Public Law 565 and its attendant regulations should be amended so that the State vocational rehabilitation agency may be authorized to pay necessary operational expenses for blind clients engaged in small business

enterprise programs for a period not to exceed the first 12 months.

Unmet need No. 2. Change in Public Law 565 concerning small business enterprise program.—People from different States expressed dissatisfaction with the provisions of Public Law 565 which relate to the provision of maintenance following the placement of a client. Under the present law it is necessary to discontinue his maintenance either at the time he receives his first paycheck or at the end of 30 days, whichever occurs sooner. This has created an injustice for many blind clients who are being set up in a business enterprise and who may have had to move considerable distance from their home location in order to begin such a business.

Proposed solution: Public Law 565 and its attendant regulations concerning provision of maintenance should be amended to provide that "a reasonable period of time following placement" be interpreted to permit State vocational rehabilitation agencies to provide maintenance for clients for a period not to exceed the first 12 months following job placement, rather than the current maximum period

of 30 days.

Unmet need No. 3. Strengthening of Division of Services to the Blind in the U.S. Office of Vocational Rehabilitation.—There is inadequate understanding on the part of rehabilitation personnel who do not specialize in services to the blind of the special problems which result from blindness and the techniques of helping to meet these problems.

The fact that blind persons comprise only a small portion of the handicapped persons served under Public Law 565 makes it impossible for administrative personnel responsible for the operation of the total Federal-State rehabilitation program to devote sufficient time to the special needs of blind persons to become adequately familiar with the best means of meeting their needs and helping them achieve their optimum potentialities. Thirty-seven States now have specialized rehabilitation agencies for the blind. The remaining States should be encouraged

to establish specialized agencies as soon as practicable.

Proposed solution: The U.S. Office of Vocational Rehabilitation should strengthen its services to the blind, and assign one full-time consultant on services to the blind to each of its regional offices. In addition, the Division of Services to the Blind in the central office should be strengthened. At present the regional representatives of the Office of Vocational Rehabilitation are in no way responsible to the Chief of the Division of Services to the Blind. This relationship should be changed so that the Chief of the Division of Services to the Blind would have more than a consultative role in planning and policy determination regarding problems of the blind.

Unmet need No. 4. Shortage of mobility instructors and need for mobility training.—There was considerable discussion about the importance of mobility training for blind persons as a necessary part of any vocational or total rehabilitation process. The group recognized the fact that work is now going on which hopefully will result in the creation of training programs which will provide

more qualified mobility instructors for use in the various States.

Proposed solution: The group wished to record itself as being unanimously in favor of all such action which will promote the increased ability of blind persons

to obtain mobility instruction from qualified teachers.

Unmet need No. 5. Lack of facilities to provide necessary rehabilitation services for blind persons.—The Hill-Burton Hospital Construction Act of 1954 has been a wonderful help in establishing certain rehabilitation facilities. Experience under this act has revealed that most centers established are medically oriented to a large degree. The group felt that this was fine as far as it went, but that it did not go far enough.

Proposed solution: Broadening the Hill-Burton Act to provide equipment and facilities, other than those operated under medical sponsorship, necessary to rehabilitation or special education programs for the blind, such as diagnostic and treatment centers for blind children and youth, rehabilitation centers for blind

adults and special workshops for blind persons.

Unmet need No. 6. The need to improve the Randolph-Sheppard Act (Public Law 732 as amended).—The Randolph-Sheppard Act was originally set up as a means of providing one of the most meaningful opportunities for the employment of blind persons, and over the years has accomplished a great deal toward this However, during this time there has been increasing evidence of the encroachment of vending machines in buildings where the vending stand was or could be made adequate to provide for the occupants of the building. It is felt that pressures have been brougth to bear on the officials in charge of the building, resulting in making it difficult for blind persons to have the opportunities which Congress intended. There is no desire, however, on the part of those working with the blind nor on the part of blind vending stand operators to insist on stands being set up where a cafeteria is clearly indicated, but many blind persons can and do successfully operate snack bars which market a much larger variety of goods and foods than that originally contemplated in the Randolph-Sheppard The device of utilizing vending machines has in some instances been employed in order to divert income to purposes other than those authorized in the

Proposed solution: Public Law 732 should be amended (a) to preclude the income from vending machines accruing to any group or purpose other than to the blind operators. Further, the installation of such vending machines should be limited to areas which are not feasible for vending stands; (b) to expand the definition of a vending stand in order to encompass snack bars and similar merchandising operations; and (c) so that provision be made within the appropriate Federal agency for appeals from departmental decisions contra-

dictory to the purposes and intent of the law.

Unmet need No. 7. Condition of unemployable blind persons.—Since the social and economic handicap of blindness is very frequently increased by factors of advanced age, poor health, secondary disabilities, and work background and aptitudes which cannot effectively be used without sight, many blind persons are unemployable, and about two-thirds of these unemployable blind persons find that living with public assistance cannot be avoided. In view of this, the subsistence provided by public assistance is inadequate to support wholesome morale in these blind recipients and, consequently, results in unhappiness for the recipients and deterioration of the social setting in which they live.

Under the present law, welfare agencies, as well as friends and relatives who have no legal responsibility for these blind persons but who may be interested in ameliorating their condition are prevented from offering any regular financial assistance by the fact that any such assistance is nullified by an offsetting

reduction in the public assistance grant.

Not only is there need for additional supplementation without the application of current offsetting provisions; but many blind persons could be given an important sense of belonging, and of being useful, if they were encouraged to undertake part-time remunerative employment.

Proposed solution: Title X of the Social Security Act should be amended to mandate the exclusion of an aggregate \$1,200 net income per year from any source—not restricted to earned income—in computing the resources of blind

recipients of public assistance.

Unmet need No. 8. Condition of blind persons who possess a limited or full potential for employment.—Blind recipients of public assistance who are capable of partial or full self-support are denied an adequate incentive to help themselves, as no portion of their earnings, beyond the meager limit of \$50 per month, can be used to improve their severely depressed standard of living under the present law. They are denied the values accrued from work, as the satisfaction that work can afford lies largely in the tangible rewards of work. This condition tends to perpetuate the frustration of being unable to rise above a subsistence level of living. It produces a defeatism and loss of dignity for the blind persons involved, which diminishes their abilities to contribute to the economic and social health of the communities in which they live.

Those blind persons who have been self-supporting prior to having to resort to public assistance and who have some potential for regaining self-support find that the rewards of their thrift and hard work are nullified by the requirement that they exhaust or assign virtually all of their real estate holdings and their life insurance. This requirement tends to delay the acceptance of public assistance by impoverished blind persons, who undermine their own health and cause the deterioration of the social climate of the communities in which they live by their reluctance to accept public assistance under these circumstances. Along with the prohibition against saving by recipients of public assistance, it also imposes insurmountable barriers to the reestablishment of self-support.

Proposed solution: Title X of the Social Security Act should be amended to

mandate that:

(a) The first \$1,200 per year of income from whatever sources be exempted in determining available resources plus one-half of all earned income in excess of \$1,200 until complete self-support has been attained;

(b) The cash surrender value of policy or policies of life insurance shall be disregarded in computing resources up to a cash surrender value of \$5,000, face

value, of life insurance;

(c) The value of property used as a home shall be disregarded;

(d) Any additional resources in the form of real and/or personal property or income which are necessary to implement an approved plan for achieving

self-support may be retained;

(e) For the purpose of encouraging and enabling a greater number of recipients of aid to the blind to become self-supporting, all expenditures incurred by a recipient in effecting his plan to become self-supporting, including payments made for the purchase of fixtures and material needed by him in effecting such plan, shall be deducted from gross income in computing net income, provided that such payments shall not be more than \$100 per month.

Unmet need No. 9. Inadequate appreciation of the needs and potentialities of blind recipients of public assistance.—Administrators of public assistance who are unable to devote an adequate portion of their time for studying the special needs and potentialities of blind persons fail to appreciate the difference between the unique conditions which affect blind recipients and those which prevail for

18511

recipients of public assistance who are not blind and which form the basis upon which public assistance programs are developed and administered. This situation has resulted, generally, in the evaluation, on both the Federal and State levels, of public assistance administered to the blind by standard criteria applicable to other large categories and, inevitably, such an evaluation has failed to reveal the true condition of blind recipients of public assistance or to suggest the measures that are so desperately needed to alleviate their condition.

If this situation is to be remedied, there must be a differentiation of public assistance for the blind from other categories for the following purposes:

1. It is the only effective way of not having aid to the blind hopelessly scrambled with other programs which, through the sheer weight of numbers and controversy, pretty completely snuff out the different objectives needed in aid to the blind.

2. It places above ease of administration the needs of blind persons as the

more important objective.

3. It provides for an administration which continuously recognizes and makes provision for the special needs and requirements of aid to the blind recipients.
4. It promotes a greater understanding on the part of those actually admin.

4. It promotes a greater understanding on the part of those actuary administering aid to the blind of the many problems peculiar to blindness, thus as-

suring a more effective and efficient administration.

5. It alone makes possible the full utilization of present available resources and the development of new resources which contribute to the attainment of self-care or self-support by blind recipients, thus providing a more economical administration.

6. It makes possible the formulation of separate rules and regulations which relate directly to the needs of blind persons, thus providing a framework of administration which is geared to the problems incident to blindness and to the objectives to be sought.

7. It provides direct and constant access to top management with respect

to the needs of the program.

Proposed solution:

(a) That each State agency administering or supervising the administration of aid to the blind should create a bureau or division for the blind devoted to carrying out the administration or supervision of administration of aid to the blind. This is, in our view, the only truly effective means of assuring a reasonably adequate solution to the problem as stated;

(b) That title X of the Social Security Act should be amended to provide at least one full-time consultant on services to the blind in the public assistance

office of the U.S. Department of Health, Education, and Welfare;

(c) That the Bureau of Public Assistance should regularly collect and publish

detailed statistics on recipients of aid to the blind.

Unmet need No. 10. Need for increased Federal participation in public assistance for the blind.—The increased costs that will be entailed in improving public assistance for the blind cannot be absorbed by the States. Approximately 40 percent of the recipients of aid to the aged also receive benefits under title II of the Social Security Act, while only about 12 percent of the recipients of aid to the blind receive benefits under title II. With respect to aid to the blind, the current \$65 per month ceiling on Federal participation unduly depresses the standard of living of blind recipients. The long-range economic saving as well as the gains in human and social values can be achieved only by substantially increasing the ceiling on Federal participation.

Proposed solution: Title X of the Social Security Act should be amended to provide a revised formula which will increase the ceiling on Federal financial participation from \$65 per month to \$100 per month based, as now, on the average paid to all recipients within the category in the form of money payments

and medical services.

Unmet need No. 11. Economic disadvantage of employed blind persons.—The necessity of selecting a place of residence convenient to public transportation, the necessity of patronizing those stores which provide maximum assistance in purchasing, the necessity of employing painting and other property maintenance services, the necessity for blind persons in the professions to secure reader services and a great many other conditions serve to impose an extraordinary burden of major consequence upon the financial resources of blind persons. This means that any blind person requires a significantly greater financial resource than his seeing peer to maintain a given standard of living. In addition, with very few

exceptions, a blind person's earning power is substantially lower than it would be if he could see or than it was before he became blind. Aside, therefore, from the relatively few fortunate blind persons who are able to earn a substantial income, any blind person in our society suffers a major economic disadvantage which tends to deny a basic sense of security. For these reasons and because the disability provisions of the old-age and survivors' insurance section of the Social Security Act have related benefits to compulsory acceptance of rehabilitation, to substantial gainful employment, to arbitrary age 50, and to a minimum definition of blindness, amendments are needed to resolve this sense of insecurity, to clarify the eligibility requirements under the act, and to make it truly a program of social insurance protection against disability.

Proposed solution: Title II of the Social Security Act should be amended to

provide:

(a) Benefits as an absolute right regardless of age, income, or employment status, related exclusively to the establishment of the disability of blindness within the following definition: "Central visual acuity of 20/200 or less in the better eye with correcting lenses, or visual acuity greater than 20/200 if accompanied by a limitation in the fields of vision such that the widest diameter of the visual field subtends an angle no greater than twenty degrees."

(b) That the minimum requirement of coverage of 20 quarters of the last 40

quarters be reduced to no more than 6 quarters of coverage;

(c) That the present provision of compulsory acceptance of rehabilitation be abandoned, but that instead the Bureau of old-age and survivors' insurance be

encouraged to suggest rehabilitation to all beneficiaries.

Unmet need No. 12. Blind persons who earned coverage after onset of blindness.—As a matter of equity, blind persons who have been employed in covered industry during the course of their blindness should certainly have available to them those earned benefits which are provided for all others suffering from the identical disability. The number of such persons will be relatively small since blindness occurs in the vast majority of cases around or after the normal age of retirement, and also because probably not more than 5 percent of blind persons are in covered industry. Such a provision would assure the blind person and his family a degree of basic financial security, and would effect a corresponding reduction in the expenditure of public assistance funds.

Proposed solution: Title II of the Social Security Act should be amended to make disability insurance benefits available to persons who have earned cov-

erage since the onset of the disability of blindness.

Unmet need No. 13. Need for amendment of Public Law 565 to include so-called independent living provisions.—There was considerable and lengthy discussion with respect to independent living legislation. By this type of bill the group meant expansion of Public Law 565 to—

 Make eligible for rehabilitation services severely handicapped individuals for whom vocational rehabilitation services may not be feasible but who, as a result of rehabilitation services, can achieve such ability of independent living as to dispense with the need for expensive institutional care or the need of an attendant at home.

2. Enable the Federal Government to assist in the establishment of nonprofit

workshops and rehabilitation facilities.

Provide Federal assistance to the States to enable them to operate comprehensive evaluation programs for individuals who may benefit from rehabilitation services.

Proposed solution: The group wished to record itself as being in favor of the independent living type of legislation and the philosophy behind it. The group commended the idea of extension of services to more clients but expressed the strong hope that such an extension of services will not destroy nor materially interfere with the present vocational rehabilitation programs.

(This was the only proposed solution that did not receive a unanimous vote.

Motion carried with considerable majority.)

Unmet need No. 14. Revision of Public Law 565 concerning the provision of reader service to blind persons in training.—The group expressed itself as dissatisfied with the provisions of Public Law 565 which placed reader service under a determination of economic need. Under its predecessor, Public Law 113, provision of reader service was interpreted as a training service and not subject to economic need.

Proposed solution: Public Law 565 and its attendant regulations should be amended so that the provision of reader service to blind clients in training would not come under a determination of financial need.

Unmet need No. 15. Better exchange of information among vocational rehabilitation personnel.—The group felt that vocational rehabilitation as a whole would benefit a great deal from regular meetings on a regional basis of Federal and State rehabilitation staffs to exchange information and ideas with respect to the program. Likewise, courses should be conducted for specialized State persons, such as vending stand operators and small business enterprise program counselors—somewhat similar to the current program conducted at Southern Illinois University for placement counselors of the blind.

Proposed solution:

(a) Recommend that the Office of Vocational Rehabilitation sponsor biennial meetings on a regional basis of State blind agency vocational rehabilitation supervisors, placement counselors, vending stand and business enterprise counselors in conjunction with the regional staff of the Office of Vocational Rehabilitation, as well as the necessary specialists in the Division of Services of the Blind and other sections in the Washington office of the Office of Vocational Rehabilitation. Such meetings should be sponsored by the Office of Vocational Rehabilitation on a grant basis or on a contract basis to allow all such State personnel to attend and to overcome the very real difficulty that States have in obtaining approval for out of State travel on limited travel budgets.

(b) Recommend that the Office of Vocational Rehabilitation take necessary steps to establish suitable courses for vending stand and business enterprise

counselors of the blind.

MINORITY REPORT

By Dean P. Morrison

It is proposed that Public Law 565 should be amended to permit State rehabilitation agencies providing services for the blind to purchase any or all services on a per case basis from other agencies which operate programs or qualified individuals, that meet standards established by the State agencies.

The above was voted upon by the group—but was defeated.

ATTENDANCE SHEET

Baker, Frank, president, Maine Council of the Blind.

Beckley, Ralph W., assistant regional representative, office of vocational rehabilitation.

Bilodeau, Kenneth L., Massachusetts Department of Mental Health.

Carter, Mrs. Bertha, director of education of physically handicapped children, State department of education.

Cole, Virginia, director, division of the blind.

REPORT OF WORKSHOP ON SPECIAL EDUCATION OF THE BLIND

Cochairmen: Mr. Frederick D. Greehan, Dr. Edward J. Waterhouse.

INTRODUCTION

Since there is no workshop dealing with partially seeing children, it was agreed that this workshop should have these children in mind in their deliberations. It was understood in these discussions that no distinction was being made between children educated under various systems, e.g., the residential school and public school programs for the blind, et cetera. They all need the best services obtainable.

The workshop made no attempt to analyze all the problems which face educators of blind youth, but endeavored to concentrate on areas where Federal assistance might most appropriately be sought. It recognized that in the United States the prime responsibility for solving problems resides in each State. Specifically, the workshop refrained from making proposals whose sole aim was the transfer of costs from the States to the Federal Government.

The Congress of the United States has, however, accepted responsibility in certain areas of the education of the blind and other handicapped groups. The workshop confined itself mainly to considering proposals for the expansion or improvement of services in these areas.

In the expectation that such a course would make easier the task of the congressional subcommittee, the workshop is issuing its report in a form suggested by the Workshop on Special Education of the Blind held in New York City in October 1959.

The workshop noted with satisfaction the cooperation and support currently being given by the Department of Health, Education, and Welfare to the American Foundation for the Blind and the American Association of Instructors for the Blind in programs for training mobility instructors and teachers of industrial arts. It noted also the greatly increased services of the American Printing House, made possible in the last few years by increased Federal appropriations, and amended legislation. Finally, it noted the recent change in legislation permitting the Library of Congress to include children's books in its services to bilind readers.

PROBLEM I-TEACHER SHORTAGE

The shortage of qualified teachers is not confined to the education of handicapped children, but its effects are perhaps more serious in this area than in general. Facilities for training teachers of blind children are inadequate in most regions and entirely lacking in some. However, the shortage of candidates for some of the existing training facilities suggests that the problem is a complex one and that the addition of new facilities alone will not solve it. In many localities, teachers with no special training are made responsible for educating blind youth. Perhaps the need for establishing acceptable teacher and teaching qualifications for specific jobs is just as great as the need for facilities. With these thoughts in mind, the workshop submits the following proposals.

Proposal 1A

In addition to the consultant recently appointed, a highly qualified staff on the education of blind children (including partially seeing children) should be added to the Department of Health, Education, and Welfare in the Office of Education, Section for Exceptional Children and Youth. Included in the responsibilities of this staff would be a nationwide study of educational services offered blind children with particular reference to the problems of training teachers adequately to teach the blind, and the duty of recommending desirable teaching standards to State departments of special education and other agencies interested in and/or responsible for the education of blind children.

Proposal 1B

Public Law 85–926 deals with the "expansion of teaching in the education of mentally retarded children through grants to institutions of higher learning and to State educational agencies." It is proposed that this law be expanded to provide similar services for teachers of blind children, or as an alternative, new legislation be submitted to accomplish the same end. It is suggested that stipends for such purposes include readers' fees for blind fellowship recipients when the fellow requires such services. Such awards may be given at approved training centers or possibly through travel or through intensive workshops as well as study at colleges and universities.

PROBLEM II-SHORTAGE OF NONTEACHING PROFESSIONAL PERSONNEL

This group includes such skilled workers as psychologists, social workers, educational counselors, speech therapists, and others who work on a professional level with blind children.

The workshop recognized the importance of the services such persons can render to blind children and to their families. It recognized that a shortage exists of trained personnel with a special understanding of the problems caused

by blindness in childhood and in youth.

The workshop felt that Federal aid in establishing special training facilities would be helpful, but recognized that this would only be a partial solution to the problem. In some regions throughout the country the services of these professional people are made available in ample measure, whereas in other regions, administrators of programs for blind children seem to be disinterested in providing these valuable services to blind children in their care. Other administrators, while interested, seem to lack the financial resources to employ these workers.

The vast range in variety and quality of services being offered from State to State and from locality to locality is a matter of considerable concern to the workshop, but they did not feel the reasons for this were entirely clear.

Proposal 2A

It was recommended that the staff suggested in proposal 1A investigate the reasons why the services of nonteaching professional personnel are not more widely employed on behalf of blind children and their parents. If their report indicates the desirability of such action, legislation should be prepared to provide grants in aid to the States for the setting up or expansion of such services. As in proposal 1B, awards may be given at approved training centers or possibly through travel or through intensive workshops as well as study at colleges and universities.

Proposal 2B

It was recommended that the Department of Health, Education, and Welfare be authorized to participate with public and private national and local agencies in setting up national and regional workshops and/or training seminars to encourage the increased use of these nonteaching professional services.

PROBLEM III-SHORTAGE OF BOOKS AND OTHER EDUCATIONAL MATERIAL

The workshop recognized that the existing shortage of books in public school classes is mainly due to the difficulty of supplying one or several copies of the text at short notice. It noted that in the residential schools where textbooks can usually be chosen in advance from available braille or large-type titles, a less serious problem exists than in the regular schools. The workshop recognized that considerable study of this problem has already taken place and is continuing. It recognized the value of the new plastic-forming reproduction technique perfected by the American Printing House which permits copies of hand-transcribed material to be reproduced expeditiously. It recognized also the great contribution being made by many volunteer groups of transcribers and readers. It noted in particular the tendency among these groups to pool their problems and cooperate with each other.

The workshop does not believe that an adequate supply of braille or recorded materials can be supplied to the pupils in their regular schools without the continued support—perhaps even on a greater scale than at present—by these volunteers. Historically, even the best-equipped residential schools have de-

pended in some measure on volunteer transcribers and readers.

The workshop recognized that legislation which will be submitted to Congress in 1960 will permit the American Printing House to meet more effectively some of the urgent needs of blind children. It is hoped that this legislation will meet with the approval of the House Committee on Education and Labor and of the Congress as a whole. Nevertheless, in case this approval is not obtained, proposal 3A, which follows, is submitted. Proposal 3B and 3C are not in any way associated with this pending legislation.

Proposal 3A

The Act to Promote the Education of the Blind, under which the American Printing House for the Blind of Louisville, Ky., supplies books and material to the schools, be amended to permit Federal funds to be used for the expenses of specialists or consultants to work both at Louisville and in the field on such technical problems as title selection, anticipation of needs, improved methods of production, problems of distribution, educational research, and cooperation with volunteer transcribers. The present authorization of \$400,000 annually should be increased to whatever sum is needed. The workshop draws particular attention to needs of partially seeing children for more large-type books.

Proposal 3B

That the American Printing House be granted funds to supply braille paper gratis and braille writers on loan to volunteer transcribers duly certificated by the Library of Congress. Transcribers accepting such services would be required to sign an agreement to braille an agreed minimum amount of material annually, and to return the braille writer to the American Printing House for the Blind when no longer used.

Proposal 3C

If necessary, the Library of Congress should be authorized to expand its program of training transcribers and certifying proofreaders. The workshop is not in favor of reimbursing the services of hand transcribers, proofreaders, or recorders from Federal funds. (This does not apply to the current program of the Library of Congress.)

PROBLEM IV-STUDY-DEVELOPMENT OF THE BLIND CHILD

PROBLEM V-STUDY PROBLEMS OF THE BLIND CHILD WITH ADDITIONAL HANDICAPS

The workshop found itself in substantial agreement with the points of view of the New York Workshop on these two problems and endorsed the recommendations contained therein.

PROBLEM VI-FEDERAL AID FOR EDUCATION OF BLIND CHILDREN

The workshop recognizes that the additional cost of special education is considerable and would urge a further study of this matter by the Department of Health, Education, and Welfare. Proposals for Federal aid in certain areas are included under specific problem headings.

PROBLEM VII-USE OF AVAILABLE FEDERAL FUNDS

There is evidence that available funds for grants and aids for research have not been applied effectively to the educational problems of blind children.

Proposal 7A

The Department of Health, Education, and Welfare is requested to study this matter with a view to a more effective use of its resources.

PROBLEM VIII-FINANCIAL RELIEF FOR PARENTS OF BLIND CHILDREN

Proposal 8A

The workshop concurs with the proposal made in New York amending the Internal Revenue Code to allow an additional exemption for dependent blind persons.

CONCLUSION

The workshop would like to place on record its appreciation of the interest of the Subcommittee on Special Education of the House Committee on Education and Labor in the problems of the education and rehabilitation of blind children.

Worden, Helen W., director, Rhode Island Association for the Blind.

Mr. Elliott. Next, we will hear from the workshop group on the special medical problems.

STATEMENT OF MRS. KATHRINE HOWE, ON BEHALF OF WORKSHOP COMMISSION ON SPECIAL MEDICAL PROBLEMS

Mrs. Howe. Mr. Chairman, my name is Kathrine Howe. I am in this field, you might say, a nonprofessional, being president of the board of directors of the New Haven area rehabilitation center.

Mr. Elliott. Mrs. Howe, will you speak just a little louder, please? Mrs. Howe. Yes, sir. Our workshop group consisted of 36, this being the total number in attendance. I might say there were comings and goings. At no time probably were there 36 present.

However, the recommendations here should be considered a consensus of those present at the time these particular subjects were being discussed. Ours I do have in final written form. I will hit some of the highlights of that report. The considerations and recommendations are considerably jumbled together, but I think it should be clear

upon reading.

We first established for ourselves a working definition realizing that better qualified groups than ours had defined chronic illness which basically was our concern, special medical problems, but we did come up with a definition which we felt was understood by all of us as covering more or less generally the field.

One of the things we discussed was the fact we felt that perhaps there was the need for additional professional personnel in the regional offices of vocational rehabilitation in order to increase the

effectiveness of these offices.

For instance, all of the regional offices do not have full-time physicians. We feel that a physician is essential on the rehabilitation team,

vocational or otherwise.

An advisory committee to this office might plan and coordinate the services it sponsors and recommend developments, should review and approve all research and demonstration projects and study ways of improving the community and cooperation of those providing rehabilitation services.

I might say that these words, community and cooperation, recurred frequently during the course of our 2-day discussion, in many instances in such a way that certainly the legislation would not solve the problem, but we were more than conscious of the fact that there are breakdowns in the kind of cooperation and exchange of information between agencies, official and voluntary.

We cannot legislate to overcome this, but we should certainly all

be thinking about it.

We feel that the provision of funds to publish the findings of research and demonstration projects is essential. There are instances where research projects are being done through private funds, from foundation and whatnot, and that these same kinds of projects have been repeated by someone else, someplace else, not knowing that the first one has been done.

We may be all guilty of this, but if there could be broader distribution of the findings of research projects we might eliminate

duplication and help each other more.

We spent a good deal of time on the importance of research, many aspects of it, one of them the causes of chronic illness, finding causes of illness, opening avenues in preventing illness, and finding cures, also in the basic sciences, physics, chemistry, and so on.

The applied plans such as engineering have much to offer in the

upgrading of rehabilitation services.

Many people with special medical problems have inadequate housing, nutrition, and medical supervision with expensive drugs being difficult for them to purchase. We felt that Federal grants to study these problems and to find ways of alleviating them should be made available to experts in these fields interested in doing research.

Although some States, notably Connecticut, in our discussion yesterday, seemed to have enough facilities—I emphasize the theme there was not complete agreement—the fact that there are some empty beds did not seem to me and to a couple of others, to indicate this means that we have facilities that we don't need. I think it is rather an

indication that there may be the need, but perhaps the people, the physicians, have not been educated to the fact that these facilities are available.

I think we could find the people to fill them.

Anyway, some States seemed to have enough facilities to provide comprehensive rehabilitation services, but the New England region as a whole did not. We felt that States without adequate facilities might perhaps make use of those operated by neighboring States and that there should be some way provided for the States to pay for the care for their beneficiaries in another State.

If this is one our our northern New England States where perhaps there are not enough patients to fill a large new institution, that there might be some arrangement whereby that State fund might pay for

their beneficiaries in another State.

We do not know enough about the cost of providing rehabilitation services. We felt that a consistent, sound, cost-accounting basis might be explored such as has been established by the Connecticut Hospital Association in this State.

All of the hospitals in Connecticut work on these same cost-

accounting bases.

We feel that they have realistic figures available to know exactly what services cost how much and we would suggest that some exploration be done in the rehabilitation line that we might come up with the same kind of figures.

Handicapped people primarily deal with the long-term things, cerebral palsy, mental retardation, who are housed with their families in their homes, sometimes find their families unable to take care of

them.

For instance, because of the temporary illness of one of the parents or even as the cerebral palsy individual, or one with mental retardation becomes older and the parents die, there needs to be some way to take care of these kinds of people on a temporary basis if it is a temporary disruption of the home or on a more permanent basis, where necessary.

We felt that the facilities of the program to foster home care might be developed to provide this kind of service. There are sufficient number of cases to warrant a federally sponsored study of the

problem.

We would hope that such a study might produce suitable legislation. The subject of personnel was another one that got a great deal of discussion time. With the increasing problem we feel they cannot be resolved without an increased number of personnel in the various disciplines involved in the rehabilitation team. We feel that Federal grants to universities and other training facilities to enlarge their faculties by addition of specialists in this field are strongly recommended, that scholarships should continue and that there should be more of them for worthy students interested in the field.

Assistance might also be given to rehabilitation facilities that are willing and able to give their clinical training to these people that Federal grant to such agencies might serve as an incentive to them.

We also felt that more emphasis might be given to the nonprofessional personnel similar to the nurses aid programs that the nurses have done so well with.

We felt it was desirable to have these aids as soon as possible. And that a study should be made to delineate the areas of responsibility for professions in this field, meaning by this that there should be a distinct delineation of work that might be done by the professionals such as the occupational therapist or the physical therapist but an aid could assist her in a less professional activity, but there should be a clear distinction as to who may do what.

On the subject of the insurance, the insurance carriers do not pay for vocational training; therefore, we felt there might be a better liaison in cooperation by physicians, insurance carriers, and vocational

rehabilitation personnel.

On the disabled who are applying for total and permanent disability, most of these seemed to be very poor candidates for rehabilitation as far as the goal for reemployment is concerned.

However, we learned from experience that some of them so upgrade

their abilities that the goal becomes more practical.

In addition, may disabled could live with less dependency if reha-

bilitation services were paid for.

In addition to humanitarian values, such provisions would save money because fewer custodial personnel would be needed.

More of these handicapped people would be able to live with dignity

among friend and family if such services were provided.

We felt that a criteria such as the feasibility of employment might well be eliminated in determining eligibility for Federal and State rehabilitation services.

Rehabilitation of the disabled by rehabilitation teams often points to unexplored yet highly productive avenues for the handicapped individual. These are expensive services with a number of skilled personnel necessary to undertake them.

Therefore, we feel that grants to stimulate this service are de-

sirable.

The last point which we make is that assistance to evaluate rehabilitation potentials would be welcomed by a majority of the convalescent hospitals in Connecticut. We need two or three representatives from our convalescent hospitals or nursing homes and they are extremely interested in the problems of rehabilitation.

There was general agreement that it is more economical to provide funds for rehabilitation than it is to maintain the disabled individual.

There was considerable discussion of the current formula for making grants to States for vocational rehabilitation, currently on a closed

It was recommended that such funds be made available to States on an open-end basis, as they are for public assistance programs.

Mr. Elliott. Thank you very much, Mrs. Howe, for that very fine report.

WORKSHOP REPORT ON SPECIAL MEDICAL PROBLEMS

(Dr. Sterling B. Brinkley and Robert J. Van Wart, cochairmen)

INTRODUCTION

Thirty-six experts in medical affairs from the New England region participated in one of seven sections of a special education and rehabilitation study sponsored by the Subcommittee on Special Education of the Committee on Education and Labor of the U.S. House of Representatives.

This study was conducted at Yale University on December 15 and 16. The section was asked to consider the needs of the citizens in this region who are handicapped by special medical problems; to review how these individuals are currently assisted by federally sponsored health and welfare programs; and to consider how they could be even more effectively assisted by additional federally sponsored programs.

The participants have experience and training in many of the disciplines concerned with rehabilitation. Unfortunately all of them could not attend all of the sessions. Therefore, the following recommendations are the consensus of

those present when the problem referred to was being discussed.

Considerations and recommendations (a summary)

1. Special medical problems were defined as the problems of people who are disabled physically and/or mentally for a prolonged period; people who need comprehensive coordinated services and/or facilities to restore their abilities so

that they may live with dignity and self respect.

2. The regional office of vocational rehabilitation needs additional professional personnel to increase its effectiveness (a full-time physician, for example). An advisory committee to this office should plan and coordinate the services it sponsors and recommend developments. It should review and approve all research and demonstration projects and study ways of improving the communication and cooperation of those providing rehabilitation services.

3. The provision of funds to publish the findings of research and demonstra-

tion projects was suggested.

4. Research: Of primary importance is research into the cause of chronic illness. Epidemiological research, together with finding the cause of illness opens avenues to preventing illness and to finding cures. Also, basic sciences (physics, chemistry, math) and applied science such as engineering have much to offer in the upgrading of rehabilitation services.

5. People disabled by one disorder are, of course, doubly handicapped if complications relating to their primary handicap develop. Many of these complications could be prevented if health services applied what is now known. Programs to this end are essential. All measures to protect the handicapped individual avoid additional unrelated handicaps should also be encouraged.

6. Many people with special medical problems have inadequate housing, nutrition, and medical supervision. Drugs may be too expensive for them to purchase. Federal grants to study these problems and find ways of alleviating

them should be made available to interested experts in these fields.

7. Although some States, notably Connecticut, seem to have enough facilities to provide comprehensive rehabilitation services, the New England region as a whole does not. States without adequate facilities should make use of those operated by neighboring States and pay for care provided their beneficiaries.

8. Costs of providing rehabilitation services are not generally known. Sound, consistent cost accounting such as that now used by all of Connecticut's general hosnitals is essential if States are to relate realistically the cost of service to

the results obtained.

9. Handicapped people, notably those with cerebral palsy and mental retardation, who receive housing and custodial care by their families in their homes

may find their families unable to continue caring for them.

Facilities or programs of foster home care should be developed to provide this service. There is a substantial number of such cases, therefore a federally sponsored study of this problem is warranted. Such a study should bring forth

suitable legislation.

10. The increasing problems of rehabilitation cannot be solved until a large number of trained personnel becomes available. Therefore, Federal grants to universities and other training facilities to enlarge their faculties by the addition of specialists in this field are strongly recommended. Scholarships for worthy students interested in this field are also desired. Assistance should also be given to rehabilitation facilities willing and able to give clinical training to these people. Such Federal grants may serve as an incentive. Many types of rehabilitation services can be provided by people who have not received extensive formal training. It is desirable to have aids assume as many responsibilities as possible and a study should be made to delineate areas of responsibility for professions in this field.

11. Insurance carriers do not pay for vocational training. Therefore, ways of establishing better liaison and cooperation by physicians, insurance carriers,

and vocational rehabilitation personnel should be encouraged.

12. Of the disabled applying for assistance because of total and permanent disability, few seem to be good candidates for rehabilitation with the goal of employment or reemployment. However, some of these people are found to so upgrade their abilities that such a goal becomes practical. In addition, many of the disabled could live with less dependents if rehabilitation services were available and paid for. In addition to considerable humanitarian values, such provisions would save money because fewer custodial care personnel would be needed by these people. More of these handicapped people would be able to live with dignity among friends and family if such services were provided.

Criteria such as feasibility of employment should be eliminated in determining

eligibility for Federal-State rehabilitation services.

Reevaluation of the disabled by rehabilitation team often points to unexplored yet highly productive avenues for the handicapped individual. Reevaluation services are expensive because a number of skilled professional personnel provide such a service. Therefore, grants to stimulate this service are desired.

13. Assistance to reevaluate rehabilitation potentials would be welcome by a

majority of convalescent hospitals in Connecticut. Ways and means of developing this service should be explored.

14. Policies sold by commercial insurance companies are dramatically increasing the numbers of people protected from financial catastrophe. Blue Cross also is studying how they too can pay for prolonged illness while maintaining their solvency.

Participants in order of attendance:

Name and affiliation:

Alice Marshall, Connecticut State Employment Service, New Haven.

William Woods, Meriden Rehabilitation Center, Connecticut.

Ruth Curtis, united community services, Boston.

A. Ryrie Koch, office of vocational rehabilitation, Northeast Region, Boston.

Mary Brown, Yale University Department of Public Health.

Vera Arterburn, Connecticut Chronic and Convalescent Hospital, association secretary. Theodore Hawkins, Connecticut Chronic and Convalescent Hospital Asso-

ciation. Sterling Brinkley, Gaylord Farm Sanatorium, Wallingford, Conn. Robert VanWart, Bay State Rehabilitation Center, Springfield, Mass.

I. W. Scherer, Veterans' Administration, Northampton, Mass.

Michael Marcinkowski, Veterans TB and Health Association.

Stuart Knox, Connecticut Hospital Association.

Edith Olson, Yale University School of Public Health.

Elizabeth May, dean, School of Home Economics, University of Connecticut. Anthony Suchy, Connecticut Blue Cross,

Philip Schneiderman, United Cerebral Palsy of Western Massachusetts.

Kathleen Howe, New Haven Area Rehabilitation Center.

Horace Brown, Connecticut Heart Association.

D. Guiliano, Consultants, Inc.

M. Pringle, Colonial Convalescent Hospital.

Bess Lande, public health student, Yale.

G. H. Riopel, bureau vocational rehabilitation, Hartford, Conn.

Helen T. Watson, Connecticut State Department of Education, Hartford, Conn.

Pauline McCready, Crotched Mountain Rehabilitation Center, New Hampshire.

John Allen, M.D., Newington Hospital for Crippled Children, Connecticut.

J. Meigs, M.D., Yale University Department of Public Health. John Gallivan, M.D., United Aircraft, East Hartford, Conn.

James Miller, State health department and medical society, Hartford, Conn. H. Stoppels, Aetna Life Insurance Co., Hartford.

Samuel Deich, Colonial Convalescent Hospital, Glastonbury, Conn.

H. Barrett, State department of health, Connecticut.

M. Horton, executive director, Connecticut Medical Service.

H. Biechan, Connecticut Medical Services, New Haven.

Ray Grey, community council, Bridgeport, Conn.

J. Peters, State bureau of vocational rehabilitation, Connecticut. Ira Hiscock, Yale University, Department of Public Health, Hartford. May I thank you, Dr. Gall, for a very successful workshop. Our next witness is Miss Ethel D. Mecum, superintendent, Long Lane School, Middletown, Conn.

STATEMENT OF ETHEL D. MECUM, SUPERINTENDENT, LONG LANE SCHOOL. MIDDLETOWN, CONN.

Miss Mecum. I would like to speak, if I may, for Royce Rocklin, who represents the training school for boys and who is president of the men's superintendent conference, and who said that Mr. J. B. Hill, of Alabama, had been appointed by the men's conference to represent all of these boys' training schools.

I am president of the National Association of Training Schools and

iunior agencies

I think perhaps what I say in this statement may apply to the field

nationwide.

The State training schools have one of the most difficult, as well as most challenging, of all types of work with children. Unlike private agencies and institutions, we must accept every child committed by the juvenile court, whether or not we have room or are equipped programwise to meet the child's particular needs. The school becomes a sort of catchall, with a wide range of age, intelligence, ability, and types of problem.

Often the training school fails to receive the understanding, sympathy, and support of the public which is given agencies working with nondelinquent children—retarded, blind, crippled, et cetera—as the public demands that delinquent behavior be curbed and controlled

without looking behind the overt behavior for its causes.

We know that delinquent behavior grows out of a variety of unmet needs of the child. The delinquent is usually an unhappy child, often rejected by family and community, usually a problem in school, usually with very low self-esteem.

The institution is charged with providing a setting combining controls, protection, training, and education—round-the-clock living.

The school must provide satisfying relationships and experiences and help the child to develop inner controls and the ability to again

live in a community situation in a socially acceptable fashion.

Our children for the most part come from the lower economic and social group and are woefully lacking in general information as well as socially deprived. They have moved from school to school, and have been lost educationally, developed dislike of school probably because of lack of success and satisfaction, truanted, and because of noncomformity in the classroom have been endured by the teachers or suspended.

The program must be flexible and offer a large variety of educational opportunities, and the teachers must be better than the best, if these public school misfits are to find a security and develop self-confidence. Teachers must understand children as well as subject matter.

It is our feeling that children should not be penalized educationally because of prior behavior difficulties: that they have a right to a new

chance.

Our elementary teacher with 21 children working at different levels from grades 5 through 7, received into her class the other day a

15-year-old, 6 months pregnant, described in her social history as a psychiatric problem from age 5, angry, moody, aggressive, unable to get along with her peers, had spent 2 years in a private child-caring institution, rejected by an immoral mother, has made more than one suicidal attempt, was sent home from a maternity home because of failure to adjust, refusal to eat, and threatened suicide.

This child wrote the following letter to her teacher at the end of the

first day in our school:

The first room I went to was the library. Then the principal came and showed me to your classroom. The first things I seen was the Christmas things on the windows and the boards. It was a happy thing. That was when I knew that school would be pleasant this year for me.

This is an unattractive, unwanted child, who had been expelled from each school she had attended. Her new teacher is challenged to help her succeed in life as well as in the classroom.

Another child writes the same teacher:

Thank you for helping me in school and showing me how to be a good girl. Thank you for showing me the wrong things and the right things. I thank you so much for wasting your time to help me to learn.

This from an aggressive youngster who had terrorized the children in the school and neighborhood from which she came.

These cases are not isolated ones, by any means.

To better meet the tremendous needs of these youngsters we need:

1. Expansion of program to give greater variety—a modified shop setup and additional opportunities for the theory of homemaking. Practical courses are offered in cottage life program.

2. Reading specialists on high school level to work with the 40 percent who have reading problems which are causing failures in other

learning areas.

3. Remedial and developmental teachers to plug the holes in basic learning and to offer special help to the small percentage of very bright students.

4. Summer school for students to be given the opportunity to make up deficiencies in order to have sufficient credits to be up to grade

when they return to public school.

Full-time psychologist.

6. Dramatics, dancing, swimming instruction. These areas are no longer felt to be luxuries, but necessary therapeutic agents.

7. Funds for substitute teachers when regular teachers are ill.

8. Greater understanding and acceptance of students when they return to public school.

9. Funds for boarding-home care for those girls who are not

capable of earning board and room while attending school.

It is understood Federal funds have been made available in some States for pilot projects such as the above. We seem unable to

stretch our budget to meet the above educational needs.

I would like to ask if funds are made possible that in some way the delinquent children are not left out in this State at least. The child welfare funds all go to the commissioner of welfare. Somehow they never seem to reach the delinquent child, although they may have been under care of the commissioner of welfare. They do not reach out after the child has become labeled delinquent and comes to us.

Thank you very much.

Mr. Elliott. Thank you very much, Miss Mecum. Your statement will be very helpful to the committee.

Miss Mecum. Thank you.

Mr. Elliott. Our next witness is Pauline I. McCready, director, Crotched Mountain Rehabilitation Center, Greenfield, N.H.

STATEMENT OF PAULINE I. McCREADY, DIRECTOR, CROTCHED MOUNTAIN REHABILITATION CENTER, GREENFIELD, N.H.

Miss McCready. Mr. Chairman, members of the subcommittee, I wish to applogize for the fact that the U.S. mail has apparently mislaid our prepared material, and, once it catches up with it, may we have permission to send it to you and have it entered into the record?

Mr. Elliott. Without objection, the prepared statement of Miss McCready will be made a part of the record, immediately following

her oral presentation.

Miss McCready. I have culled out some notes from that material

which I would like to present today.

We are very pleased to have the opportunity to present to you the need for rehabilitation of the physically handicapped as we have found them in our center at the Crotched Mountain Rehabilitation Center, Greenfield, N.H.

Mr. Elliott. Would you tell us about that rehabilitation center,

Miss McCready?

Miss McCready. I will be delighted.

To briefly identify it—because it is rather unique—I might point out that although it is located in New Hampshire, it has become a national institution, or a national organization, I should say.

It is a private, nonprofit organization which offers inpatient re-

habilitation care.

It also cuts across not only State lines but we have children now

from 23 States and 4 foreign countries as inpatients.

It also cuts across every disability which is handicapping, which includes all the neuromuscular, orthopedic, the deaf, the blind, and so forth.

Our adult rehabilitation center, which is to be opened in the next few months, and which has been delayed opening because of the steel strike, is also going to be on a regional or even national basis, rather than a local basis because we have had letters from all of the United States in the past 4 years, from persons and their families and physicians and organizations, asking for it to be opened to provide the comprehensive services which they cannot seem to get any place else.

Now, we call ourselves a comprehensive program, and I think it is. Our staff is composed of physicians, nurses, social workers, physical therapists, occupational therapists, speech therapists, recreation workers in special education, psychologists, and in our school for the deaf course training teachers for teaching in the schools for the deaf.

Every one of our staff is professionally accredited and each one of

our departments is fully accredited professionally.

The adult center is going to include all services which are now being offered in the children's center.

In addition it is going to offer a complete program of vocational counseling and vocational training in a variety of industrial trades,

white-collar jobs, and farming.

Furthermore, we expect, in fact we intend, to take the adult handicapped through to job placement whether it be in their home community which, of course, is what we hope for, but if not, for one reason or another, we will employ them at Crotched Mountain in the various shops which are being established there.

In addition, we are now operating a limited research program within the children's center, and we have a professional training program for which we are accredited in every professional discipline through our affiliation with schools of nursing, colleges, universities, and also we are accredited by an exchange visit or program by the U.S. Department of State.

Mr. Elliott. How many people do you have?

Miss McCready. At the moment we have 85 beds in the children's center, which we badly need to expand. I have been hearing during these workshops for the past 2 days that inpatient centers throughout the country are going with empty beds. This is not our experi-Ours are full, and we have a waiting list. We need to expand.

We are trying to as soon as we can get the funds.

Mr. Elliott. What is your position?

Miss McCready. I am the director, sir. The adult center will start small and grow as we can.

Mr. Elliott. How is your institution supported primarily? Miss McCready. We have endowments. We have a million dollar

endowment for the children's center and \$2 million endowment for the adult center.

We have services throughout the State of New Hampshire.

We also have an annual appeal which we conduct. We have tuition payments from the various school districts, a lot of contributions come in, and then a variety of things of that sort.

So that all together we get it here and there and although once in a while it is a struggle, which is one of the things I would like to point out, the reasons for the struggle and some of the needs that we see.

Mr. Elliott. Of course, I might say if interest rates keep going up

those endowments will help a great deal.

Miss McCready. Of course they will help considerably. When you start working with the handicapped there is no question but what there are unlimited needs.

I don't know who can solve all of them, but in our experience we have picked out four or five major needs which we see which I would like to emphasize today.

The first one is funds for construction of the facilities for comprehensive rehabilitation programs.

In this respect I would like to refer to the proposed plan for area rehabilitation centers because that is precisely one of the reasons why Crotched Mountain was established.

We hoped that at Crotched Mountain we would demonstrate the need for and the value of the comprehensive rehabilitation center and that similar centers or facilities would be established throughout the United States.

It is our feeling that if they were that the need of the physically handicapped would be taken care of to a much greater degree than

they are today.

However, the cost to build a facility of this kind is very expensive. You might be interested to know that at Crotched Mountain we have already raised \$4 million for building costs alone from private sources. We are presently engaged in raising \$1,200,000 for building costs.

Now, we have had to date \$150,000 from the Federal Government to assist in these costs and we have had approved recently an allocation of \$200,000 for this purpose. We have not received it yet.

Our adult center would have been opened long ago if we had had access to Federal funds and had not had to spend so much time traveling the country, getting private sources to gives the funds for this.

We really think that if area rehabilitation facilities are established that Federal funds for the construction are going to be very necessary and one of the most difficult things to get from private sources.

The second need that we see is funds to purchase treatment. Rehabilitation is an expensive proposition as you know. Our costs for-

tunately have been lower than most.

Our present fee in the children's center is \$21.50 a day. You know that is but little more than you pay in the hospital for nothing except your room.

This includes all the services that we offer.

Although the Federal Government matches the State funds, for example, for treatment for the children, many States are not able apparently to provide sufficient funds to take care of the crippled

children within that State that need treatment.

I can tell you that in New Hampshire this year the funds from New . Hampshire which are matched by Federal funds are going to be exhausted on December 31. This means that for New Hampshire children alone we have to scramble around and find approximately \$100,000, possibly more, just to provide rehabilitation for the handicapped children of New Hampshire.

The year before that when they were exhausted it cost us \$71,000,

and the year before that it cost us \$68,000.

We have to get these funds from private sources. Some way we feel that there should be a way, if the States are not able to provide the funds which the Federal Government would match, that there should be some way to get additional Federal funds to take care of these children.

Insofar as the children from other States are concerned, there are very few States in our experience, only one or two at the most, have been willing to pay for services for their children outside the State of residence, and we would like to suggest that some kind of legislation perhaps be afforded to handle this case again with all these youngsters from 23 other States, including one boy, I might add, from your State, Mr. Chairman. We have had to find private funds to take care of them and to give them the treatment that they need.

When it comes to programs for adult handicapped, I think probably

the same situation will exist.

It appears that again we are going to have to find funds, provision for greater Federal participation when it crosses State lines and when the States themselves are unable to provide the funds.

I think that one thing I have not heard pointed out today is that within the United States approximately 2 percent of the total population of the handicapped received last year any rehabilitation services whatsoever.

Of that 2 percent, there were only a very few who received a total comprehensive program of rehabilitation which met all their needs.

That, perhaps, demonstrates the picture a little more. Because it is getting late, I am not going to go into too much more here except that insofar as professional training is concerned, we are operating

affiliation for professional training.

The universities, the schools and the students going to the schools, can get a certain amount of funds. It may not be enough that they are getting some, but in our situation and in any situation which is similar to ours, there is not one thing, not one nickel available to help us take care of these students, but it is expensive to us.

We have to provide clinical instructors. We have to provide educational materials such as books, libraries, and so forth, and we must

provide their living quarters while they are in residence.

We have to provide all this, ourselves, because there are no funds

available.

I think that another thing insofar as research is concerned, the only think I will say there is that funds are needed for applied research which can be carried on within the facility which is handling the

actual programs of service to persons.

Now, as I said, these needs for the handicapped are almost unlimited. It may be heresy to say this, but we question whether the Federal Government should be asked to take care of all these needs. In our opinion there are private funds which are available which will meet, almost are meeting, as a matter of fact, many such needs.

We have found this to be true over and over again.

We would like to make, if we may, a suggestion that when this study is completed, or while it is going on, that certain priorities be established which will be a very difficult job to do, I know, but that priorities of need be established and that it is those priorities which Federal funds be used for.

We think that in our opinion the priorities for funds should be given to the construction of the necessary facilities and funds for pur-

chase of the services within those facilities.

If that is done, we believe that many of the other problems are going to iron themselves out and we think that private funds from a number of different sources can be found to help with many of the other problems which are present.

Thank you very much.

Mr. Elliott. Thank you, Miss McCready, for your testimony here. Our next witness is Mr. Stanley Newman, chief psychologist, Clifford W. Beers Guidance Clinic, New Haven, Conn.

STATEMENT OF STANLEY NEWMAN, CHIEF PSYCHOLOGIST, CLIF-FORD W. BEERS GUIDANCE CLINIC, NEW HAVEN, CONN.

Mr. Newman. I am concerned with emotionally disturbed children. Actually, this is a disability that in many ways is more crippling in the community setting than physical disability.

There is a clear need for psychiatric treatment for emotionally disturbed children, both for those who have a physical disability and

those youngsters who are physically well but socially disabled.

There children mildly to severely disturbed, on seeking this service, usually find it immediately unavailable, nonexistent, or only available after prolonged waiting periods. Even when children are placed on a waiting list the clinics are aware that the need for evaluation or treatment is immediate.

At a time when the demand has increased, the Clifford Beers Guidance Clinic has had to close its intake rather than expand because of

insufficient community and State funds.

Many hours of intensive observation and diagnostic study are required to properly prepare a child and his family for psychiatric treatment. This treatment must of necessity be long, since it takes many years for maladaptive behavior to occur in a child. It is impossible to eradicate or greatly reduce this behavior in a brief period. Years of developing illness must be met by at least a sufficient number of psychiatric hours.

Under these conditions a psychiatric clinic could not possibly see vastly larger numbers of children without a parallel increase of

funds and facilities.

In addition, there is a great need for research, training of personnel, and community education, as well as the services outlined above.

These essential activities are intrinsic to a guidance clinic, but have not been met due to insufficient funds. These activities are often unfortunately sacrified to the immediate need for treating children yet, in the long run, are actually essential for the increased understanding and efficiency of this treatment.

There is a related major problem in this area concerning acutely disturbed children who need short term psychiatric hospitalization. However, these specialized children's wards do not exist and the children must be seen on an outpatient basis; at best, a poor substitute for

adequate observation, care, and treatment.

The various outpatient agencies in the area need a hospital facility

to take over the short term emergency care of these children.

When these kids are seen at our own clinic, they take up a great deal of effort and time and in this way deny treatment to those who can be treated more efficiently. They must be seen within a very controlled setting and we don't have the setting within the area.

The consequence of inadequate child psychiatric care is grave. It means an increase in problems for the local schools in managing these

children, particluarly since learning is frequently blocked.

This loss of human resource is irreplaceable. The consequences for future mental health is likewise grave in view of the fact that adult disturbance frequently results from unresolved emotional problems in the growing child and adolescent.

Thus, it is firmly felt that the best way to attain normal, sensible living in adulthood is to prevent disturbances from developing in children. In order to accomplish this, the needs outlined above

should be adequately met.

In addition, I want to make a brief comment about research. This has been mentioned many times today. I think it has been mentioned so often because of its crucial nature.

Specifically, we need research to understand how to shorten and make more brief our treatment of these children. It is true in hear-

ing, it is also true of the psychiatric area, too.

We must understand ways of getting other individuals not fully professionally trained; for example, teachers, to deal with emotional problems in kids in ways that can help alleviate this problem instead of leaving it only up to the individual guidance clinic. This requires understanding and requires research and, of course, this requires funds.

There are NIH funds, but I think it would be very helpful to supplement these funds with specific grants in aid and also incentives to the various clinics and also to the universities and clinics work-

ing together to install this kind of research.

Also, there is a specific need to train professional personnel within the actual clinic setting rather than the school; in schools usually you have the academic training internships. These internships are generally required within clinics, hospital settings, and so on. We don't have the personnel to train these people.

We have to have specific grants in order to pay supervisors and people or in order to provide facilities to train these individuals.

We have the facilities in schools to train them, but we must place them somewhere. We have to have the clinics and expanded facilities.

As a last point I did want to mention something in terms of Federal aid. I think many people have often questioned the advisability of the Federal Government giving aid. They sort of say, Why put the bite on us. Why don't the State and local communities take care of this?

I think there is another good reason why the Federal Government should step in. When there has been a Federal grant to work out a particular problem in an area it has given such impetus to this problem that the community suddenly becomes aware of the grave nature of it, that their own national office has taken part.

It is interesting to note once this has been done many of the States and local communities want to cooperate to increase their own under-

standing and their own funds.

Often there is no awareness until the Federal Government puts the

finger and focuses upon a very grave problem.

Then you get additional funds. I think in the long run this will relieve the pressure upon Federal funds because the funds are given as a result of impetus by the Federal Government.

Mr. Giaimo. Dr. Newman, you said that the consequences of a lack of adequate child psychiatric care could or would be very grave. Are

we in danger of running into that situation in this area?

Mr. Newman. Yes, in this area.

For example, specifically in the Beers Clinic—and we are really one of the two community clinics within this area—our waiting lists have increased tremendously. Waiting lists are about your best indication of the need.

It is interesting to note that many kids never even get on the waiting list because the people feel, well, they will not take care of us for

a year, so they won't go.

These are the people that need to come in at that moment. It is increasing year by year.

Even though our professional staffs have increased, they have never

been able to keep up with this.

Mr. Giaimo. So we are running into this shortage problem?

Mr. Newman. Yes; the shortage is acute. If you can draw a draft, you find as your personnel increases they can never keep up with the rise on the graph on the incidence of emotional disturbance and, of course, adult disturbances, too.

Mr. Giaimo. This ties in also with the fact that there is a shortage

in research and trained personnel because of lack of funds?

Mr. Newman. Yes. Many, many people have kept away from these areas of psychiatry, psychology, and social work because there were not sufficient training programs in the schools because of insufficient funds. Once they get in the area, there is no incentive to stay in, because if they are interested in research and understanding why these things occur they can't get any money for it. There is no blame involved. It is just the conditions.

These people generally shift out of the area. So we cannot increase the personnel we need enough to keep up with the growing demand. Many people felt, well, these people were always disturbed—we just

never spotted them.

I don't think that is true. I think as a result of the increased difficulties of living that we have today a lot of these emotional disturbances are being triggered off and we have to take care of them.

Mr. Giaimo. What facilities are there for child psychiatry in this

general area here other than your own?

Mr. Newman. We have the Child Study Center, which is affiliated with Yale University, which is similar to our clinic in terms of helping kids with emotional disturbances. They tend to function more as a training and research center, and also in this process, of course, provide service for the kids.

Outside of our two clinics there are no other clinics in the area except those related clinics, family service clinics, and so on, who in their process of helping do, of course, give psychiatric aid, but are

not set up to give continuous psychiatric aid.

Thank you.

Mr. Giaimo. Thank you.

Mr. Elliott. Thank you very much, Dr. Newman.

Our next witness is the Reverend Joseph Pouliot, Goodwill Industries of New England, Bridgeport, Conn.

STATEMENT OF REV. JOSEPH POULIOT, GOODWILL INDUSTRIES OF NEW ENGLAND, BRIDGEPORT, CONN.

Reverend Poulior. In view of the lateness of the hour, Mr. Chairman—and I am sure you and your committee are tired by this time—rather than to read the whole presentation that I have, if I might, I would like to give it to you, and then I will just point up two or three of the items that were not touched on so far as I know this afternoon.

Mr. Elliott. Without objection, the full statement of Mr. Pouliot

will be placed in the record following his oral presentation.

Reverend Poulior. Aside from the opening remarks relative to the worth of such legislation as might come out of these sessions supporting the rehabilitation services not only in New England, but all over the country, I would just like to cite the experience of the Goodwill Industries of Bridgeport, who participated in the act of 1954 as administered throughout the Office of Vocational Rehabilitation.

We received some \$14,000 in expansion grants for the service to

the handicapped of the Greater Bridgeport area.

It was interesting to me in preparing this presentation that a check of wages paid to handicapped people in the Greater Bridgeport area rose from a \$50,000 figure in 1954 and just prior to the receiving of this grant to an anticipated \$260,000 in wages for 1959.

Of course, along with this was training evaluation, other rehabilita-

tion services, which cannot be measured in dollars and cents.

Obviously this expanded activity was due to the grant received but certainly you can take it from me it made a most important role in the development of this rehabilitation center in Bridgeport.

I am just going to give the headings of the six recommendations

that we would like to see incorporated in any legislation.

Expanding educational program No. 1, for all segments, including the labor, management, general public, as well as the handicapped person who is in need of these services.

Item two, funds for training of personnel at the professional and

managerial levels.

Item three, need for funds for the development and implementation of workable, meaningful evaluation services.

Item four, funds for modern adequate facilities and equipment as

may be needed.

Two items I particularly felt had not been touched upon and feel this is a logical development of the first four. It is logical that funds for improved means of transportation be included in the legislation.

Although we provide all of the above services and facilities it is imperative that we make it possible for the handicapped persons to

avail themselves of these services.

Present bills providing for transportation are not adequate to assist many of the severely handicapped. This might include the need of special equipment such as the so-called lifemobile, which is a small bus type vehicle with hydraulic lift.

Proper transportation equipment certainly would transform a homebound handicapped person to a well adjusted productive member

of society.

Item six is the need for revision of the Federal Property and Administration Services Act of 1949 to include nonprofit rehabilitation agencies especially in the light of the fact that some two million dollars worth of surplus property was sold during the last fiscal year at approximately 5 cents on the dollar.

Some of these materials, such as desks, laundry and cafeteria equipment, radio parts, and so forth, could certainly have been used

in assisting the rehabilitation facilities in their task.

In conclusion, the Goodwill Industry of New England are interested in supporting legislation such as this that will assist in the rehabilitation of handicapped persons.

Certainly we wish to thank you, Mr. Elliott and your committee, for hearing us this afternoon.

Mr. Elliott. Thank you very much, Mr. Pouliot.

(The statement referred to follows:)

STATEMENT OF GOODWILL INDUSTRIES OF THE NEW ENGLAND AREA, BY THE REVEREND MR. JOSEPH E. POULIOT, OF BRIDGEPORT

Mr. Chairman and committee members, my name is Joseph E. Pouliot, and I am the executive director of the Goodwill Industries of Bridgeport. I am here not only representing the aforesaid agency but also representing the Goodwill Industries of the New England area on behalf of the Goodwill Industries of America, the parent organization. There are eight Goodwill Industries in this area that I represent, located in Boston, Lowell, Lynn, Pittsfield, and Springfield, Mass., as well as Bridgeport and New Haven, Conn., and Portland, Maine.

field, Mass., as well as Bridgeport and New Haven, Conn., and Portland, Maine. I am not here to promote Goodwill Industries, for I'm sure all of you are well aware of the work that Goodwill Industries is doing on a national basis as well as in the New England area where Goodwill had its beginning. It has become the largest privately operated employment and training agency for the

handicapped in this country.

My true purpose for asking for time to make this presentation was to point up the need for assistance to continue and expand facilities and services to the handicapped, as we of Goodwill see it, in an attempt to service as adequately as possible the greatest number of handicapped possible with the funds that are available. However, we, like most other agencies engage in the rehabilitation of the handicapped, are continually faced with the problem of numbers. These represent an unmet need because they present a particular problem. Of necessity their need is usually weighed against maximum results and funds available.

In many instances, local fund-raising efforts, whether it be through a united effort or through individual appeals, fall short of providing the necessary funds to make possible the adequate facilities and services needed to reach all the handicapped that could benefit from these facilities and services. Many are not even afforded that chance needed to instill within them that desire and motivation to take up their proper places in society. Why? Because available funds

will not permit.

Certainly a good start was made in 1943 with the enactment of the Barden-La Follette Act, then followed by the Vocational Rehabilitation Amendment Act of 1954, as administered through the Office of Vocational Rehabilitation.

The Bridgeport Goodwill participated in that latter act and received a little over \$14,000, which made possible expansion of our services to the handicapped of our area. A recent check of wages paid to the handicapped of the Greater Bridgeport area reveals that in 1954 we paid a little under \$50,000 in wages and other compensation to the handicapped, and it is anticipated after completing 11 months that figure for 1959 will be approximately \$260,000. Along with this, of course, was training, evaluation, and other rehabilitation services that cannot be measured in dollars and cents.

Obviously, this expanded activity was not all due to the grant received; but, gentlemen, take it from me, it certainly played a most important role in this

development. May I also say it was a good investment.

Legislation of this kind for providing funds for needed rehabilitation services, especially in creating services where they are absent (and there is sufficient need), and the expanding and upgrading of existing services is not an expenditure. It is the best investment the Federal Government could make. The handicapped individual who is a drain on public funds can in many instances be transformed to a self-respecting self-sufficient taxpayer if funds available to give him that one chance, though the process may be long and hard.

It is not difficult to go on and on to truly justify funds for the rehabilitation of the handicapped, because it has proven its worth. So, now to get on with what

we feel are some of the unmet needs.

It is apparent that there are many needs of equal importance, and they may vary widely within an area even between neighboring cities; however, we must leave determination of local needs and rather look at general, apparent needs and inadequacies.

(1) An expanding educational program, covering rehabilitation processes—including the vocational aspect of rehabilitation, and also covering the services available, geared to reach all segments of our population, is vitally needed.

Labor and management, as well as the general public, need to be exposed to this knowledge. The handicapped person, more than anyone else, needs to know just what he must do, as well as what can be done for him, to make proper and ade-

quate adjustments.

(2) Funds for training of personnel at the professional and managerial levels to assure adequate upgrading of programs for the handicapped already operating and for new programs seem to be the only possible way of securing proper services both now and in the future. This could be attained through curriculum and scholarships, as well as on-the-job practical training, as in the case of vocational rehabilitation.

Education and training opportunities should also be provided for those unable to attain the levels aforementioned, with the idea of training to the highest level

possible for that particular individual, whatever that level may be.

(3) A need for funds for the development and implementation of workable and meaningful evaluation services is most apparent on every hand, especially for the severely handicapped individual. Such services established since 1955 in Goodwill Industries have proved most successful. The lack of funds in many instances, however, limits our private agencies to clients "most likely to succeed." The person who is likely to reach a relatively low degree of development still deserves to know just that level is and be given services to make even that develop

ment possible.

(4) If there is a need for trained personnel and proper and adequate evaluation, it naturally and logically follows that a need for funds for modern, adequate facilities and equipment exists. In many cases, existing facilities could be utilized to a greater extent, improved, and expanded. Goodwill, by the very nature of its program already demonstrated, favors the type of facility that serves multiple types of disabilities. We believe this helps to breakdown psychological barriers that sometimes exist. We also believe that the voluntary agencies working together with the State and Federal Governments can accomplish the desired results in rehabilitation. The need for funds, however, for buildings, and equipment must be met through a joint program where the community provides all it can and is then supplemented through Federal funds.

(5) It is also logical that funds for improved means of transportation be included in legislation. Although we provide all of the above services and facilities, it is imperative that we make it possible for the handicapped person to avail himself of these services. The present bills providing transportation are not adequate to assist many severely handicapped. This might include the need for special equipment such as a so-called Liftmobile (which is a small bus-type vehicle with a hydraulic lift). Proper transportation equipment certainly would transform many a homebound handicapped person to a well-adjusted production.

tive member of society.

(6) The need for revision of the Federal Property and Administration Services Act of 1949, section 203, to include nonprofit rehabilitation agencies, is also apparent, especially in light of the fact that \$\frac{1}{2}\$ billion worth of surplus property was sold during the last fiscal year at 5 cents on the \$1. Some of this material, such as desks, laundry and cafeteria equipment, chain falls, radio parts, etc., could have been used in assisting rehabilitation facilities.

In conclusion, the Goodwill Industries of New England are interested in supporting all legislation that will assist in the rehabilitation of handicapped per-

sons.

The time is late and I wish to thank this committee for their time and efforts on behalf of the handicapped.

Mr. Elliott. At this point I have a letter from Mr. Herbert D. Welte, president of the Central Connecticut State College, New Britain, Conn., dated September 16, and addressed to me, which includes his statement on the matter that this subcommittee is interested in at this time.

Without objection I will ask that this letter of Mr. Welte be made a part of the record.

(The letter referred to follows:)

CENTRAL CONNECTICUT STATE COLLEGE, New Britain, Conn., December 16, 1959.

Hon. CARL ELLIOTT,

Chairman, Subcommittee on Special Education, Committee on Education and Labor, U.S. House of Representatives, Washington, D.C.

Dear Mr. Elliott: It is strongly recommended that Federal legislation be enacted for the support of programs of special education. If the Nation is to fully discharge its responsibilities for the preparation of all of its citizens to the limits of their capabilities, consideration must be given to the special needs of those who are physically or mentally handicapped. There seems to be four basic problems related to the need for the expunsion of such services:

1. The public and its duly elected representatives, parents, or guardians of those who are in need of special training or education, as well as the individual himself, must be made aware of the responsibilities of a democracy to provide such special training. We must recognize the potential involved in the complete utilization of the human resources of the Nation and we must also recognize that additional funds are required if our full potential is to be realized.

Specifically, it is suggested that the Department of Health, Education, and Welfare provide the leadership in preparing authentic and documented information concerning the causes, the possibilities of correction, the responsibilities of parents and society, the aid which should be provided, the types of training

available, and the adjustment of the adult to the community.

2. A suitable and comprehensive training program should be established immediately and should be made available to all of those who might profit from such training. Imagination and resourcefulness are necessary. Established patterns of education should be temporarily modified and curriculums altered. Certification requirements for the personnel to handle such program may need to be modified in an attempt to enlist the services of former teachers and to attract those whose education, although not specifically directed toward teaching, nevertheless have abilities in this field of special education which might be utilized.

Specifically, it is suggested that the Department of Health, Education, and Welfare develop, promote, and assist in financing: (a) in-service teacher training programs for former teachers and personnel from other professions who might become special education teachers; (b) intensive training and supervision for selected liberal arts graduates; (c) seminars and summer workshops to improve the professional competence of those attracted to the field as suggested above.

3. Policies and programs must be developed in such way that special educa-

tion becomes a recognized responsibility of all communities.

Spectifically, it is recommended that: (a) the present program of preparing teachers of special education needs to be greatly expanded; (b) the concept of training necesary to handle the problems of special students must be greatly expanded to include all of the resources of the community, including those professions with personnel of special abilities.

4. Through experiment and research, existing programs must be critically

evaluated.

It is specifically suggested that the Department of Health, Education, and Welfare sponsor pilot training programs which would emphasize the multidiscipline approach and which would combine clinical services, laboratory experiences, and the training of specialists in all fields of special education, e.g., the very bright, the mentally retarded, the physically handicapped, the cerebral palsy, etc. It is believed that observation of all such special cases under a controlled situation might provide a key to the development of sound programs and techniques applicable to each type. Such program would necessarily expand the concept of education as suggested in 3(b) above and would require such special services as provided by a speech clinic, physical therapist, etc.

5. Finally, any comprehensive program should be based upon recognizing that in our society it is our collective responsibility to prepare every individual to his maximum capabilities, including those who are physically or mentally

handicapped.

Respectfully yours,

HERBERT D. WELTE, President.

Mr. Elliott. I have a letter from Mr. Frank Kowalski, a Member at Large of Congress from the State of Connecticut, stating:

I regret that I cannot be present for your hearings in Connecticut. For the consideration of your subcommittee I am submitting a statement of my views on the legislation with which your hearings are concerned.

The letter and the statement, without objection, will be made a part of the record at this point.

(The letter and statement referred to follow:)

House of Representatives, Washington, D.C., December 16, 1959.

Hon. CARL ELLIOTT,

Chairman, Subcommittee on Special Education, House Committee on Education and Labor, Federal Courtroom, U.S. Post Office Building, New Haven, Conn.

Dear Mr. Chairman: I regret that I cannot be present for your hearings in

Connecticut.

For the consideration of your subcommittee, I am submitting a statement of my views on the legislation with which your hearings are concerned.

Yours sincerely.

FRANK KOWALSKI,

Member of Congress.

STATEMENT BY CONGRESSMAN AT LARGE FRANK KOWALSKI, OF CONNECTICUT

Mr. Chairman and members of the subcommittee, we in Connecticut are grateful to you for arranging to hold hearings in our State on legislation with which many of our citizens are deeply concerned. I am sure that the hearings, and the workshop held in conjunction with them, will provide you with much valuable data.

I trust that your subcommittee will see fit to recommend a rehabilitation act, with its most laudable goal of "independent living." Only through the assistance of our National Government can the several States provide the programs which are so desperately needed to restore dignity and independence to the handicapped and the elderly who are now ineligible for vocational rehabilitation.

I also urge that you give favorable consideration to legislation to expand and

I also urge that you give favorable consideration to legislation to expand and improve teaching and training facilities for those with hearing and speech

defects.

The experts in these fields are submitting technical testimony, but I know that you will also consider the tremendous human values that are involved. Your subcommittee can make a great contribution to America by recommending strong legislation in the two fields I have mentioned.

Mr. Elliott. Now we have for tomorrow scheduled 40 witnesses.

In order that we may hear all of those witnesses tomorrow, it will be necessary, I think, that we begin at 9:30 in the morning. Is there objection to that?

We will begin at 9:30 tomorrow morning.

(Thereupon, 5 p.m., the hearing was recessed, to reconvene at 9:30 a.m., Friday, December 18, 1959.)

SPECIAL EDUCATION AND REHABILITATION

FRIDAY, DECEMBER 18, 1959

House of Representatives,
Subcommittee on Special Education,
of the Committee on Education and Labor,
New Haven, Conn.

The Subcommittee on Special Education met, pursuant to recess, at 9:30 a.m., in the Federal Courtroom, U.S. Post Office Building, New Haven, Conn., Hon. Carl Elliott, chairman of the special subcommittee, presiding.

Present: Representatives Elliott, Daniels, Giaimo, Wainwright, and

Lafore.

Mr. Elliott. At the beginning of our second day of hearings here in New Haven I have several statements for the record. First, I have from the Honorable James C. Oliver, a Member of Congress from the State of Maine, First District of Maine, a statement in behalf of the matters that we are studying here and at this point, without objection, I offer that statement for the record.

Second, I have from Dr. Frederick T. Hill, of the Thayer's Hospital, Waterville, Maine, a statement, dated December 8, urging the passage

of House Joint Resolution 316.

Third, a statement from Harold N. Willard, director of rehabilitation, Thayer Hospital, this statement being in regard to the inde-

pendent living bill.

A letter from Robert E. Belyea, dated December 17, 1959. Mr. Belyea is the director of educational therapy of the Institute of Living, Hartford, Conn.—together with a paper with respect to the general problems that we are studying.

Next is a statement from Dura-Louise Cockrell, dated December

14, 1959, addressed to me.

Next is a statement by Katharine C. Cotter, coordinator of program of special education, Boston College School of Education, Boston, Mass.

Next is a letter addressed to me from Gray H. Curtis, executive director for the department of education, vocational rehabilitation division, Augusta, Maine, dated December 11, 1959.

With it is a copy of the letter he has written to the Honorable

Margaret Chase Smith, U.S. Senator from Maine.

With it also is a statement with respect to the unmet needs of the

handicapped in Maine.

Next is a letter dated December 15, 1959, addressed to me, from Miss Kathleen Kirby, executive director of the Worcester County Hearing and Speech Center, Inc., Worcester, Mass.

(The documents referred to follow:)

TESTIMONY BY HON. JAMES C. OLIVER, MEMBER OF CONGRESS (FIRST DISTRICT, MAINE), IN SUPPORT OF LEGISLATION TO PROVIDE FOR (1) TRAINING TEACHERS OF THE DEAF, SPEECH PATHOLOGISTS, AND SPEECH AUDIOLOGISTS, AND (2) INDEPENDENT LIVING LEGISLATION

Mr. Chairman. The two topics, which your distinguished subcommittee is considering today, graphically illustrate one of the most serious problems we face as a Nation. The United States cannot continue to permit the needless loss of its human resources. Funds expended to rehabilitate physically handicapped children and adults constitute an investment which will pay for itself many times over in terms of reclaimed lives and positive contributions to our society.

In my State of Maine alone, it has been estimated that there are 11,645 speech and 5,169 hearing defects which remain undiscovered in school age children. Many of these children may have been mistakenly identified as retarded, when in fact their inability to comprehend can easily be remedied. The problem lies in detection. Unfortunately, there is an appalling lack of trained technicians who are capable of recognizing the existence of hearing and speech deficiencies. If we expect to meet the problems of the 8 million American citizens handicapped by speech and hearing defects, a total of 20,000 speech pathologists and audiologists are needed rather than the presently inadequate 2,000 certified to deal with these problems. In addition, there is an annual need for 500 teachers of the deaf while we are presently educating only 150 each year.

The legislation under discussion would go a long way toward meeting this deficiency. A relatively small total of \$3.5 million would directly result in the rehabilitation of the vast majority of the 8 million Americans who are presently incapacitated. Through Federal grants to public and nonprofit institutions engaged in training teachers of the deaf, we can enable many physically handi-

capped Americans to live normal, productive lives.

My distinguished colleagues, the chairman of this subcommittee and the gentleman from Rhode Island, Mr. Fogarty, have introduced important legislation which would revitalize our Federal vocational rehabilitation program. One change that they propose in existing law is particularly significant. At the present time, a phyliscally handicapped individual may only receive assistance if there is a reasonable expectation of his future employability. The bill which the committee is now considering would extend assistance to those handicapped individuals who can achieve a degree of independence which will enable them to dispense with expensive hospital or private medical care. Experts in this field agree that this extension of rehabilitation service would in fact bring about the vocational rehabilitation of many for whom there was felt to be no hope.

The legislation under discussion also provides for the expansion of existing rehabilitation facilities, into fields such as the establishment of workshops for the mentally retarded, mentally ill, and cerebral palsied. A modest sum is also proposed for allocation to the President's Committee on the Employment of the Handicapped. This committee has done an excellent job in publicizing the need for employment of the physically handicapped, but desperately requires and additional annual appropriation of \$75,000 to expand its informational

activities.

I strongly urge passage of the legislation which is under consideration here today. Enactment of these bills makes sense not only from the point of view of the individuals concerned but from the national standpoint as well. In these days when the United States is faced by a serious external threat, all available manpower is needed. By refusing to enact this legislation, we are, in effect, denying our country the efforts of men and women who have the talent to contribute constructively to our Nation. We not only can, but must, restore the physically handicapped to productive, independent roles in our society through passage of this legislation.

I am honored to submit the statements of Dr. Frederick T. Hill, medical director of Thayer Hospital, Waterville, Maine, and Dr. Harold N. Willard, director of rehabilitation at Thayer Hospital, for consideration by the subcommittee. I feel that the views of these doctors, who have had years of practical experience in dealing with the problems under discussion, should be

to have a f

given thoughtful consideration.

Health and the American Public Health Association are among the national bodies that have studied the opportunities, the responsibilities and the measures to be taken, along with the costs and the dividends.

Our Connecticut White House Conference Committee for Children, 1959, and our new White House Conference Commission on Aging are directing specific

attention to these problems.

4. A few comments may be made, and questions raised concerning some of the

bills which have come to attention.

On January 7, 1959, and on January 27, 1959, were introduced bills H.R. 1119 by Mr. Fogarty and H.R. 3465 by Mr. Elliott, respectively, both "To provide evaluation of rehabilitation potentials and rehabilitation services to handicapped individuals who as a result thereof can achieve such ability of independent living as to dispense with the need for expensive institutional care or who can dispense with or largely dispense with the need of an attendant at home to assist in the establishment of public and private nonprifit workshops and rehabilitation facilities and for other purposes."

The purposes are clear and indicate foresight in developing planning. section 2(a) of H.R. 1119, an amendment is obviously related to Public Law 565, 83d Congress, chapter 655, 2d session, S. 2759, an act. Provisions for grants under section 202(g) title II seem to be clear. Under section 203, page 7, is a new State rehabilitation agency intended in lines 11 and 12? Improvement of conditions in existing agencies in a manner to provide for joint planning and cooperative action and adequate medical guidance will be important: and it is hoped that multiplication of State agencies will be avoided. The preparation of a "flow chart" and of methods for distribution of authority and funds in some localities will show the confusion and cumbersomeness of too many "cooks", often operating somewhat independently even though the intention is to benefit a handicapped person and a family. On page 12 of this bill, page 12, under definitions, and the same in H.R. 3465, what is meant by "therapeutic treatment"? Does this include medical advice, prescription, and supervision? On page 13 of these bills, line 2, will he "no longer require such institutional care", or that such care and attendance may be substantially reduced, or does this imply no care as referred to possibly on page 2, (b), line 10 and 11?

On page 15, (b)—in considering "but not be limited to * * *" reference may be made to paragraph (B) on page 15 as to relationships. Possibly this might state something such as: the following provided they are under medical direction, or supervision, with prescription. Among the ideas here is the question if

there is enough reference to medical guidance.

Turning to the good House Joint Resolution 316, of Mr. Fogarty of March 19, 1959, paragraph 2 of page 1, does the term remediable in 80 percent of the cases refer to medically remediable or to other factors? In paragraph 3, is the definition of rehabilitation worker clear in this context? On page 2, should emphasis be given under reference to training that this can be done best in a medical setting, preferably in affiliation with a medical teaching institution? On page 3, reference to medical supervision is lacking. On page 4, is it practical in lines 6 and 7 to include a medical practitioner? When we see the value given by Dr. Krusen in the Office of Vocation Rehabilitation recently, we see great possibilities. On page 5, section 4, advisory committee, members "shall be chosen from" etc. This is good but is not in the Elliott bill—House Joint Resolution 494. Is a person in physical medicine desirable? In House Joint Resolution 494, is there sufficient provision for medical help and advice? (e.g. p. 4, lines 13-20.) On page 5, lines 11-17, no M.D.'s are mentioned.

5. Illustrative Histories

(a) My attitude, both personal and professional, toward comprehensive rehabilitation was profoundly influenced by an intimate and impressive experience I had with a college student and his family. He lost the sight of one eye, had both hands blown off, and suffered other injuries in a laboratory explosion in 1938. The initial effect of this accident, in the midst of his professional education, was shattering to his morale and greatly handicapped him physically and in building a satisfactory career, but through sympathetic and highly skilled assistance that was fortunately available to him, he went on to complete a Ph. D. degree in chemistry and has become internationally known in the highly technical field of combustion, in its application to jet engines, rockets, etc. He drives his own car and travels extensively by himself, in the United States, Europe and

the Far East. He has achieved a happy home life, is the father of two boys who he joins frequently on skiing outlings, and is active in his church and the social life of his community. The native intelligence and courage that this man possessed contributed greatly to this happy result, but it is very doubtful if these would have been nearly as effective without the understanding, encouragement and training received from rehabilitation personnel.

(b) Two case histories from the experience of a former Welfare Fund Medical

Director, now a hospital director, will illustrate this further.

Case 1.—A 37-year-old woman became aware of increasing weakness and numbness in her legs and a few months later she was unable to walk. The diagnosis of a small hospital in another State was multiple sclerosis, with loss of sensation and use of legs. As many of you know, the cause of this disease is not known, but sporadic patches of sear tissue develop in the brain and/or spinal column, causing a variety of disorders.

The Welfare Fund referred her to a rehabilitation center, where a diagnosis of spinal cord tumor was made and a successful operation removed a benign

tumor close enough to the spinal cord to have caused the symptoms.

She is now a healthy woman having avoided the life of a severely handicapped person because of this evaluation. The cost to the fund was \$1,000, but the cost to the community for her care would have been many times as much if she had not received a sound diagnosis and excellent management for an unexpected condition.

Case 2.—An 11-year-old girl developed slowly progressive weakness of her legs in July, 1945. In 1949 her situation was brought to the attention of the fund by her family physician. The diagnosis, muscular dystrophy—another

disease of unknown causes—gave little hope to all concerned.

She was sent to a rehabilitation center in March 1949, where a deficiency disease that can be controlled by regular medication, was diagnosed. She was discharged within 2 months "very nearly a normal girl, as long as she continues to take regular doses of a medicine—prostigmine. She finished her high school education, married in 1953 and has three healthy children. At a cost of less than \$3,000 and because of a thorough evaluation, she is living a normal life

and avoiding the suffering and expense of disability.

(e) Prior to my becoming a member of the board of directors of Gaylord Farm Sanatorium, its services had been limited to the care and rehabilitation of persons afflicted with tuberculosis, for which it had an outstanding reputation over some 50 years, under the direction of a wise and skillful and understanding physician, Dr. David Lyman. Since this disease is being brought under control through improved treatment, Gaylord has had an opportunity to broaden its field to include rehabilitation services for persons having any remediable disability. I will now cite three case histories from our experience there, that I think will be helpful to the committee.

Case 1.—A 64-year-old man was admitted in December 1956 with his left leg amputated above the knee, diabetes in mild form and congestive heart failure due to an insufficient supply of blood to the heart muscles. A year prior to admission his wife had died, after prolonged suffering, from cancer. Since her death he lived alone, ate irregularly at various restaurants and never regained interest in living. His diabetes got out of control and possibly because of this, his left foot became so badly infected that his leg had to be amputated

above the knee.

Following amputation, he was admitted to Gaylord in no mood for vocational rehabilitation or independent living. Readjustment to the point that a nursing home could handle his medical and social needs seemed about the best that could be expected.

This man was a patient from December 28, 1956, to June 28, 1957. He received daily medical supervision; rehabilitation nursing; frequent laboratory studies; physical, occupational, and work therapy; social service; vocational counseling and guidance; planned social activities; a therapeutic diet, and practical instructions about the preparation and selection of food.

As the treatment progressed, the patient began to develop higher goals for himself which he "sold" to the Gaylord staff and to the Connecticut Bureau

of Vocational Rehabilitation.

Men in their 60's are often unable or unwilling to use artificial limbs, but we found in this man such a desire for self-sufficiency that an artificial leg was purchased for him by the Bureau of Vocational Rehabilitation. While the patient was not well coordinated, he was so well motivated that after several

weeks he could walk. Today, he is living alone in a small neat apartment, where he does all of his own housekeeping and cooking. The rest of his story is best told in his own words in the following letter which I received from him under date of June 9 of this year.

"Dear Doctor: You will, I am sure, be glad to hear from one of your former patients, a patient who was brought under your charge on a stretcher, with yery

little expectation of ever being thankful for anything or anybody.

"Today I am glad to inform you I am employed in a business office, drive a car, have paid back to the State welfare the money they advanced for my hospital care, and am paying the bills accumulated during my wife's and my illness. All this I attribute to the treatment I received at your institution—the physical therapy, the medical care, the personal attention, and the followup after I left Gaylord. Again I want to thank you for what you did for me and are doing for others. Gratefully yours."

I would like to remark here that rehabilitation is not the most remunerative field open to the doctor of medicine and one engaged in it who does not get a big lift out of such a letter would do well to change to a field where the remunera-

ation is paid entirely in money.

Case 2.—A 37-year-old woman with three children under 9 years of age was admitted to Gaylord on February 22, 1956. A college graduate, with a master's degree in music (piano), she had taught for several years. She was disabled by a devastating disease, lupus erethematosia, which had affected her nerves, joints, and internal organs, causing severe pain and paralysis of muscles. She could not move any muscles below her knees or lift her arms above shoulder level; her fingers were partially paralyzed.

At the time of her admission there was little hope of her return to her family in a useful capacity and no hope for her to again teach plano. The family situation was chaotic; her mother attempted to take care of her three small children. Her husband was unable to carry out his job to the best of his ability because of

demands at home and concern for his wife.

For many months she had an "up and down" course; with her considerable courage and determination, thoughtful physician management, intensive nursing care, physical and occupational therapies, she was finally able to return to her home. Upon her discharge on March 25, 1957, after more than a year of hospital care she could walk with two short leg braces free of pain. She tires easily, with with scheduled rest she manages her home, her children, and is again teaching piano. Most important, she is home with her family, without need of daily medical care.

Case 3.—A 19-year-old boy was admitted June 20. 1956, with a 2-year history of Guillian-Barre syndrone—a disease affecting the body's nerves, which is marked by pain, tenderness, and weakness in the muscles supplied by the affected nerves. After staying 9 months at a medical center and 1½ years at a chronic disease hospital, he came to Gaylord so limited in his abilities that his only diversion was painting by holding the brush in his teeth. There had been no noticeable

progress during these 27 months.

The goal was to teach him to live independently. Special devices were prescribed so he could increase his usefulness. Daily physical therapy also served to prevent contractures at the joints. His muscle strength gradually improved. Special devices became unnecessary. Our reevaluation gave us confidence to plan even beyond the goal of independent living—useful employment.

One year after admission he was discharged, completely independent. Using one cane, he attended his high school graduation. For the past year he has been

employed by the Fuller Brush plant in his hometown.

This successful rehabilitation required the cooperation of 15 separate services, as well as the patient and his family.

General methods employed

The above specific cases are generally typical of the methods employed at Gaylord.

We feel that a large number of highly trained, highly skilled services are required for the best results. In addition to a full-time staff of doctors, nurses, therapists of various kinds, and social workers in the several categories of human need, we are fortunate in having a consulting staff of outstanding specialists from the New Haven area who visit Gaylord twice a week to consult with the full-time staff on special problems. With this staff, we feel we have the best advice available on almost any condition that may be encountered.

We also maintain close working arrangements with several medical centers, including the Grace-New Haven and Hartford Hospitals; all of Connecticut general hospitals; and all voluntary and special agencies offering related services. Following discharge from Gaylord, the services of family physicians, visiting nurse associations, and rehabiltiation centers, such as those established in New Haven, Hartford, Stamford, and Meriden, are freely used and have proven most

In addition to the above, we feel that it is very important that a patient's skills, his remaining abilities, or his potential abilities, should receive imaginative consideration and for this purpose a workshop equipped with a variety of machines and hand tools, is invaluable. Gaylord was fortunate in receiving a special grant from the Office of Vocational Rehabilitation in July 1958 for developing such a shop. This shop enables the staff to measure and develop work tolerance while exploring work skills, but most important is the effect on a patient's morale of finding himself able to do usful work. It banishes the enervating feeling of uselessness and dependency and gives him the courage to seek self-support.

Mr. Giaimo. Dr. Robeliff V. Jones, Jr., associate in physical medicine and rehabilitation, University of Connecticut, will be our next

H. Kenneth McCollam, executive secretary, Connecticut Board of Education for the Blind, and Guy Marchisio, chief, Children's Service, Connecticut Board of Education for the Blind.

STATEMENT OF H. KENNETH McCOLLAM, EXECUTIVE SECRETARY, CONNECTICUT BOARD OF EDUCATION FOR THE BLIND, HART-FORD, CONN.

Mr. McCollam, I am H. Kenneth McCollam, executive secretary of the Connecticut Board of Education for the Blind.

I am going to speak briefly from the braille outline that I have before me.

If I may, I request the permission of the committee to file a copy of

what I am going to say and try to cover at a later date.

Mr. Giamo. Without objection, you may.

Mr. McCollam. I would like also to cover briefly the rehabilitation aspects of the discussions that we have before us and ask Mr. Marchisio to follow me with a summary of the matters pertaining to special education.

I want to open by expressing gratitude to the committee for the privilege of coming before you and also for the rare privilege that I think all of us had in sharing in the workshop study group that has

been held in the previous 2 days in New Haven.

In connection with that, I think it gives those of us who at the agency level work with the blind a rare opportunity to meet with people of all interests in work for the blind, including, as Mr. Istas pointed out, people representing the Federation of the Blind and others with whom we sometimes have difficulty in sitting down with and sharing their thinking.

This has been a very worthwhile meeting and I think all of us have

gotten a great deal out of it.

In connection with that, I wish to go on record here in favoring the report submitted by the workshop project by Mr. Greehan and we thoroughly endorse all of the proposals that were presented by him.

I would also like to go on record in favor of the bill for independent living as presented in 3465. We feel that that is a type of legislation that is seriously needed in work for the blind in particular, although it has many great benefits to other types of handicaps than the blind.

We feel that the rehabilitation setting and the training that agency people have would be the proper place for the administration of the

independent living provisions.

I would like further to recommend that the opportunity for training of personnel through grants, through traineeships, or through any of the many other avenues for obtaining specific training in the areas of the handicapped be encouraged and promoted in every way possible.

As many of you have already been told by other people who have presented their view here, there are a great many areas in which there is need for skilled professional workers working with the handicapped

groups.

One particular group that I wish to mention particularly would be that of mobility trainer. We all know the difficulty that presents itself to any blind person in getting about. In recent years there has been developed a skilled mobility training and getting about by the use of cane or other recognized methods of guidance.

There has been no place in the country up to this point where a person may be trained in the skills which he could then later impart

to blind clients.

If at all possible through the provisions of any of the bills before

us we would urge that attention be given to this particular lack.

There has been a study made recently by the Office of Vocational Rehabilitation in conjunction with the American Foundation for the Blind in this area, and we hope from that will come some definite

proposal.

Another point that I would like to emphasize again in the field of training, the need for a type of apprenticeship training that might be possible wherein a well trained, from an educational or academic point of view, a well trained individual, who may come out of one of the courses that Congress has made possible through the extension of the Vocational Rehabilitation Act, come out with a master's degree, but with no practical application of the theory that has been learned and learned well.

What I would suggest here is that Congress, through extension of the Vocational Rehabilitation Act, make possible grants which could be used for the financing internship or apprenticeship type of course in the States whereby these college graduates, ofttimes with a master's degree, can obtain a practical experience necessary to make them a

worthwhile worker in the field of work for the blind.

The reason that the State cannot always do this or accomplish this very thing is because of the limitation of budgets, also the fact that there are serious restrictions on the matter of taking a person on your staff and then having to put him through a lengthy training period or

internship.

I would also like to speak briefly on the broadening of the provisions of the Hill-Burton bill, which would encompass the establishment of rehabilitation centers, possibly not medically oriented or medically backed, but the type of center that would provide to blind people throughout the country the facilities that they are so rarely lacking in the field of prevocational and vocational training.

We have centers throughout the country for adjustment to blindness. The number of centers or places where we can expose blind clients to prevocational training or limited vocational training as well as the exposure to the various social needs of the individuals are lacking to a very high degree.

In the New England region some studies have been made by the Office of Vocational Rehabilitation with the thinking that perhaps

a regional center might be established.

The numbers that have been indicated on the basis of this study are relatively small and it seems that it might not be feasible for a re-

gional center for the blind alone.

I would welcome any thinking that might be possible in following out the recommendations of one of the previous speakers that a rehabilitation center on a regional basis for other types of handicap might also include the rehabilitation and training of blind individuals.

I would also like to endorse the recommendation made by Mr. Mungovan of Massachusetts at the hearing yesterday on the matter of the withdrawal of the need for applying the means test for readers

for blind students.

That has presented a great deal of difficulty. We are allowed under the provisions of Public Law 565 to pay for tuition for a blind student without necessarily applying the means test. When we have to provide him with readers in order to obtain the education that he needs, we do have to make the application of the means test under the present provisions.

I would like very much to see that changed if at all possible.

In the interest of time I think perhaps now I will relinquish the balance of the time that has been allotted to me to Mr. Marchisio to deal with the special education.

Mr. Giaimo. Thank you, Mr. McCollam.

May I say to you, Mr. Marchisio, in the interest of time will you summarize your statement as best you can and then leave your prepared statement with us.

(The statement referred to by Mr. McCollam follows:)

OUTLINE OF NEEDS OF BLIND PERSONS IN CONNECTICUT AND PROPOSAL FOR CHANGE IN EXISTING LEGISLATION

(By H. Kenneth McCollam, executive secretary, Board of Education of the Blind, Hartford, Conn.)

The board of education of the blind is an independent State agency charged with the responsibility of bringing multiservices to the blind of Connecticut. The register of known blind persons contains the names of some 3,700 individuals. The current budget of the agency calls for the expenditure of \$600,205 annually and of this amount \$327,200 is expended for education of blind children.

Representatives of this agency had the privilege of sharing in the 2-day workshop sponsored by the study committee established under the subcommittee of Congress and wished to go on record as endorsing the proposals submitted by Mr. Frederick D. Greehan, chairman of the section working with the visually

handicapped.

The agency would further wish to be recorded as in favor of the passage of the independent living bill 3465 that is presently before Congress. It is the belief that the needs of blind persons could best be met by the administration of this new program through the well-established and professionally staffed personnel of the agency presently carrying out the provisions of the vocational rehabilitation program.

In order to meet some present gaps existing under the Vocational Rehabilitation Act of 1954 (Public Law 565), it is further recommended that Congress make available training grants to universities or colleges to establish training programs for mobility instructors for the blind. The need for mobility is probably one of the greatest in work for the blind that exists at the present time. Attempts through organizations such as the Hines Hospital of the Veterans' Administration and a few additional provide adjustment cetners to mee this need; but the number of trainess that they are able to accept is so limited that years will be required to begin to meet the need in the several States. It is estimated that Connecticut might well use the services of two or more mobility instructors on a full-time basis, if properly trained personnel were available.

A secondary training project which seems highly desirable in the effort to obtain well qualified and trained personnel in the various areas of work for the blind, is the need to establish a training grant available to the several States that would provide the adequate compensation for an apprenticeship trainee for a period sufficiently lengthy to give him the much needed practical experience in the area of work for which he had been academically trained. Many persons are utilizing the training privileges under Public Law 565 to obtain master's degrees in vocational rehabilitation but have no opportunity to gain practical field experience that would enable them to be employed directly by a State agency. Most State agencies require/at least 1 year of experience beside the college

education.

It is suggested that the Hill-Burton law be amended to permit the use of the funds available under its provisions to be used for establishment of a rehabilitation center that would include prevocational and vocational training over and above the medical services which are presently required. It is suggested that studies be made to determine the need for such rehabilitation centers on a regional level and of a nature that would offer services to blind clients as well as to those of other handicaps.

It is recommended that a study be made of the application of the formula for allocating funds under Public Law 565 to reflect the need of certain States with a high per capita income who are receiving meager allocations of funds under section II of the allotment, which involves additional support funds available to the States as a whole. For example, in Connecticut, over the past 4 years when rehabilitation funds to the States in general have risen from \$23 million to \$53 million, this State has received only the following amounts of these funds:

1956	\$63, 045
1957	58, 322
1958	48,885
1050	44 899

It is recognized that the general application of the formula used in allotting funds to the states is generally acceptable to the country as a whole. It could be readily seen, however, that the great benefits derived by States with lower per capita income are being denied to Connecticut where despite the financial well-being of the State in general, there are limited funds available for vocational rehabilitation purposes. It is suggested that some thought be given to providing additional funds over and above the formula quota that could be made available on a State-matching basis of dollar for dollar.

This agency would also favor the removal of the requirement under the regulations of Public Law 565 of application of the means test to the provision of reader services to blind students. This regulation does not seem to be consistent with the payment of tuition fees without application of the means test, while at the same time the necessary reading service to permit a blind student to

pursue his studies should be so stipulated.

It is further recommended that the provisions of the aid to the blind be modified so as to permit a larger amount of earned income to be exempt before an AB grant would be modified. The original provisions of the act stipulated that \$50 a month of earned income would be exempt. It is recommended that this exemption should be amended to read \$100 of income from any sources be exempt.

This agency wishes to express appreciation and gratitude to the committee for making it possible to appear and to participate in the workshop and hearings in connection with its study. It is further requested that this written

report be made a part of the congressional record of the hearings.

STATEMENT OF GUY MARCHISIO, CHIEF, CHILDREN'S SERVICES, CONNECTICUT BOARD OF EDUCATION FOR THE BLIND

Mr. Marchisio. Mr. Chairman, gentlemen of the committee, I would like to say initially that these points that I presented, these recommendations, although given to you from the point of view of Connecticut, I believe they apply pretty much to the whole country.
We have some eight points. We are asking that Federal help be

given in the preschool area.

Very few of the States have sufficient funds particularly to help parents with the problem of blindness in children. Very few States, including Connecticut, have outright funds for this program.

We think this should become a definite part of the educational program. This is true of blind children as well as any other children where not only do you need help to assist the parents but a more formalized type of service is needed in terms of getting the children ready before school.

Two, the establishment, as has been mentioned here several times, of the regional diagnostic and treatment centers. The centers, par-

ticularly for multiple-handicapped children.

I would like to stress multiple-handicapped blind and also emphasize the emotionally disturbed ones. This is likely to be an area that is omitted in the states where the service is for physically handi-capped, but not for the emotionally disturbed or people with emo-

tional problems, with the additional handicap of blindness.

Three, again I think you have heard on this, the establishment and award of scholarships and graduate fellowships, not only on the university level. I am a little concerned about this, having taught at the university level myself, and this can become quite theoretical.

I think there should be two additions added to our scholarships, two

phases:

One, that these also be given on a part-time basis as well as a fulltime basis; that is, a person who is already working on the job, particularly in the teaching field where training is very expensive and salaries are not too high, and also in terms of practical knowledge.

Scholarships for training centers, for traveling to agencies and centers to see what is going on, this type of thing, as well as university

training.

Four, I would like to read this one.

(A) Increase the Federal quota grant substantially above the \$30 per pupil basis with a formula that will not place the smaller States at a great disadvantage.

(B) Distribution of the Federal quota grant to additional and varied manufacturers of educational materials and equipment for all

visually exceptional children.

(C) Provision for proportionate representation from both public school and residential school personnel (ex officio members of the board of trustees) in the administration, selection, manufacture, and distribution of materials and equipment from the American Printing House for the Blind.

Now, our fifth point is asking that statistics be included in the

census.

I think you have heard from this one before, particularly in the light of the population, the age distribution and the job classification of all legally blind people.

Six, a redistribution of the regional libraries for the blind.

The State libraries where you actually have a reflection of the State needs.

A recognition that blindness is not total blindness alone, that these libraries should distribute large print materials to partially seeing

people, particularly in the literature, the nontextbook line.

Seven, the serious dearth of large print textbooks and other literature, after decades of sporadic effort, remains one of our most urgent problems to be solved as far as the partially seeing child is concerned. Many people have tried to tackle this and do something about it, but very little has been done. If you find that the States cannot lick this problem, then perhaps this is the time for the Federal Government to step in.

There is nothing, very little in the literature, in the recreational reading line, of large print books. We are asking here that the Federal Government make a study and perhaps distribute this material from the American Printing House and through the Library of

Congress or grants to States.

Finally, I would like to preface my remarks on this one because I have been a great booster for volunteers in the area of blind people,

of helping to transcribe braille books and so forth.

In fact, I am on the board of trustees of the national organization and also very active on the executive board of the National Braille Club, so I would like to show appreciation of what the volunteers have done and there is a place for them.

However, my point is that the blind are almost the only group of handicaps that have to depend on volunteers in their formal education. Therefore, we say legally blind children are entitled to an education at least equivalent to the education they would have had if they could see sufficiently well to do their schoolwork in the usual way.

In this regard the Federal Government should seriously consider the possibility of paying for the materials ordinarily provided by volunteers, thus instituting a service adequately designed to meet the need, when needed, and without fostering the very charity that has followed the blind individual through the ages.

This may be done through direct grants to the States, through agreements with publishers, or through the Library of Congress or American Printing House for the Blind acting as a clearinghouse for

subcontracting orders from the States.

Thank you very much.

Mr. Giaimo. Thank you, Mr. Marchisio. (The statement referred to follows:)

A STATEMENT CONCERNING EXPANDED SERVICES TO VISUALLY HANDICAPPED CHILDREN AND YOUTH BY THE FEDERAL GOVERNMENT

(By Guy J. Marchisio, chief of children's services, State Board of Education of the Blind, Hartford, Conn.)

There are a number of unmet and partially met needs to blind and partially seeing children and youth in which the Federal Government may help and in which the States are finding it difficult to provide services.

1. Recognize the preschool service to blind and partially seeing children as an adjunct to formal education by providing Federal matching grants to the States in a phase of the work lacking sufficient funds for stimulating early preparation for school. Such a service should include individual instruction and counseling

to parents and children as well as nursery school training.

2. The establishment of regional diagnostic and treatment centers and the provision of such services within presently recognized facilities through Federal grants to the States for building and staffing facilities for minimal-cost service for multiple-handicapped children and blind and partially seeing children with additional handicaps, to include visually handicapped children with emotional problems.

3. Substantial scholarships and graduate fellowship aid for the personnel concerned with all phases of education of visually exceptional children on both a full- and part-time basis. Some Federal grants are available for this purpose on a full-time basis, but little or no funds are provided for staff development in a field where salaries are low and cost of training is high. grants are now available to vocational rehabilitation staff in the several States

under the Vocational Rehabilitation Act 4A1—special projects grant.
4. (a) Increase the Federal quota grant substantially above the \$30 per pupil basis with a formula that will not place the smaller States at a great

disadvantage.

(b) Distribution of the Federal quota grant to additional and varied manufacturers of educational materials and equipment for all visually exceptional

(c) Provision for proportionate representation from both public school and residential school personnel (ex officio members of the board of trustees) in the administration, selection, manufacture, and distribution of materials and equipment from the American Printing House for the Blind.

5. Provision in the Federal census for accurate statistics on the population, age distribution, and job classification of all legally blind individuals in the

United States and in the several States.

6. Redistribution of the regional libraries for the blind to State libraries for the blind that reflect State and community needs. A recognition that blindness is not total absence of sight through the distribution of large print books as well as braille and recorded literature by these libraries. A speedup in the number

and variety of talking book records for children is urgently needed.

7. The serious dearth of large print textbooks and other literature, after decades of sporadic effort, remains one of our most urgent problems to be solved as far as the partially seeing child is concerned. It is highly recommended that the Federal Government, through quota grants, extend this service to both the legally blind and true partially seeing child and that extensive research be initiated for obtaining the exact title requested, nonbulky books, most appro-

priate size type, and multicolored photographs and pictures.

8. Legally blind children are entitled to an education at least equivalent to the education they would have had if they could see sufficiently well to do their schoolwork in the usual way. In this regard, the Federal Government should seriously consider the possibility of paying for the materials ordinarily provided by volunteers, thus instituting a service adequately designed to meet the need, when needed, and without fostering the very charity that has followed the blind individual through the ages. This may be done through direct grants to the States, through agreements with publishers, or through the Library of Congress or American Printing House for the Blind acting as a clearinghouse for subcontracting orders from the States.

Mr. Elliott. Has Mr. Arthur L. DuBrow come in? If not, our next witness is Dr. Charles J. Klim.

Is Dr. Klim here?

Dr. Klim. Yes.

Mr. Elliott. Come around, Dr. Klim.

Dr. Klim, our time situation is such, with 40 witnesses today, that we will have to place a limitation of 10 minutes on your statement. With that understanding, you may proceed, sir.

STATEMENT OF CHARLES J. KLIM, ASSISTANT PROFESSOR, SPEECH PATHOLOGY, EMERSON COLLEGE. BOSTON. MASS.

Mr. Klim. This will average seven, perhaps.

Emerson College in Boston was one of the first college units in the country to train students as speech teachers, speech pathologists, and audiologists.

It has its own speech and hearing clinic where students receive the training and supervised practice as a necessary part of their prepara-

tion for certification in the field of speech and hearing.

At the present time there are 135 children and adults seen weekly at this clinic. Lack of physical space and staff limit our services. We

want to expand this facility for the public.

The college also provides part-time speech and hearing help for the industrial school for crippled children in Boston, Tufts University Cleft Palate Clinic, Sullivan Square Medical Center, Holy Ghost Hospital in Cambridge, Woburn Public Schools, and Boston Dispensary which serves the New England Medical Center as a whole.

These programs exhaust the time of our present staff. We are appealed to regularly to survey school systems for need in speech and hearing. We do what we can, but have to turn down appeals for

help due to lack of staff and equipment.

Easter Seal Club, cerebral palsy groups, and medical clinics continually ask for speech and hearing service from us. We do not have the

help to offer help in speech and hearing.

Even New Hampshire clinics call on us regularly for service. In order to keep up the high standard of training for our undergraduate students in speech and hearing and to keep our clinic adequately supervised, our graduate program in speech and hearing has been slow in advancing.

We are being pushed to offer more to graduate students who want to receive higher certification. We need and want to meet this demand.

We now lack the space and staff to expand. With additional funds we could provide immediately the staff and the equipment necessary

for the people who will want advanced training.

Our college clinic has a waiting list for people who need speech and hearing therapy. Expansion of our graduate program would mean increased therapy service to the community. It would mean a place where more bachelor degree students could obtain advance training. It would mean also that many students of speech and hearing would stay in the Boston and New England area to obtain their training instead of leaving for outside of New England and there to study and eventually settle.

The theory is that if they study in New England, they may stay there. With the excellent training facilities connected with the college in regard to speech and hearing, the opportunities for research are excellent. We have not been able to study and to evaluate the many therapy techniques or ideas which may have clinical value; it

may be because of our lack of funds to provide the staff.

We do have the cases. If we had adequate funds we could put to immediate use two more advanced certified people on our staff on speech. We could use another full-time person in hearing if we had funds

Our facilities are now inadequate. We need soundproof rooms for We need to double our space in order to better serve our speech therapy clients.

We need to provide more in the way of parent education. We have been requested time and again to provide therapy for adult cerebral

palsy groups and other adult groups.

We have been called upon to help guide the more rural areas of northern New England especially in regard to setting up programs to

meet the speech and hearing needs of smaller communities.

These are critical needs. With money and staff we could do much more to provide initial guidance and survey then we are now able to

Two years ago Emerson College conducted a workshop in the speech and hearing needs of rural areas in New England. The gathering of people who attended to testify as to the specific needs in their communities revoiced what was generally known. They were unanimous in voicing a need for education of parents in the areas as regards speech and hearing and a critical need for diagnostic evaluation by qualified therapists and a drastic need for qualified therapists to provide regular therapy in the rural areas.

Today the need in these areas is just as great and just as critical as

2 years ago.

The colleges in New England need funds to provide the increased staff and to recruit students who could fill some of these needs upon graduation.

The students who graduate from our college have no difficulty gaining employment. The number of positions far exceeds the number of

graduates who have been turned out annually.

This picture will continue in spite of increase in graduates.

My own introductory course in speech and hearing this semester has 62 students enrolled. These are potential therapists. This is

our largest single class.

We hope this kind of increase will continue. Nearly half of these at this early point in training have voiced a desire to go into graduate training in speech and hearing. They are faced with a real problem of finance on the graduate level. The expense of undergraduate training alone today is all that most parents can afford. This is where most parents stop.

In order to go to graduate school the student must support him-This is difficult. To encourage them we need fellowships, traineeships, and grants for some years to come to help them continue their studies. Federal grants would be most welcome.

are now and will be desperately needed in New England.

Thank you.

Mr. Elliott. Thank you very much, Dr. Klim.

Are there any questions of Dr. Klim.

Thank you, Doctor. Our next witness is Mr. L. P. Simons. Is Mr. Simons here? Mr. Simons, I regret that it is necessary that we impose time limitation of 10 minutes.

Mr. Simons. That is all right. Most of the material I will present is in the document you have. I will abstract it.

Mr. Elliott. Without objection, the complete statement of Dr. L. P. Simons will be made a part of the record, following his oral presentation.

You may proceed, Mr. Simons.

STATEMENT OF L. P. SIMONS, EXECUTIVE DIRECTOR, EPILEPSY INFORMATION CENTER. BOSTON. MASS.

Mr. Simons. Thank you.

Of the 1,500,000 epileptics in the United States fully 80 percent have seizures eliminated or reduced to a minimum. Translated in terms of employment this means that 80 percent properly can be employed in competitive industry.

Unfortunately, being able to work does not mean the epileptic can find a job. There are many industries that will not hire an epileptic even if completely controlled, let alone employ him if attacks occur

as frequently as once a year.

The employers offer the following reasons as to why they cannot hire an epileptic:

One, that he has a high enough accident rate.

Two, that his workman's compensation rates automatically rise when an epileptic is employed.

Three, epileptics have a high absentee rate.

Experience has demonstrated, both through research and on-thejob experience, that this just is not true.

For example, in 1958, the Ford Motor Co. in Dearborn, Mich., re-

ported not one accident out of 165 workers with epilepsy.

In 1951, the U.S. Department of Labor study demonstrated there is no significant difference between the disabling and nondisabling accident rate of epileptic and nonlinearing workers.

The workman's compensation board in New York found that the average number of closed cases involving epileptics was only 10 out

of 100,000.

It would not seem that people with epilepsy are particularly acci-

dent prone

As far as workman's compensation rates, rates are based on experience rather than whether handicapped people are employed?

It was found also in 1951, the U.S. Department of Labor study, that epileptics actually lost less time because of accident than the nonimpaired worker.

The problem of the epileptic in industry seems to be primarily that

of education. We know that the epileptic can work. They find it

difficult to get a job.

I would like to propose a three-point program that the Federal Government do undertake to show leadership in getting epileptics back to work.

The first point is education. Since our attitude bars the epileptic from employment I recommend that the Federal Government provide funds for an epileptic education program and program developed in the following manner:

One, that the Secretary of Health, Education, and Welfare call an epileptic-in-industry conference by industrial leaders, that this conference be expanded to the State level and that this Government pro-

vide funds through the State offices of rehabilitation for the education of business leaders regarding the employability of epileptics.

Two, Workman's Compensation

Three, improving vocational rehabilitation techniques. Most people with epilepsy who require rehabilitation and placement are referred to their local office of vocational rehabilitation.

Thank you very much.

Mr. Elliott. Thank you, Mr. Simons. (The formal statement of Mr. Simons follows:)

STATEMENT OF L. P. SIMONS, EXECUTIVE DIRECTOR, EPILEPSY CENTER, BOSTON, MASS.

Yesterday this committee heard Mrs. Albert Grass, president of the American Epilepsy Federation, discuss the problems of the epileptic child in school.

Today, I would like to discuss the epileptic in relation to employment.

Of the 1½ million epileptics in the United States, fully 80 percent can have their seizures eliminated or reduced to a minimut. Translated into terms of employment, this means that 80 percent, or over 1 million epileptics, properly placed, can be employed in competitive industry.

This is not to imply that a great many of the 15-percent group of epileptics who are not so well controlled cannot work, but, rather, that the 80 percent

segment should present no problem to industry at all.

Unfortunately, being able to work does not mean that the epileptic can find a job. There are many industries that will not hire an epileptic even if he is completely controlled, let alone employ him if his attacks occur as infrequently as once or twice a year.

Loyalty to tried and trusted employees goes out the window when epilepsy

is involved.

For example, we have the case of a man who was employed by a large insurance company for 7 years and was summarily fired when the company learned that he had had a seizure at home. The seizure resulted simply because the fellow had run out of medication.

Why does industry object to employing the epileptic? Employers offer the following reasons as to why they cannot hire epileptics:

The epileptic has a high industrial accident rate.

2. Workmen's compensation rates automatically rise when an epileptic is employed.

Epileptics have a high absentee rate.

4. Epileptics can perform very few jobs.

Other employees object to working with an epileptic.

Let us look at these objections and see how they stand up in the light of documented data.

Do epileptics have more industrial accidents than the nonimpaired worker? As of 1958, according to the safety director of the Ford Motor Co. plant in Dearborn, Mich., there was not one accident worth noting, out of 165 workers, with epilepsy. Of course, seizures occurred, but they did not result in accidents.

A study by the U.S. Departmeent of Labor in 1951 demonstrated that there is no significant difference between the disabling and nondisabling accident

rate of epileptics and nonimpaired workers.

The Workmen's Compensation Board of the State of New York found that in the 8-year period, 1945-52, the average number of closed cases involving epileptics was only 10 out of 100,000.

In view of these facts it is evident that the epileptic worker is not an industrial accident risk. The attitude that he is, as held by industry, is completely without foundation.

Do workman's compensation rates automatically rise when an epileptic is hired?

In 1954, the Association of Casualty & Surety Cos. issued the following statement as regards workmen's compensation rates:

"Insurance rates are based on accidents involved in operation and the company's accident experience. No consideration is given whatsoever to the question of whether or not handicapped workers are employed."

Here again we can see that misinformation is hurting the epileptic in his search for employment.

Do epileptics have a higher absentee rate than the nonimpaired worker.

The 1951 U.S. Department of Labor study uncovered the interesting fact that the epileptic actually loses less time because of accidents than does the nonimpaired worker.

Further, the study showed that the work attendance records of epileptics were the same as for those on the nonimpaired worker.

Again, we have another meanlingless argument.

Are epileptics limited as to the jobs that they can perform?

According to the pamphlet, "Patterns of Disease," published by Parke, Davis & Co. in 1958, epileptics were holding jobs in the following areas:

"Professional, business, and college students, 27 percent; clerical and skilled workers, 28 percent; sales and service workers, 20 percent; unskilled laborers, 25 percent."

From these statistics it can be seen that epileptics can handle jobs in every

field of endeavor.

Do people object to working in close proximity to an epileptic?

Unfortunately, in some instances this is true, but it is not irrevocable. The Epilepsy Information Center, has found that this problem can be solved when an employer will take time to interpret epilepsy to his employees.

The facts that I have just presented show conclusively that there is no valid reason why an epileptic who is completely or relatively free of attacks cannot

be placed in competitive industry.

Further, the data indicates that the underlying reason the epileptic has difficulty with employment is not due to his physical condition, but, rather, due to the erroneous attitudes of industry toward him.

We cannot afford to allow these attitudes to continue indefinitely. Such attitudes are degrading and rob people with epilepsy of their dignity, they are causing a pool of potentially productive workers to be untapped.

From an economic point of view it is costing the taxpayers of this country a lot of money to support a group of people who are not working because of

facts that were valid 100 years ago.

Since returning the epileptic to gainful employment is a national problem, I believe the Federal Government should become more active in this area. would like to propose a three-point program which, if adopted by the Federal Government, would lead the way to acceptance of the epileptic by industry:

1. Education

Since outdated attitudes are barring the epileptic from employment, I would recommend that the Federal Government provide funds for an epileptic-inindustry educational program, and that the program be developed in the following manner:

A. That the Secretary of Health, Education, and Welfare call an epileptic-in-industry conference composed of industrial leaders throughout the

Nation.

B. That this conference be expanded to the State level. C. That the Federal Government provide funds through the State offices of vocational rehabilitation for the education of business leaders as regards the employability of epileptics.

2. Improving vocational rehabilitation techniques

Most people with epilepsy who require rehabilitation and placement are referred to their local office of vocational rehabilitation.

Unfortunately, because these units have large caseloads, and because of the difficulties in placement the epileptic is often overlooked or written off as not

being suitable for rehabilitation.

To remedy this situation, I would recommend that the offices of vocational rehabilitation located in large urban centers establish within their organizations a division of epileptic services for a 5-year period. This special service devoted solely to epileptics would have its own counselor, social worker, and placement

By establishing a division of epileptic services, I believe the following would be accomplished:

1. Rehabilitation services would be available to a more diversified group of epileptics.

2. A fund of knowledge about the employability of epileptics would be built up.

3. A concentrated effort to breaddown employer resistance to the epileptic

would result.

4. Realistic standards for the employability of epileptics would be

established.

Although there is a certain amount of resistance to establishing special services for special groups, I believe that the problems of the epileptic are so complicated that at least for a trial period of 5 years a program offering the epileptic specialized employment services is required.

3. Prevocational counseling

If the handicapped child is to develop into an economically productive adult he must have expert prevocational counseling by people who are familiar with the requirements of industry in this regard.

Also, the handicapped child must have counseling very early in his academic

career.

I would, therefore, recommend that the Federal Government make additional funds available through the local offices of vocational rehabilitation for prevocational counseling of handicapped children and that this counseling be offered at the junior high school level.

In closing, I would like to say that money spent by the Federal Government in returning people to work comes back to the Government in the form of increased

tax revenue

I can think of no better source of new tax money than the 6 million handicapped people in America.

Mr. Elliott. Our next witness is Mr. Oscar K. Weiner.

Is Mr. Weiner here.

Our next witness is Miss Frances Tappan.

Is Miss Tappan here.

Miss Tappan is the technical director of the School of Physical Therapy at the University of Connecticut.

STATEMENT OF FRANCES TAPPAN, TECHNICAL DIRECTOR, SCHOOL OF PHYSICAL THERAPY, UNIVERSITY OF CONNECTICUT

Miss Tappan. In the interest of gaining your complete attention, I

have made my statement very short.

The Connecticut Chapter of the American Physical Therapy Association has asked me to speak to you concerning the educational aspects and in particular connection with the bill H.R. 3465 which is concerned with the most expedient rehabilitation of handicapped individuals.

Obviously, this care depends directly on the number and quality of therapists who can be educated to assume the immediate responsibility

for this rehabilitation.

It is my particular responsibility as an educator to see that this education leads ultimately to the best possible method of physical

rehabilitation.

Numbers at this point do not concern me as much as the quality of the therapists which we can graduate in our various schools. This quality depends directly upon the contemporary tools which are available for teaching purposes.

I am particularly concerned to find that, according to rehabilitation and training memo No. 60-5E, Department of Health, Education, and Welfare, under priorities for support places the specific project for

development of teaching materials as its fourth priority.

The value of the three priorities which precede this cannot be denied for while it is indeed important to expand existing curriculums, encourage graduate study, and encourage specifically graduate education in physical therapy, it is even more important as I see it, to provide up-to-date, clear, and concise visual aids such as motion pictures, slides, charts, models, and printed materials to assure the fact that the therapists we do graduate are all well prepared to render the best patient care possible.

Other organizations and associations are doing a magnifificent job with scholarships for these students, but there is also almost no other source other than the Office of Vocational Rehabilitation that will

give us needed help to provide teaching materials.

I have made this point briefly and I hope strongly.

Anything you can do to strengthen this aspect of the program would, I am sure, contribute to physical therapy education throughout the country.

Thank you very much.

Mr. ELLIOTT, Thank you very much, Miss Tappan, for your testimony.

You have made a good point and have made it well.

Miss Tappan. Thank you.

Mr. Elliott. Are there any questions.

Thank you, Miss Tappan.

Miss Tappan. Thank you Mr. Chairman. Mr. Elliott. Is Mr. Arthur L. DuBrow here?

Is Dr. Robcliff V. Jones here?

Mr. Jones. Yes, sir.

Mr. Elliott. Mr. Jones is an associate in physical medicine and . rehabilitation, assistant professor of medicine of Yale University. We regret that we must impose a 10-minute limitation on you.

STATEMENT OF ROBCLIFF V. JONES, ASSOCIATE IN PHYSICAL MEDICINE AND REHABILITATION, ASSISTANT PROFESSOR OF MEDICINE, YALE UNIVERSITY

Dr. Jones. Rather than go over every point of the prepared statement I have, I would just like to bring out some major points.

Mr. Elliott. After Dr. Jones has summarized her report, then the

report will be made a part of the record, without objection.

Dr. Jones. First of all, I would like to express the appreciation of myself and all of us who are testifying here today and who were at the workshop in the last 2 days.

In regard to the needs for the New England area in rehabilitation, in special education, I think this will come out adequately from the

workshop report that you will hear.

Inasmuch as we are concerned with individuals who have physical and mental handicaps and physical and mental impairments, we are concerned with individuals having specific medical problems.

Because of this, we are working with patients; and I think it is very important that we have adequate mental direction, supervision, and guidance in the planning of such legislation and in the implementation of this.

Now, as to where the facilities would be set up, or increased, I think this should be in no way limited to any particular group or place. But I do think that where it is possible we should use facilities having to

do with medical schools.

The reason for this is that it would enable us to draw on a pool for future workers in the field, from young medical doctors and allied workers in the coprofessions that work in the medical centers, but I would like to repeat that this in no way means I feel this should be limited to any area like this, but it should be given consideration.

In regard to the independent living bills, 1119 and 3465, I think the goals of these are admirable and I am in entire accord with them.

One of the things that concerns me—and this in no way is a criticism of the bill; it is something that I think we should try to keep in mind when it comes to implement this—is that at present one of the major tests of successful rehabilitation is how many of the individuals that

are working on this program are placed in a job.

Now, this extends the area of individuals being helped to a much larger group. I am apprehensive lest, say, the vocational counselor, who now has a larger number of patients to work with and individuals to work with, may not apply himself as vigorously toward the ones that are potentially employable.

I am merely transferring on to the vocational counselor what I have

to do when I have a lot of work to do.

I try to cover it all and it is very difficult to make this final step, getting a job for the patient.

Mr. Daniels. What do you recommend in this case?

Dr. Jones. All I can say is that this should be kept in consideration in every vocational counsellor's mind when he is working with them if it turns out the vocational counsellor will be the one utilized in carrying out this purpose.

Mr. Daniels. Do you approve the idea of independent living under

that bill?

Dr. Jones. I am sorry?

Mr. Daniels. I say, do you approve the principle of developing the idea of independent living?

Dr. Jones. I certainly do. I am all for it.

But I think we should be careful not to fall into the pitfall that I

can see occurring which I have just described.

In regard to specific points in the bills, I am a little apprehensive about having this all under one agency. I think this probably is necessary to make sure that we have an efficient program, but I am apprehensive that some of the very good groups that have a lot to offer might not be utilized as adequately as if this were dispersed through numerous areas.

I do not know the answer to this administrative problem.

Another point that concerns me some, and I must admit that I do not understand the wording on these particular parts adequately, is that in giving out the funds, say four times a year, if it comes out to be this, or twice a year, if there is some way that we could avoid the situation where, say, in June money may run out and patients have to wait until December before they can be taken on a program and then in December there is a lot of money, relatively a lot of money available, and suddenly everyone is looking for patients to utilize this.

I don't know whether this is a reflection of planning for future

funds for the following year, or not.

I do not know how to overcome this, but I think it is something that should be taken into consideration so that we have a continuing amount of money without feast and famine, so to speak.

Those are the main points I would like to make, sir.

Mr. Elliott. Thank you very much, Dr. Jones.

Did Mr. DuBrow come in?
Mr. DuBrow. Yes, sir.

Mr. Elliott. Will you come around, please, Mr. DuBrow.

Mr. DuBrow is present of the Connecticut Rehabilitation Association.

I am sorry to say to you, Mr. DuBrow, we have to impose a limitation of 10 minutes.

Mr. DuBrow. I don't think I will take that long, sir.

Mr. Elliott. You may proceed.

STATEMENT OF ARTHUR L. DUBROW, PRESIDENT, CONNECTICUT REHABILITATION ASSOCIATION

Mr. DuBrow. I would like to apologize for being late. I was informed by some people who participated yesterday that there was no need for me to rush since you were running pretty late yesterday. I took that as gospel.

Mr. Elliott. We have speeded up a bit today.

Mr. DvBrow. The Connecticut Rehabilitation Association which I represent has a membership of well over 300 people in the State of Connecticut comprising both professional workers in the field of health, education, and welfare, and also numerous private citizens from all walks of life who are interested in and concerned with the problems of the handicapped.

The association has three points which we would like to present our

viewpoints on.

The first of these is that we are a chapter in NRA as you well know, and we would like to go on record as definitely endorsing in principle

the proposed legislation for independent living services.

However, the Connecticut association is concerned with some of the restrictive elements of the legislation in terms of proposing to make these services available to only two categories of handicapped people, those in institutions and those who are able to afford the luxury of an attendant.

From figures which we have been able to compile from the Connecticut State Department of Welfare, the Connecticut Bureau of Vocational Rehabilitation, and the Connecticut Society for Crippled Children and Adults, it looks as though there are something between 8,000 and 10,000 people in the State who are seriously disabled, who could profit from this kind of service, but who do not fall into these two categories of being in an institution or having and attendant.

Now, this number, of course, is being added to daily in terms of

accident toll and illness and so on.

So this becomes a significant number of people for whom rehabilitation services on the State or Federal level are not available. We are concerned about the possibility of providing some sort of

service for this group of people.

The second point has to do with the acknowledged shortage of rehabilitation facilities. I think it is pretty well documented that nationwise there does exist a shortage of rehabilitation facilities.

However, the association feels it should be recognized that this situation does not pertain in all parts of the country and there are areas in the country where there are adequate rehabilitation facilities.

It should be noted that these rehabilitation facilities in many cases are not being utilized to their fullest maximum. The proposed legislation holds out the hope that Federal money will be available for building new facilities and for adding to existing facilities, and it is the association's hope that if the legislation is approved, in whatever form it may be, and that Federal money does become available that somebody take a good, long, hard look at the area where the money is going in terms of what the rehabilitation facilities are there and how much use is being made of these facilities before new Federal money is made available for construction of additional facilities.

I think this was our second concern.

The third point that we wanted to make concerned also the shortage, this time in the area of trained personnel. We feel that a good start has been made toward meeting the needs of shortages in terms of rehabilitation counsellors through the present programs in the var-

ious colleges and universities.

However, more and more of the other disciplines are becoming involved in the work of rehabilitation and it would be the association's hope that some provision be made for encouragement, scholarships, training for allied disciplines in terms of medical social workers, psychiatric social workers, psychologists, and other professionals who might be encouraged to enter into the field of rehabilitation and whose services are very badly needed and who are in very short supply.

These are the three major points which the association wanted to present and on behalf of the association I would like to thank the committee for the opportunity of presenting these viewpoints.

Thank your very much.

Thank you, Mr. DuBrow. Mr. Elliott.

Without objection, the the witness' statement will be made a part of the record immediately following the gentleman's oral statement.

Mr. DuBrow. Thank you.

(The statement referred to follows:)

STATEMENT SUBMITTED BY ARTHUR L. DUBROW, PRESIDENT, CONNECTICUT REHABILITATION ASSOCIATION

The Connecticut Rehabilitation Association, which I represent, comprises a membership of more than 300 people in the State of Connecticut. bers are both professional workers in the fields of health, education, and welfare, and also private citizens from all walks of life who are interested and

concerned with the problems of the handicapped.

The Connecticut Rehabilitation Association would like to go on record as heartily endorsing the proposed legislation to provide independent living services. However, the association is concerned with the restrictive elements of this legislation which proposes to make these services available only to those individuals in institutions or to those who have an attendant present. From figures compiled from the State dept. of welfare, the State bureau of rehabilita-tion, and the Connecticut Society for Crippled Children and Adults, it would

appear that there are between 8,000 and 10,000 disabled persons in this State who do not fall into either of these two categories. These disabled individuals who are not in instutions and who do not have an attendant are just as much in need of independent living services as the two groups specified in the proposed legislation. The daily toll of accidents and disease is constantly adding

large numbers to this latter group.

It has been well documented, that nationwide, there is a shortage of rehabilitation facilities. However, the association feels that it should be recognized, that in many parts of the country, adequate rehabilitation facilities do exist. It should be likewise recognized that many of these existing facilities are not being utilized to their fullest capacity. Therefore, the association would like to recommend that, before Federal funds are made available to any area for the addition of or the construction of new rehabilitation facilities, steps be taken to insure the fullest use of existing facilities and a request for Federal funds intended for new facilities be fully justified and substantiated.

The Connecticut Rehabilitation Association is also concerned with shortages in the area of trained personnel. It is felt that excellent progress is being made in terms of meeting the needs where rehabilitation counselors are concerned. However, it is now evident that other disciplines are becoming more involved in the process of rehabilitation and the association feels that some provisions should be made for assistance to prospective medical social workers, psychiatric social workers, psychologists, and other professional workers who are willing and

anxious to devote their efforts in the field of rehabilitation.

On behalf of the association, I would like to thank the committee for the oppor-

tunity of presenting the viewpoints of the organization.

Mr. Elliott. Has Mr. Oscar Weiner come in yet?

I notice that Mr. Stanley Myers is here. He is scheduled to testify in behalf of the Parents and Friends of the Mentally Retarded Children of Bridgeport, Conn.

Mr. Myers, will you come around and give us the benefit of your

testimony?

We are very happy to have you, sir.

STATEMENT OF STANLEY MYERS, ON BEHALF OF PARENTS AND FRIENDS OF MENTALLY RETARDED CHILDREN, BRIDGEPORT, CONN.

Mr. Myers. It is a pleasure to be here, sir.

Honorable Chairman, ladies and gentlemen, members of the committee, in 1956 a station wagon stopped at the house of a 24-year-old girl. There is nothing different about this normally; this happens every day in our lives where handsome young men stop at 24-year-old girls' homes and take them out dancing, dining, and to the movies.

Unfortunately, in this case we have a little different situation. This 24-year-old girl was being taken out for the first time in her life by another man. She had never been out of the house before in the company of anyone else other than her mother or her father, or probably both.

She could not walk. She could not talk. She could not go to the

bathroom by herself. She could not feed herself.

But for the first time in her life she was leaving a home to go to

"school."

I must put the school in quotes. This girl was picked up by a driver and carried to a station wagon and placed in that station wagon and taken to a center in Bridgeport and cared for there for a period of a short 31/2 hours.

For the first time in 24 years this girl smiled at someone alse. For the first time in the family's life they had an opportunity to go out together without worrying whether the child was adequately cared for. I cannot measure this in terms of money or in terms of material benefits to anyone. I can only measure it in terms of what it means to a family to have hope and something for a child who is presently remaining at home.

Now, granted you can say, "Why should not this adult be placed

in an institution?"

We don't have the right to make that decision. This remains with the parent to make this decision. But at the same time, even if this 24-year-old girl was to be institutionalized in our State alone because she is mentally retarded, there would be a 3- to 5-year waiting period. During that period must we deny this individual an opportunity

to progress?

When I am asked why you keep bringing this child in, why don't you force these parents into institutionalizing this child, I can only give one answer: "She smiles," and for this reason every penny that

is spent on this child is worth it.

The same thing applies to a 7-year-old or a 9-year-old who is inadmissible to public school training because they are mentally retarded. There is a bill presently before the Congress and I probably am getting off the point here, but a parent in Norwork comes to me and says, "I came to this country from Hungary, out of Austria. All my family was admitted to this country except my 13-year-old mongoloid boy who cannot come because he is mentally retarded."

This has been the history of the problem of the retarded for practically forever. The problem now faces us, I think, and we as society

must face this problem and examine our own conscience.

Toward this end the Parents and Friends of Mentally Retarded Children of Bridgeport, a parent-sponsored organization, has endeavored to create services for the retarded children and adults in the community, where the problem, we feel, must be met in the eventual final analysis.

Toward this end we feel that the Federal Government can stimulate the local organizations, the State organizations, who can benefit these individuals, can stimulate them in helping to meet the needs of these individuals. To this end we feel that a number of things could

be done.

No. 1, we feel that there is to our knewledge no specialist in the field of mental retardation on a national level. The Office of Vocational Rehabilitation, which takes a great interest in this problem, does not have anyone specifically delegated to the problem of the retarded.

The States do not have anyone specifically delegated to the problem of the retarded. Direct grants to workshops have been provided. We feel they should be extended on teaching grants which should be granted for purposes of providing services we feel are needed of the specialists in vocational placement for retarded should be provided.

In the Office of Vocational Rehabilitation in the U.S. Employment Service areas; added services in vocational rehabilitation in State

training schools should be provided.

Through the Federal Government we feel that the vocational educational of the retarded should be investigated and expanded in the direct grants to State trade schools.

School work programs are being investigated now where adults go to school for a 3-hour period and work for a 3-hour period. These

should be further investigated.

Grants for subtrainable adults in sheltered workshops: We know what the cannot do generally. We are not so sure as to what they

can do. This, we feel we must find out.

In the area of special education, preparation of teachers for subtrainable children, children who have been diagnosed as mentally retarded by one individual or perhaps by other individuals, and perhaps there is a misdiagnosis—perhaps we should look into this more closely so that the subtrainable, as he is so classified, is not stigmatized for the rest of his life as a subtrainer without opportunity to improve the capacity that he presently has.

Research into some more effective teaching of teachers; speech training for retarded: At present it is most difficult to get speech education for mentally retarded children presently participating in

public school programs.

Grants for competent clinical psychologist and social workers in public school systems, with medical consultants available all for the

purpose of differential diagnosis.

The possibility of reimbursement grants for recreational programs for school-age children. Staff personnel in the Federal Government in education for correlation and standardization of days and curriculum for training.

Grants to personnel in State offices of education to work more

closely with local boards of education.

There are many problems that exist in this field and many areas which we can investigate for purposes of benefitting a tremendous segment of the population which formerly has had little concern expressed over the needs and the desires of these individuals.

I appreciate being here. Thank you for the opportunity.

Mr. Elliott. Thank you, Mr. Myers.

Mr. Giaimo. Mr. Myers, is part of this difficulty in the field of mental retardation in our State the fact that we have waiting lists in our training schools and so forth, the fact that there is not a suffi-

cient amount of public awareness or concern?

Mr. Myers. As you probably know, the last Legislature of the State of Connecticut has recognized the problem and passed a series of bills which we trust will make the public more aware of the problem, as well as provide services to the retarded, and we feel on a community level. Although there is a waiting list of 3 to 5 years in the State training schools, I am of the personal opinion would never be able to build the State schools to house the potential number.

As an example, last year the number of live births in the Greater New Haven area—Bridgeport, Derby, Milford—there were 15,000 live births. If we estimate conservatively 1 percent of the population being mentally retarded, that gives you an indication of just the number we must care for as of last year. Compounding that with this year's births, this gives you an idea of the potential we must recognize.

Mr. Giaimo. The difficulty I see in this whole field of mental retardation is that there seems to be a shortage of facilities, funds, and training personnel; is that not true?

Mr. Myers. Yes.

Mr. Giaimo. Is that not the reason for this primarily, the fact that until there is sufficient public recognition of this problem so that then the States and local governments and perhaps the Federal Government will become aware of it, until such time it is very questionable whether we are going to get the trained personnel and facilities?

we are going to get the trained personnel and facilities?

Mr. Myers. This is ture, but we feel there is another problem involved, too. We must not only get the public aware of the problem, we must get the parent aware of the problem, the professional

aware of the problem.

We have heard for a number of years that we do not have sufficient teachers in the field of mental retardation. We also do not have

sufficient classes in the field of mental retardation.

This is a vicious circle which will never end. If you don't have the classroom you will never find the teacher. If you don't have the teacher you will never get the classroom.

It is true, we need a great deal more public awareness of the problem. At the same time, unless the start is made, we can never make

the public aware of what the need is.

If I may extend this just one moment, I personally feel that if we are in a position to start small, which has happened in the State of Connecticut, we then can build from that point. But if we are not in a position to start at all, it is a question as to whether we will ever start.

Mr. Giaimo. One of the questions that will be thrown at this committee in Congress at such time any recommendation will be made to furnish assistance to mental retardation, one of the first questions will be thrown at us as to why do not the States do more about it? What is the answer to that?

Mr. Myers. Let me put it this way: I will put it on a local level. You gentlemen were kind enough to visit a center yesterday that started on a local level without one penny's aid from the Federal Government, or from the State government. It was all done through community awareness of the problem, community support of the

problem.

If we can present the problem to the community in such a way as to inform them of the need, if we can eventually find a number of children whom we suspect are mentally retarded, the State of Connecticut conducted an investigation in 1957 where they estimate that there are approximately 40,000 known mentally retarded children and adults in the State of Connecticut alone. It is projected to about 2 percent of the population.

These are known figures. So the problem has to be brought out

into the open, No. 1.

No. 2, once it is brought out in the open, if we don't meet it at that level, then we are back to where we started from.

Mr. GIAIMO. Thank you.

Mr. Daniels. Mr. Myers, what do you estimate the mentally

retarded population of the United States to be?

Mr. Myers. The national statistics claim 3 percent of the population is mentally retarded. Our own feeling is that if this is true,

roughly 2 percent of the population is retarded, who will need some assistance in supervision as far as living in a community is concerned.

One percent is that borderline level that perhaps we will never get to see. They get jobs and adjust to the community and move in the

regular society.

Mr. Daniels. As I have been listening to the witnesses that have been testifying here, we have a pretty sick Nation, 10 million disabled housewives, 8 million speech and hearing defectives, 11/2 million epileptics.

You just gave me a figure of 5 million mentally retarded. This is

only part of the field.

Mr. Myers. It is a matter of degree, if I may say so, Congressman. No. 1, the individuals about whom you are speaking are individuals who perhaps can be cured or who perhaps can subsist on a normal level.

We are talking about a segment of the population who will never be cured. We have so little research in the area to find the reasons. Presently today we know approximately 77 different reasons for mental retardation. I can quote you four which have been investigated recently that we think we can control.

We don't know yet, because it is so recent we don't have enough

proof to say it can be controlled.

So the area of research has to be looked into more fully.

Mr. Daniels. With such an alarming number of people who are ailing in one manner or form or another, do you think there would be a greater awareness of the problem nationally and that something would have been done about it prior to this date-

Mr. Myers. I would think so, but I have never been able to figure .

out why it has not happened.

Mr. Daniels. Fortunately, our committee under the chairmanship of Mr. Elliott, is endeavoring to do something about it. Mr. Myers. Thank you.

Mr. Elliott. Thank you very much, Mr. Myers.

Now, has Mr. Weiner arrived yet?

Mr. Weiner, we have restricted our witness today to 10 minutes. If you have a longer statement than that and you want to summarize it, I am happy to say to you that the complete statement will be made a part of the record.

You may proceed, in view of that limitation, in any manner you

care to.

STATEMENT OF OSCAR D. WEINER, EXECUTIVE DIRECTOR, CHILDREN'S CENTER, HAMDEN, CONN.

Mr. Weiner. I am representing here the Children's Center which

is a private association located in Hamden.

I would like to speak from the point of view of opportunities through the rehabilitation acts that might be considered by the Federal Congress to augment the treatment and study of emotionally disturbed children who are residents at our institutions.

These children have not been able to meet the demands of living as a member of the family. We feel that at our agency we have the ability and the potential to structure treatment and to give appropriate services to these children except in the area of schooling which

has become increasingly difficult.

There are now 72 children in residence. Some of these may benefit by keeping their ties with the community, by attending public schools in New Haven.

However, it has been found by both the school faculty and by our staff that many of these children need special classroom services, preferably located at the institution where they can be more individually supervised by our teachers in small groups.

The incidence of school maladjustment as a major reason for referrals to our institution is increasing at an alarming rate.

Whereas 2 years ago about one-third of our referrals were children who had repeated major difficulties in public schools, now almost three-quarters of our

referrals emphasize this.

These children come to us after moving from one temporary home to another and from school to school, having had little opportunity to develop trusting relationships, confidence, incentive or skills so that they might achieve some learning.

Out of our 72 children we have 18 in 2 special classrooms at our institution. Both we and the very cooperative local public school people feel that this simple environment for a temporary period is absolutely necessary during the treatment of these children before they go into the more complex public school system and especially in the secondary schools where they must go from classroom to classroom, from teacher to teacher, without the benefit of constant and consistent supervision.

There are, in addition, 16 of our children who at this moment desperately

need special classroom help.

We and the public school authorities feel it is a pity that these children and many on our waiting list, cannot be provided with this special service.

It seems too vast a problem for the local board of education to handle.

However, it would appear to be of such benefit for agencies such as ours who have made a tremendous investigation, to meet these emotional problems to be able to complete our job by assistance in building up school facilities to meet the increasing educational and vocational problems referred to us.

We have evidence that the children who have been in these two specialized classrooms have profited from this experience. They have adapted to special classroom routines where they have been constantly observed and could not be

tempted to leave.

We have had boys who have openly defied and threatened to assault the various public school teachers who now have a chance to know one teacher and

through that relationship to develop trust.

Our two teachers have felt that in small classrooms they have been able to ferret out interests and talents in pretty inadequate students which the public schools do not have the time to do.

These children have gained enough confidence to try a little in other areas

where they have previously felt inadequate.

We have countless children in these classrooms who were at one point incapable of staying in public schools, but later were able to return to public schools and adjust.

Our children have had severe emotional problems and poor educational background and incentive before they came to us. Although we wholeheartedly endorse high standard vocational schools and services with the broad scope of academic as well as practical courses, we find also a very urgent unmet need for supplementary vocational services for those children who have been handicapped, but must go out in the community after 16 years of age and earn a living.

We would, therefore, like to see funds for vocational training pro-

vided for treatment institutions.

We endorse the development of independent living workshops or rehabilitation services for handicapped persons over 16 years of age, referred to in bills 1119 and 3465.

We would also hope that residential facilities may be considered as important for these youngsters so that they might serve those gains which they might receive from these rehabilitative services through

a situation which is both supportive and strengthening to them. Our urgent question is not the growing need of special vocational and educational services for emotionally handicapped children so vast that it is beyond the resources of the local board of education and perhaps beyond the State capacity to finance unless Federal assistance is available, perhaps through a matching formula, that encourages State and local communities to take initial steps with at least token investment of their funds.

In summary, we give testimony to the need for additional special classrooms for the emotionally handicapped to the end that study and treatment services be rounded out with proper treatment, geared in education.

Two, we give testimony to the need for vocational schools geared to the practical goal of preparing children with lesser academic competence to learn a trade which will enable them to become selfsupporting.

Three, we endorse independent living facilities for the handicapped with the suggestion that supportive group residences be provided in order to preserve the gains of these rehabilitative services.

Thank you very much.

Mr. Elliott. Thank you very much. Mr. Giaimo. May I ask one question?

Mr. Elliott. Mr. Giaimo.

Mr. Giaimo. Is your school supported by public or private funds?

Mr. Weiner. It is a private agency.

Mr. Giaimo. It gets no support from the State at all, does it?

Mr. Weiner. The support it gets from the State is through partial payment for board. In no case does any parent or State government through the State welfare department pay the full cost of care.

Mr. Giaimo. Thank you.

Mr. Elliott. Thank you, Mr. Weiner.

If none of our afternoon witnesses are here, we will adjourn until 1:30.

May I ask those of you who are here to cooperate with us in passing the word around to any possible witnesses that we are trying to finish by 4 o'clock this afternoon.

We have witnesses scheduled through 4:50, but if we can get word to those that we are speeding up our schedule a little bit, I think they will connerate with us

think they will cooperate with us.

(Thereupon, at 12:10 p.m., the subcommittee was recessed, to reconvene at 1:30 p.m., same day.)

AFTERNOON SESSION

The subcommittee reconvened at 1:30 p.m., upon the expiration of the recess.

Mr. Elliott. The subcommittee will be in order.

Somebody said that a "North wind doth blow and we shall have snow" and I am hoping that you will pardon me if I tell you I have in mind to seek the sunnier climes beginning about 4 o'clock.

First, I am going to recognize the Honorable Anthony C. Gelor-

mino, mayor of Torrington, Conn.

Mr. Gelormino, will you come around.

He tells me he can make his statement very short and he needs to be somewhere else very badly and we will recognize him at this time

STATEMENT OF HON. ANTHONY C. GELORMINO, MAYOR OF THE CITY OF TORRINGTON, CONN.

Mayor Gelormino. Thank you, Mr. Chairman.

Mr. Chairman, members of your committee, I would just like to go on record as being in favor of your legislative bills to help the

handicapped and unfortunate people of the country.

I would like to tell you just a little about Torrington. About a year and a half ago I appointed a committee on rehabilitation and aid to the handicapped. This committee consists of prime members of individual agencies, including State unemployment, our welfare department, directorate of health, and the various agencies which are doing their very best to aid the handicapped.

Also in the city of Torrington I do have a little bit of school, we call it a school, to help the exceptional children. They are primarily

mentally retarded children and also various handicaps.

We are going to place another teacher on that who is being specially

trained to conduct the courses in the school.

To date my committee on aid to the handicapped and rehabilitation is working very closely with the State rehabilitation centers. We have found in a survey recently that we have about 90 people

that are in dire need of such type services.

We also find that with the knowledge of the residents of our area that such a committee does exist, that many people are coming out of obscurity and people who have been tucked away in homes for many, many years are coming out and registering with the hopes that they may be able to be helped.

I am very happy to report that we have made some progress. We are doing everything we possibly can to help these unfortunate people.

I was rather amused and amazed this morning when one of your colleagues questioned one of the people here who gave testimony, that we have a real unhealthy country with the multiples of people who are afflicted.

I do feel that what you are attempting to do will certainly eliminate

a lot of that because there is certainly a lot of overlap.

Many of the different agencies have the same people on their records. I think there is mass duplication. That is the reason for my committee. We are a city with a population of just over 30,000 people. To date we have about half of 1 percent.

We are an industrial city. In addition to trying to rehabilitate and to aid these people, I have members of the committee, members of management and labor and chambers of commerce, so that we are also able after due evaluation and all the aid that can possibly be

given to make an attempt to find the handicapped person

I sincerely urge the Congress of the United States to give favorable consideration to enactment of the proper type of legislation which will assist the communities and the towns and the States and the entire

country.

We do need assistance. As yet we have not used tax dollars. If there is need for it I intend to budgetize a minimum amount and work from there, but I want to sincerely urge you to do everything you possibly can to get the proper legislation passed which will enable these unfortunate people to smile again and to live with dignity and independence and certainly to assist the domestic problems in their families so that they will not carry the cross alone.

My sincere thanks to all of you for the pleasure of being here and also my own personal congratulations to Congressman Giaimo for his effort to bring the committee here. I hope you will get enough evidence and information here to indicate that there is a dire need for

that type of legislation.

Thank you, sir.

Mr. Elliott. Thank you very much, Mayor Gelormino.

Now, Dr. Pasquale Confreda.

Dr. Confreda, we must limit you to not more than 10 minutes.

STATEMENT OF PASQUALE CONFREDA, PRESIDENT, PARENTS LEAGUE, RHODE ISLAND SCHOOL FOR DEAF, PROVIDENCE, R.I.

Mr. Confreda. Thank you for reminding me, but I think I can

speed up the time. I have about 3 minutes.

Mr. Chairman, members of the committee, as president of the Parents League of Rhode Island School for the Deaf, and father of six children, two of whom are deaf, I wish to approve the rec-

ommendations made to the committee.

I wish to commend highly the work of Senator Lister Hill in introducing into the Senate Joint Resolution 127 and Representative John E. Fogarty for his work on companion bill 488 introduced in the House, and to the others who have worked for this important cause.

The teachers that I have known who have taught are dedicated to their work and it is miraculous the result they obtain under such

difficult odds.

I am in favor of any grants-in-aid program to encourage more teachers to become speech and hearing therapists. The children in our country who are handicapped by deafness need the skill of specially trained teachers of the deaf to develop their ability.

We also need specially trained speech pathologists and audiologists

to help those with speech and hearing impairment.

I endorse on behalf of myself and the Parents League of Rhode Island School for the Deaf, which I am representing, anything which may further this goal.

Thank you for the invitation to appear and speak to you.

Mr. Elliott. Thank you very much, Dr. Confreda.

Is Mr. Victor Reis here?

Mr. Victor Reis is the chairman of the Rehabilitation Commission of Torrington, Conn.

Will you come forward, sir. You may proceed.

STATEMENT OF VICTOR REIS, CHAIRMAN, REHABILITATION COMMISSION OF TORRINGTON, CONN.

Mr. Reis. Thank you, Mr. Chairman.

I merely wish to state briefly that I would like to concur in the statement made by Mayor Gelormino so far as the city of Torrington

is concerned. He covered it very, very adequately.

I just want to add that there is definitely a need for special rehabilitation and education here in the State of Connecticut. I not only speak personally of my own personal experience. For 11 years I conducted the program for the Veterans' Administration concerning prosthetic and sensory aids. I am very well acquainted with the dire needs that are presently quite obvious.

And not to take up too much of your time, as Mayor Gelormino indicated, we in the city of Torrington are definitely making an attempt to do our share for the purpose of rehabilitating these individuals that are in dire need of this particular type of training.

I at least hope that when you do return to Washington that a special effort will be made to enact the proper type of legislation

which the entire country will be very proud of.

Thank you.

Mr. Elliott. Thank you very much, Mr. Reis.

Our next witness is Mrs. Douglas T. Wilson, president of the Rhode Island Congress of Parents and Teachers.

Mrs. Wilson, you have heard me speaking of the time limitations,

have you not.

Mrs. Wilson. I promise to abide by the rule.

STATEMENT OF MRS. DOUGLAS T. WILSON, PRESIDENT, RHODE ISLAND CONGRESS OF PARENTS AND TEACHERS

Mrs. Wilson. I am Mrs. Douglas T. Wilson, president of the

Rhode Island Congress of Parents and Teachers.

We welcome this opportunity to speak of some of the unmet needs in Rhode Island in the field of special education. The division of the State department of education that deals with special education is working constantly to improve these services in the public schools. However, throughout the work with the mentally and physically handicapped, and the gifted, there emerges a pattern of similar needs.

It is this pattern of unmet needs which the Rhode Island congress

wishes to bring to the attention of the subcommittee.

1. All teachers should be trained to recognize problems: For any child to receive the benefits of existing special education programs it is necessary that his individual needs be recognized. The classroom teacher if trained to spot symptoms of trouble, is the logical person to set the wheels in motion to secure for the child the help he needs.

This applies to poor eyesight, poor hearing, and emotional disturbances. All of these difficulties are much more successfully treated if

detected early. The child's education may proceed and he remains

a happy member of the community.

2. More teachers are needed in special education: Many more teachers are needed in all fields of special education. More teachers of the mentally retarded are needed. Some communities are having difficulty complying with the State law requiring instruction of the educable and trainable, because of the problem of transporting these children. If more teachers were available these communities might have smaller neighborhood classes nearer the homes of these children. Likewise more teachers are needed for children with partial vision.

There is need for more speech therapists in Rhode Island. It is estimated that the three thousand pupils assisted by speech therapy in the past year are only about half of those who need it, and there are undoubtedly many more whose need has not been recognized.

This past year about 14 school districts in Rhode Island have had some form of special program for gifted children. These communities are now beginning to feel the need for more teachers specially

trained in this field.

3. Early evaluation, treatment, and follow-up of problems: In most Rhode Island communities a social worker is called to go to the home only when a problem interferes with attendance in school or disrupts a class. By that time the problem is far advanced.

Along with the need for teachers who are trained to recognize problems some program is needed to work with the home, to help parents understand and be impressed with the need for early

treatment.

This points out a need for more school social workers. The role of such personnel in helping the child, the teachers, and his parents to understand his difficulty and to bring about changes necessary to correct the situation, should have more emphasis. The social worker's skill and experience can be valuable in assuring early treatment.

In the case of emotionally disturbed children, there is a need for follow-up care if the benefits derived from existing clinics are to be

permanent.

The clinic staff is unable to follow these children into the home and the community. Lack of funds to provide sufficient resources for getting and keeping these children under effective care creates additional problems for the school and the community. House Joint Resolution 488, training teachers of the deaf, and pathologists and audiologists.

Policy No. 4 of the legislation program of the National Congress of

Parents and Teachers states, in part:

Federal funds appropriated for education should be available for special programs for the education of handicapped children.

The Rhode Island Congress of Parents and Teachers favors the passage of House Joint Resolution No. 488.

There are at present 23 speech and hearing therapists working in the public schools in Rhode Island. It is estimated that a minimum

of 50 additional ones are needed.

There are at present no facilities in Rhode Island for training speech pathologists and audiologists. While it might be desirable to establish such a training center in Rhode Island, we are aware that large expenditures for an extensive faculty and teaching equipment would be required.

If facilities in nearby States are not being used to capacity, our needs may be filled by encouraging enrollment of more Rhode Island

residents in these centers.

If this bill passes, it is hoped that the existence of the fellowships that will be established will be widely publicized so that Rhode Island residents might hear of them and apply. Regarding H.R. 1119 and 3465, The Rhode Island Congress of Parents and Teachers favors H.R. 1119, independent living. In so doing, we are furthering the action program of the National Congress of Parents and Teachers which is concerned with the prevention.

In this case it is the prevention of institutional care for those handicapped persons who may be restored to independent living.

The Rhode Island congress favors the provision of this bill which removes the restriction that a person must be progressing to employability before the vocational rehabilitation program can be applied.

Progress of an individual as far as becoming self-sufficient at home and thus able to stay out of an institution is in itself desirable. And

this is economically sound.

In Rhode Island we are in the midst of a \$10 million expansion program at the Ladd School for retarded children. It is estimated that unless we can help the adult mentally and physically handicapped to independence we will be faced with the expenditure of another \$20 to \$30 million for institutions for their care.

Further, it may well be that the workshop plan as a preemployment experience will assist many more handicapped persons to progress to

employability than at present.

Thank you again for this invitation to present our views here.

Mr. Elliott. Thank you very much, Mrs. Wilson for a very fine statement.

Is Dr. Josephine Rathbone here.

Miss Rathbone. Yes, sir.

Mr. Elliott. Dr. Rathbone, is formerly director of recreation in rehabilitation, Teachers College, Columbia University.

You may proceed.

STATEMENT OF JOSEPHINE RATHBONE, FORMERLY DIRECTOR OF RECREATION IN REHABILITATION, TEACHERS COLLEGE, COLUMBIA UNIVERSITY

Dr. Rathbone. Gentlemen, today it is my great pleasure to present the Consulting Service on Recreation for the Ill and the Handicapped

of the National Recreation Association.

We are not here to quarrel with any concept enunciated in bill H.R. 3465, except possibly the implication that grants shall be forthcoming only when assurance has been given that the facility or program is "feasible and necessary for vocational rehabilitation"—page 6, section 203(a)(1) and page 17, line 20, even outside the competitive labor market, page 15, line 17.

We see independent living as meaning something different from vocational self-sufficiency, for many severely handicapped and older

persons, page 2, lines 3 and 4.

Health and the American Public Health Association are among the national bodies that have studied the opportunities, the responsibilities and the measures to be taken, along with the costs and the dividends.

Our Connecticut White House Conference Committee for Children, 1959, and our new White House Conference Commission on Aging are directing specific

attention to these problems.

4. A few comments may be made, and questions raised concerning some of the

bills which have come to attention.

On January 7, 1959, and on January 27, 1959, were introduced bills H.R. 1119 by Mr. Fogarty and H.R. 3465 by Mr. Elliott, respectively, both "To provide evaluation of rehabilitation potentials and rehabilitation services to handicapped individuals who as a result thereof can achieve such ability of independent living as to dispense with the need for expensive institutional care or who can dispense with or largely dispense with the need of an attendant at home to assist in the establishment of public and private nonprifit work-

shops and rehabilitation facilities and for other purposes. The purposes are clear and indicate foresight in developing planning. section 2(a) of H.R. 1119, an amendment is obviously related to Public Law 565, 83d Congress, chapter 655, 2d session, S. 2759, an act. Provisions for grants under section 202(g) title II seem to be clear. Under section 203, page 7, is a new State rehabilitation agency intended in lines 11 and 12? Improvement of conditions in existing agencies in a manner to provide for joint planning and cooperative action and adequate medical guidance will be important: and it is hoped that multiplication of State agencies will be avoided. The preparation of a "flow chart" and of methods for distribution of authority and funds in some localities will show the confusion and cumbersomeness of too many "cooks", often operating somewhat independently even though the intention is to benefit a handicapped person and a family. On page 12 of this bill, page 12, under definitions, and the same in H.R. 3465, what is meant by "therapeutic treatment"? Does this include medical advice, prescription, and supervision? On page 13 of these bills, line 2, will he "no longer require such institutional care", or that such care and attendance may be substantially reduced, or does this imply no care as referred to possibly on page 2, (b), line 10 and 11?

On page 15, (b)—in considering "but not be limited to * * *" reference may be made to paragraph (B) on page 15 as to relationships. Possibly this might state something such as: the following provided they are under medical direction, or supervision, with prescription. Among the ideas here is the question if

there is enough reference to medical guidance.

Turning to the good House Joint Resolution 316, of Mr. Fogarty of March 19, 1959, paragraph 2 of page 1, does the term remediable in 80 percent of the cases refer to medically remediable or to other factors? In paragraph 3, is the definition of rehabilitation worker clear in this context? On page 2, should emphasis be given under reference to training that this can be done best in a medical setting, preferably in affiliation with a medical teaching institution? On page 3, reference to medical supervision is lacking. On page 4, is it practical in lines 6 and 7 to include a medical practitioner? When we see the value given by Dr. Krusen in the Office of Vocation Rehabilitation recently, we see great possibilities. On page 5, section 4, advisory committee, members "shall be chosen from" etc. This is good but is not in the Elliott bill—House Joint Resolution 494. Is a person in physical medicine desirable? In House Joint Resolution 494, is there sufficient provision for medical help and advice? (e.g. p. 4, lines 13–20.) On page 5, lines 11–17, no M.D.'s are mentioned.

5. Illustrative Histories

(a) My attitude, both personal and professional, toward comprehensive rehabilitation was profoundly influenced by an intimate and impressive experience I had with a college student and his family. He lost the sight of one eye, had both hands blown off, and suffered other injuries in a laboratory explosion in 1938. The initial effect of this accident, in the midst of his professional education, was shattering to his morale and greatly handicapped him physically and in building a satisfactory career, but through sympathetic and highly skilled assistance that was fortunately available to him, he went on to complete a Ph. D. degree in chemistry and has become internationally known in the highly technical field of combustion, in its application to jet engines, rockets, etc. He drives his own car and travels extensively by himself, in the United States, Europe and

the Far East. He has achieved a happy home life, is the father of two boys who he joins frequently on skiing outlings, and is active in his church and the social life of his community. The native intelligence and courage that this man possessed contributed greatly to this happy result, but it is very doubtful if these would have been nearly as effective without the understanding, encouragement and training received from rehabilitation personnel.

(b) Two case histories from the experience of a former Welfare Fund Medical

Director, now a hospital director, will illustrate this further.

Case 1.—A 37-year-old woman became aware of increasing weakness and numbness in her legs and a few months later she was unable to walk. The diagnosis of a small hospital in another State was multiple selerosis, with loss of sensation and use of legs. As many of you know, the cause of this disease is not known, but sporadic patches of sear tissue develop in the brain and/or spinal column, causing a variety of disorders.

The Welfare Fund referred her to a rehabilitation center, where a diagnosis of spinal cord tumor was made and a successful operation removed a benign

tumor close enough to the spinal cord to have caused the symptoms.

She is now a healthy woman having avoided the life of a severely handicapped person because of this evaluation. The cost to the fund was \$1,000, but the cost to the community for her care would have been many times as much if she had not received a sound diagnosis and excellent management for an unexpected condition.

Case 2.—An 11-year-old girl developed slowly progressive weakness of her legs in July, 1945. In 1949 her situation was brought to the attention of the fund by her family physician. The diagnosis, muscular dystrophy—another

disease of unknown causes—gave little hope to all concerned.

She was sent to a rehabilitation center in March 1949, where a deficiency disease that can be controlled by regular medication, was diagnosed. She was discharged within 2 months "very nearly a normal girl, as long as she continues to take regular doses of a medicine—prostigmine. She finished her high school education, married in 1953 and has three healthy children. At a cost of less than \$3,000 and because of a thorough evaluation, she is living a normal life and avoiding the suffering and expense of disability.

(c) Prior to my becoming a member of the board of directors of Gaylord Farm Sanatorium, its services had been limited to the care and rehabilitation of persons afflicted with tuberculosis, for which it had an outstanding reputation over some 50 years, under the direction of a wise and skillful and understanding physician, Dr. David Lyman. Since this disease is being brought under control through improved treatment, Gaylord has had an opportunity to broaden its field to include rehabilitation services for persons having any remediable disability. I will now cite three case histories from our experience there, that

I think will be helpful to the committee.

Case 1.—A 64-year-old man was admitted in December 1956 with his left leg amputated above the knee, diabetes in mild form and congestive heart failure due to an insufficient supply of blood to the heart muscles. A year prior to admission his wife had died, after prolonged suffering, from cancer. Since her death he lived alone, ate irregularly at various restaurants and never regained interest in living. His diabetes got out of control and possibly because of this, his left foot became so badly infected that his leg had to be amputated above the knee.

Following amputation, he was admitted to Gaylord in no mood for vocational rehabilitation or independent living. Readjustment to the point that a nursing home could handle his medical and social needs seemed about the best that

could be expected.

This man was a patient from December 28, 1956, to June 28, 1957. He received daily medical supervision; rehabilitation nursing; frequent laboratory studies; physical, occupational, and work therapy; social service; vocational counseling and guidance; planned social activities; a therapeutic diet, and practical instructions about the preparation and selection of food.

As the treatment progressed, the patient began to develop higher goals for himself which he "sold" to the Gaylord staff and to the Connecticut Bureau

of Vocational Rehabilitation.

Men in their 60's are often unable or unwilling to use artificial limbs, but we found in this man such a desire for self-sufficiency that an artificial leg was purchased for him by the Bureau of Vocational Rehabilitation. While the patient was not well coordinated, he was so well motivated that after several

weeks he could walk. Today, he is living alone in a small neat apartment, where he does all of his own housekeeping and cooking. The rest of his story is best told in his own words in the following letter which I received from him under date of June 9 of this year.

"Dear Doctor: You will, I am sure, be glad to hear from one of your former patients, a patient who was brought under your charge on a stretcher, with very

little expectation of ever being thankful for anything or anybody.

"Today I am glad to inform you I am employed in a business office, drive a car, have paid back to the State welfare the money they advanced for my hospital care, and am paying the bills accumulated during my wife's and my illness. All this I attribute to the treatment I received at your institution—the physical therapy, the medical care, the personal attention, and the followup after I left Gaylord. Again I want to thank you for what you did for me and are doing for others. Gratefully yours."

I would like to remark here that rehabilitation is not the most remunerative field open to the doctor of medicine and one engaged in it who does not get a big lift out of such a letter would do well to change to a field where the remunera-

ation is paid entirely in money.

Case 2.—A 37-year-old woman with three children under 9 years of age was admitted to Gaylord on February 22, 1956. A college graduate, with a master's degree in music (piano), she had taught for several years. She was disabled by a devastating disease, lupus erethematosia, which had affected her nerves, joints, and internal organs, causing severe pain and paralysis of muscles. She could not move any muscles below her knees or lift her arms above shoulder level; her fingers were partially paralyzed.

At the time of her admission there was little hope of her return to her family in a useful capacity and no hope for her to again teach plano. The family situation was chaotic; her mother attempted to take care of her three small children. Her husband was unable to carry out his job to the best of his ability because of

demands at home and concern for his wife.

For many months she had an "up and down" course; with her considerable courage and determination, thoughtful physician management, intensive nursing care, physical and occupational therapies, she was finally able to return to her home. Upon her discharge on March 25, 1957, after more than a year of hospital care she could walk with two short leg braces free of pain. She tires easily, with with scheduled rest she manages her home, her children, and is again teaching piano. Most important, she is home with her family, without need of daily medical care.

Case 3.—A 19-year-old boy was admitted June 20, 1956, with a 2-year history of Guillian-Barre syndrone—a disease affecting the body's nerves, which is marked by pain, tenderness, and weakness in the muscles supplied by the affected nerves. After staying 9 months at a medical center and 1½ years at a chronic disease hospital, he came to Gaylord so limited in his abilities that his only diversion was painting by holding the brush in his teeth. There had been no noticeable

progress during these 27 months.

The goal was to teach him to live independently. Special devices were prescribed so he could increase his usefulness. Daily physical therapy also served to prevent contractures at the joints. His muscle strength gradually improved. Special devices became unnecessary. Our reevaluation gave us confidence to plan even beyond the goal of independent living—useful employment.

One year after admission he was discharged, completely independent. Using one cane, he attended his high school graduation. For the past year he has been

employed by the Fuller Brush plant in his hometown.

This successful rehabilitation required the cooperation of 15 separate services, as well as the patient and his family.

General methods employed

The above specific cases are generally typical of the methods employed at Gaylord.

We feel that a large number of highly trained, highly skilled services are required for the best results. In addition to a full-time staff of doctors, nurses, therapists of various kinds, and social workers in the several categories of human need, we are fortunate in having a consulting staff of outstanding specialists from the New Haven area who visit Gaylord twice a week to consult with the full-time staff on special problems. With this staff, we feel we have the best advice available on almost any condition that may be encountered.

We also maintain close working arrangements with several medical centers, including the Grace-New Haven and Hartford Hospitals; all of Connecticut general hospitals; and all voluntary and special agencies offering related services. Following discharge from Gaylord, the services of family physicians, visiting nurse associations, and rehabiltiation centers, such as those established in New Haven, Hartford, Stamford, and Meriden, are freely used and have proven most

In addition to the above, we feel that it is very important that a patient's skills, his remaining abilities, or his potential abilities, should receive imaginative consideration and for this purpose a workshop equipped with a variety of machines and hand tools, is invaluable. Gaylord was fortunate in receiving a special grant from the Office of Vocational Rehabilitation in July 1958 for developing such a shop. This shop enables the staff to measure and develop work tolerance while exploring work skills, but most important is the effect on a patient's morale of finding himself able to do usful work. It banishes the enervating feeling of uselessness and dependency and gives him the courage to seek self-support.

Mr. Giaimo. Dr. Robcliff V. Jones, Jr., associate in physical medicine and rehabilitation, University of Connecticut, will be our next

H. Kenneth McCollam, executive secretary, Connecticut Board of Education for the Blind, and Guy Marchisio, chief, Children's Service, Connecticut Board of Education for the Blind.

STATEMENT OF H. KENNETH McCOLLAM, EXECUTIVE SECRETARY, CONNECTICUT BOARD OF EDUCATION FOR THE BLIND, HART-FORD. CONN.

Mr. McCollam. I am H. Kenneth McCollam, executive secretary of the Connecticut Board of Education for the Blind.

I am going to speak briefly from the braille outline that I have

before me.

If I may, I request the permission of the committee to file a copy of what I am going to say and try to cover at a later date.
Mr. Giaimo. Without objection, you may.

Mr. McCollam. I would like also to cover briefly the rehabilitation aspects of the discussions that we have before us and ask Mr. Marchisio to follow me with a summary of the matters pertaining to special education.

I want to open by expressing gratitude to the committee for the privilege of coming before you and also for the rare privilege that I think all of us had in sharing in the workshop study group that has

been held in the previous 2 days in New Haven.

In connection with that, I think it gives those of us who at the agency level work with the blind a rare opportunity to meet with people of all interests in work for the blind, including, as Mr. Istas pointed out, people representing the Federation of the Blind and others with whom we sometimes have difficulty in sitting down with and sharing their thinking.

This has been a very worthwhile meeting and I think all of us have

gotten a great deal out of it.

In connection with that, I wish to go on record here in favoring the report submitted by the workshop project by Mr. Greehan and we thoroughly endorse all of the proposals that were presented by him.

I would also like to go on record in favor of the bill for independent living as presented in 3465. We feel that that is a type of legislation that is seriously needed in work for the blind in particular, although it has many great benefits to other types of handicaps than the blind.

We feel that the rehabilitation setting and the training that agency people have would be the proper place for the administration of the

independent living provisions.

I would like further to recommend that the opportunity for training of personnel through grants, through traineeships, or through any of the many other avenues for obtaining specific training in the areas of the handicapped be encouraged and promoted in every way possible.

As many of you have already been told by other people who have presented their view here, there are a great many areas in which there is need for skilled professional workers working with the handicapped

groups.

One particular group that I wish to mention particularly would be that of mobility trainer. We all know the difficulty that presents itself to any blind person in getting about. In recent years there has been developed a skilled mobility training and getting about by the use of cane or other recognized methods of guidance.

There has been no place in the country up to this point where a person may be trained in the skills which he could then later impart

to blind clients.

If at all possible through the provisions of any of the bills before us we would urge that attention be given to this particular lack.

There has been a study made recently by the Office of Vocational Rehabilitation in conjunction with the American Foundation for the Blind in this area, and we hope from that will come some definite

proposal.

Another point that I would like to emphasize again in the field of training, the need for a type of apprenticeship training that might be possible wherein a well trained, from an educational or academic point of view, a well trained individual, who may come out of one of the courses that Congress has made possible through the extension of the Vocational Rehabilitation Act, come out with a master's degree, but with no practical application of the theory that has been learned and learned well.

What I would suggest here is that Congress, through extension of the Vocational Rehabilitation Act, make possible grants which could be used for the financing internship or apprenticeship type of course in the States whereby these college graduates, ofttimes with a master's degree, can obtain a practical experience necessary to make them a

worthwhile worker in the field of work for the blind.

The reason that the State cannot always do this or accomplish this very thing is because of the limitation of budgets, also the fact that there are serious restrictions on the matter of taking a person on your staff and then having to put him through a lengthy training period or

internship.

I would also like to speak briefly on the broadening of the provisions of the Hill-Burton bill, which would encompass the establishment of rehabilitation centers, possibly not medically oriented or medically backed, but the type of center that would provide to blind people throughout the country the facilities that they are so rarely lacking in the field of prevocational and vocational training.

We have centers throughout the country for adjustment to blindness. The number of centers or places where we can expose blind clients to prevocational training or limited vocational training as well as the exposure to the various social needs of the individuals are lacking to a very high degree.

In the New England region some studies have been made by the Office of Vocational Rehabilitation with the thinking that perhaps

a regional center might be established.

The numbers that have been indicated on the basis of this study are relatively small and it seems that it might not be feasible for a re-

gional center for the blind alone.

I would welcome any thinking that might be possible in following out the recommendations of one of the previous speakers that a rehabilitation center on a regional basis for other types of handicap might also include the rehabilitation and training of blind individuals.

I would also like to endorse the recommendation made by Mr. Mungovan of Massachusetts at the hearing yesterday on the matter of the withdrawal of the need for applying the means test for readers

for blind students.

That has presented a great deal of difficulty. We are allowed under the provisions of Public Law 565 to pay for tuition for a blind student without necessarily applying the means test. When we have to provide him with readers in order to obtain the education that he needs, we do have to make the application of the means test under the present provisions.

I would like very much to see that changed if at all possible.

In the interest of time I think perhaps now I will relinquish the balance of the time that has been allotted to me to Mr. Marchisio to deal with the special education.

Mr. Giaimo. Thank you, Mr. McCollam.

May I say to you, Mr. Marchisio, in the interest of time will you summarize your statement as best you can and then leave your prepared statement with us.

(The statement referred to by Mr. McCollam follows:)

OUTLINE OF NEEDS OF BLIND PERSONS IN CONNECTICUT AND PROPOSAL FOR CHANGE
IN EXISTING LEGISLATION

(By H. Kenneth McCollam, executive secretary, Board of Education of the Blind, Hartford, Conn.)

The board of education of the blind is an independent State agency charged with the responsibility of bringing multiservices to the blind of Connecticut. The register of known blind persons contains the names of some 3,700 individuals. The current budget of the agency calls for the expenditure of \$600,205 annually and of this amount \$327,200 is expended for education of blind children.

Representatives of this agency had the privilege of sharing in the 2-day workshop sponsored by the study committee established under the subcommittee of Congress and wished to go on record as endorsing the proposals submitted by Mr. Frederick D. Greehan, chairman of the section working with the visually

handicapped.

The agency would further wish to be recorded as in favor of the passage of the independent living bill 3465 that is presently before Congress. It is the belief that the needs of blind persons could best be met by the administration of this new program through the well-established and professionally staffed personnel of the agency presently carrying out the provisions of the vocational rehabilitation program.

In order to meet some present gaps existing under the Vocational Rehubilitation Act of 1954 (Public Law 565), it is further recommended that Congress make available training grants to universities or colleges to establish training programs for mobility instructors for the blind. The need for mobility is probably one of the greatest in work for the blind that exists at the present time. Attempts through organizations such as the Hines Hospital of the Veterans' Administration and a few additional provide adjustment cetners to mee this need; but the number of trainess that they are able to accept is so limited that years will be required to begin to meet the need in the several States. It is estimated that Connecticut might well use the services of two or more mobility instructors on a full-time basis, if properly trained personnel were available.

A secondary training project which seems highly desirable in the effort to obtain well qualified and trained personnel in the various areas of work for the blind, is the need to establish a training grant available to the several States that would provide the adequate compensation for an apprenticeship trainee for a period sufficiently lengthy to give him the much needed practical experience in the area of work for which he had been academically trained. Many persons are utilizing the training privileges under Public Law 565 to obtain master's degrees in vocational rehabilitation but have no opportunity to gain practical field experience that would enable them to be employed directly by a State agency. Most State agencies require at least 1 year of experience beside the college

education.

It is suggested that the Hill-Burton law be amended to permit the use of the funds available under its provisions to be used for establishment of a rehabilitation center that would include prevocational and vocational training over and above the medical services which are presently required. It is suggested that studies be made to determine the need for such rehabilitation centers on a regional level and of a nature that would offer services to blind clients as well as to those of other handleans.

It is recommended that a study be made of the application of the formula for allocating funds under Public Law 565 to reflect the need of certain States with a high per capita income who are receiving meager allocations of funds under section II of the allotment, which involves additional support funds available to the States as a whole. For example, in Connecticut, over the past 4 years when rehabilitation funds to the States in general have risen from \$23 million to \$53 million, this State has received only the following amounts of these funds:

1956	\$63, 045
1957	58, 322
1958	48, 885
1959	44.899

It is recognized that the general application of the formula used in allotting funds to the states is generally acceptable to the country as a whole. It could be readily seen, however, that the great benefits derived by States with lower per capita income are being denied to Connecticut where despite the financial well-being of the State in general, there are limited funds available for vocational rehabilitation purposes. It is suggested that some thought be given to providing additional funds over and above the formula quota that could be made available on a State-matching basis of dollar for dollar.

This agency would also favor the removal of the requirement under the regulations of Public Law 565 of application of the means test to the provision of reader services to blind students. This regulation does not seem to be consistent with the payment of tuition fees without application of the means test, while at the same time the necessary reading service to permit a blind student to

pursue his studies should be so stipulated.

It is further recommended that the provisions of the aid to the blind be modified so as to permit a larger amount of earned income to be exempt before an AB grant would be modified. The original provisions of the act stipulated that \$50 a month of earned income would be exempt. It is recommended that this exemption should be amended to read \$100 of income from any sources be exempt.

This agency wishes to express appreciation and gratitude to the committee for making it possible to appear and to participate in the workshop and hearings in connection with its study. It is further requested that this written

report be made a part of the congressional record of the hearings.

STATEMENT OF GUY MARCHISIO, CHIEF, CHILDREN'S SERVICES, CONNECTICUT BOARD OF EDUCATION FOR THE BLIND

Mr. Marchisio. Mr. Chairman, gentlemen of the committee, I would like to say initially that these points that I presented, these recommendations, although given to you from the point of view of Connecticut, I believe they apply pretty much to the whole country.
We have some eight points. We are asking that Federal help be

given in the preschool area.

Very few of the States have sufficient funds particularly to help parents with the problem of blindness in children. Very few States.

including Connecticut, have outright funds for this program.

We think this should become a definite part of the educational This is true of blind children as well as any other children where not only do you need help to assist the parents but a more formalized type of service is needed in terms of getting the children ready before school.

Two, the establishment, as has been mentioned here several times, of the regional diagnostic and treatment centers. The centers, par-

ticularly for multiple-handicapped children.

I would like to stress multiple-handicapped blind and also emphasize the emotionally disturbed ones. This is likely to be an area that is omitted in the states where the service is for physically handicapped, but not for the emotionally disturbed or people with emotional problems, with the additional handicap of blindness.

Three, again I think you have heard on this, the establishment and award of scholarships and graduate fellowships, not only on the university level. I am a little concerned about this, having taught at the university level myself, and this can become quite theoretical.

I think there should be two additions added to our scholarships, two

phases:

One, that these also be given on a part-time basis as well as a fulltime basis; that is, a person who is already working on the job, particularly in the teaching field where training is very expensive and salaries are not too high, and also in terms of practical knowledge.

Scholarships for training centers, for traveling to agencies and centers to see what is going on, this type of thing, as well as university

training.

Four, I would like to read this one.

(A) Increase the Federal quota grant substantially above the \$30 per pupil basis with a formula that will not place the smaller States at a great disadvantage.

(B) Distribution of the Federal quota grant to additional and varied manufacturers of educational materials and equipment for all

visually exceptional children.

(C) Provision for proportionate representation from both public school and residential school personnel (ex officio members of the board of trustees) in the administration, selection, manufacture, and distribution of materials and equipment from the American Printing House for the Blind.

Now, our fifth point is asking that statistics be included in the

census.

I think you have heard from this one before, particularly in the light of the population, the age distribution and the job classification of all legally blind people.

Six, a redistribution of the regional libraries for the blind.

The State libraries where you actually have a reflection of the State needs.

A recognition that blindness is not total blindness alone, that these libraries should distribute large print materials to partially seeing

people, particularly in the literature, the nontextbook line.

Seven, the serious dearth of large print textbooks and other literature, after decades of sporadic effort, remains one of our most urgent problems to be solved as far as the partially seeing child is concerned. Many people have tried to tackle this and do something about it, but very little has been done. If you find that the States cannot lick this problem, then perhaps this is the time for the Federal Government to step in.

There is nothing, very little in the literature, in the recreational reading line, of large print books. We are asking here that the Federal Government make a study and perhaps distribute this material from the American Printing House and through the Library of

Congress or grants to States.

Finally, I would like to preface my remarks on this one because I have been a great booster for volunteers in the area of blind people,

of helping to transcribe braille books and so forth.

In fact, I am on the board of trustees of the national organization and also very active on the executive board of the National Braille Club, so I would like to show appreciation of what the volunteers have done and there is a place for them.

However, my point is that the blind are almost the only group of handicaps that have to depend on volunteers in their formal education. Therefore, we say legally blind children are entitled to an education at least equivalent to the education they would have had if they could see sufficiently well to do their schoolwork in the usual way.

In this regard the Federal Government should seriously consider the possibility of paying for the materials ordinarily provided by volunteers, thus instituting a service adequately designed to meet the need, when needed, and without fostering the very charity that has followed the blind individual through the ages.

This may be done through direct grants to the States, through agreements with publishers, or through the Library of Congress or American Printing House for the Blind acting as a clearinghouse for

subcontracting orders from the States.

Thank you very much.

Mr. GIAIMO. Thank you, Mr. Marchisio. (The statement referred to follows:)

A STATEMENT CONCERNING EXPANDED SERVICES TO VISUALLY HANDICAPPED CHILDREN AND YOUTH BY THE FEDERAL GOVERNMENT

(By Guy J. Marchisio, chief of children's services, State Board of Education of the Blind, Hartford, Conn.)

There are a number of unmet and partially met needs to blind and partially seeing children and youth in which the Federal Government may help and in which the States are finding it difficult to provide services.

1. Recognize the preschool service to blind and partially seeing children as an adjunct to formal education by providing Federal matching grants to the States in a phase of the work lacking sufficient funds for stimulating early preparation for school. Such a service should include individual instruction and counseling

to parents and children as well as nursery school training.

2. The establishment of regional diagnostic and treatment centers and the provision of such services within presently recognized facilities through Federal grants to the States for building and staffing facilities for minimal-cost service for multiple-handicapped children and blind and partially seeing children with additional handicaps, to include visually handicapped children with emotional problems.

3. Substantial scholarships and graduate fellowship aid for the personnel concerned with all phases of education of visually exceptional children on both a full- and part-time basis. Some Federal grants are available for this purpose on a full-time basis, but little or no funds are provided for staff development in a field where salaries are low and cost of training is high. Similar grants are now available to vocational rehabilitation staff in the several States under the Vocational Rehabilitation Act 4A1—special projects grant.

4. (a) Increase the Federal quota grant substantially above the \$30 per pupil basis with a formula that will not place the smaller States at a great

disadvantage.

(b) Distribution of the Federal quota grant to additional and varied manufacturers of educational materials and equipment for all visually exceptional

(c) Provision for proportionate representation from both public school and residential school personnel (ex officio members of the board of trustees) in the administration, selection, manufacture, and distribution of materials and equipment from the American Printing House for the Blind.

5. Provision in the Federal census for accurate statistics on the population, age distribution, and job classification of all legally blind individuals in the

United States and in the several States.

6. Redistribution of the regional libraries for the blind to State libraries for the blind that reflect State and community needs. A recognition that blindness is not total absence of sight through the distribution of large print books as well as braille and recorded literature by these libraries. A speedup in the number

and variety of talking book records for children is urgently needed.

7. The serious dearth of large print textbooks and other literature, after decades of sporadic effort, remains one of our most urgent problems to be solved as far as the partially seeing child is concerned. It is highly recommended that the Federal Government, through quota grants, extend this service to both the legally blind and true partially seeing child and that extensive research be initiated for obtaining the exact title requested, nonbulky books, most appro-

priate size type, and multicolored photographs and pictures.

8. Legally blind children are entitled to an education at least equivalent to the education they would have had if they could see sufficiently well to do their schoolwork in the usual way. In this regard, the Federal Government should seriously consider the possibility of paying for the materials ordinarily provided by volunteers, thus instituting a service adequately designed to meet the need. when needed, and without fostering the very charity that has followed the blind individual through the ages. This may be done through direct grants to the States, through agreements with publishers, or through the Library of Congress or American Printing House for the Blind acting as a clearinghouse for subcontracting orders from the States.

Mr. Elliott. Has Mr. Arthur L. DuBrow come in? If not, our next witness is Dr. Charles J. Klim.

Is Dr. Klim here?

Dr. Klim. Yes.

Mr. Elliott. Come around, Dr. Klim.

Dr. Klim, our time situation is such, with 40 witnesses today, that we will have to place a limitation of 10 minutes on your statement. With that understanding, you may proceed, sir.

STATEMENT OF CHARLES J. KLIM, ASSISTANT PROFESSOR, SPEECH PATHOLOGY, EMERSON COLLEGE, BOSTON, MASS.

Mr. Klim. This will average seven, perhaps.

Emerson College in Boston was one of the first college units in the country to train students as speech teachers, speech pathologists, and audiologists.

It has its own speech and hearing clinic where students receive the training and supervised practice as a necessary part of their prepara-

tion for certification in the field of speech and hearing.

At the present time there are 135 children and adults seen weekly at this clinic. Lack of physical space and staff limit our services. We

want to expand this facility for the public.

The college also provides part-time speech and hearing help for the industrial school for crippled children in Boston, Tufts University Cleft Palate Clinic, Sullivan Square Medical Center, Holy Ghost Hospital in Cambridge, Woburn Public Schools, and Boston Dispensary which serves the New England Medical Center as a whole.

These programs exhaust the time of our present staff. We are appealed to regularly to survey school systems for need in speech and hearing. We do what we can, but have to turn down appeals for

help due to lack of staff and equipment.

Easter Seal Club, cerebral palsy groups, and medical clinics continually ask for speech and hearing service from us. We do not have the

help to offer help in speech and hearing.

Even New Hampshire clinics call on us regularly for service. In order to keep up the high standard of training for our undergraduate students in speech and hearing and to keep our clinic adequately supervised, our graduate program in speech and hearing has been slow in advancing.

We are being pushed to offer more to graduate students who want to receive higher certification. We need and want to meet this demand.

We now lack the space and staff to expand. With additional funds we could provide immediately the staff and the equipment necessary

for the people who will want advanced training.

Our college clinic has a waiting list for people who need speech and hearing therapy. Expansion of our graduate program would mean increased therapy service to the community. It would mean a place where more bachelor degree students could obtain advance training. It would mean also that many students of speech and hearing would stay in the Boston and New England area to obtain their training instead of leaving for outside of New England and there to study and eventually settle.

The theory is that if they study in New England, they may stave there. With the excellent training facilities connected with the college in regard to speech and hearing, the opportunities for research are excellent. We have not been able to study and to evaluate the many therapy techniques or ideas which may have clinical value; it

may be because of our lack of funds to provide the staff.

We do have the cases. If we had adequate funds we could put to immediate use two more advanced certified people on our staff on speech. We could use another full-time person in hearing if we had funds.

Our facilities are now inadequate. We need soundproof rooms for hearing. We need to double our space in order to better serve our speech therapy clients.

We need to provide more in the way of parent education. We have been requested time and again to provide therapy for adult cerebral

palsy groups and other adult groups.

We have been called upon to help guide the more rural areas of northern New England especially in regard to setting up programs to meet the speech and hearing needs of smaller communities.

These are critical needs. With money and staff we could do much

more to provide initial guidance and survey then we are now able to

Two years ago Emerson College conducted a workshop in the speech and hearing needs of rural areas in New England. The gathering of people who attended to testify as to the specific needs in their communities revoiced what was generally known. They were unanimous in voicing a need for education of parents in the areas as regards speech and hearing and a critical need for diagnostic evaluation by qualified therapists and a drastic need for qualified therapists to provide regular therapy in the rural areas.

Today the need in these areas is just as great and just as critical as

2 years ago.

The colleges in New England need funds to provide the increased staff and to recruit students who could fill some of these needs upon

graduation.

The students who graduate from our college have no difficulty gaining employment. The number of positions far exceeds the number of graduates who have been turned out annually.

This picture will continue in spite of increase in graduates.

My own introductory course in speech and hearing this semester has 62 students enrolled. These are potential therapists. This is

our largest single class.

We hope this kind of increase will continue. Nearly half of these at this early point in training have voiced a desire to go into graduate training in speech and hearing. They are faced with a real problem of finance on the graduate level. The expense of undergraduate training alone today is all that most parents can afford. This is where most parents stop.

In order to go to graduate school the student must support him-This is difficult. To encourage them we need fellowships, traineeships, and grants for some years to come to help them continue their studies. Federal grants would be most welcome.

are now and will be desperately needed in New England.

Thank you.

Mr. Elliott. Thank you very much, Dr. Klim.

Are there any questions of Dr. Klim.

Thank you, Doctor.

Our next witness is Mr. L. P. Simons. Is Mr. Simons here? Mr. Simons, I regret that it is necessary that we impose time limita-

tion of 10 minutes.

Mr. Simons. That is all right. Most of the material I will present is in the document you have. I will abstract it.

Mr. Elliott. Without objection, the complete statement of Dr. L. P. Simons will be made a part of the record, following his oral presentation.

You may proceed, Mr. Simons.

STATEMENT OF L. P. SIMONS, EXECUTIVE DIRECTOR, EPILEPSY INFORMATION CENTER, BOSTON, MASS.

Mr. Simons. Thank you.

Of the 1,500,000 epileptics in the United States fully 80 percent have seizures eliminated or reduced to a minimum. Translated in terms of employment this means that 80 percent properly can be employed in competitive industry.

employed in competitive industry.

Unfortunately, being able to work does not mean the epileptic can find a job. There are many industries that will not hire an epileptic even if completely controlled, let alone employ him if attacks occur

as frequently as once a year.

The employers offer the following reasons as to why they cannot hire an epileptic:

One, that he has a high enough accident rate.

Two, that his workman's compensation rates automatically rise when an epileptic is employed.

Three, epileptics have a high absentee rate.

Experience has demonstrated, both through research and on-thejob experience, that this just is not true.

For example, in 1958, the Ford Motor Co. in Dearborn, Mich., re-

ported not one accident out of 165 workers with epilepsy.

In 1951, the U.S. Department of Labor study demonstrated there is no significant difference between the disabling and nondisabling accident rate of epileptic and nonimpaired workers.

The workman's compensation board in New York found that the average number of closed cases involving epileptics was only 10 out

of 100,000.

It would not seem that people with epilepsy are particularly acci-

dent prone.

As far as workman's compensation rates, rates are based on experience rather than whether handicapped people are employed? It was found also in 1951, the U.S. Department of Labor study,

It was found also in 1951, the U.S. Department of Labor study, that epileptics actually lost less time because of accident than the nonimpaired worker.

The problem of the epileptic in industry seems to be primarily that

of education. We know that the epileptic can work. They find it

difficult to get a job.

I would like to propose a three-point program that the Federal Government do undertake to show leadership in getting epileptics back to work.

The first point is education. Since our attitude bars the epileptic from employment I recommend that the Federal Government provide funds for an epileptic education program and program developed in the following manner:

One, that the Secretary of Health, Education, and Welfare call an epileptic-in-industry conference by industrial leaders, that this conference be expanded to the State level and that this Government pro-

vide funds through the State offices of rehabilitation for the education of business leaders regarding the employability of epileptics.

Two, Workman's Compensation

Three, improving vocational rehabilitation techniques. Most people with epilepsy who require rehabilitation and placement are referred to their local office of vocational rehabilitation.

Thank you very much.

Mr. Elliott. Thank you, Mr. Simons. (The formal statement of Mr. Simons follows:)

STATEMENT OF L. P. SIMONS, EXECUTIVE DIRECTOR, EPILEPSY CENTER, BOSTON, MASS.

Yesterday this committee heard Mrs. Albert Grass, president of the American Epilepsy Federation, discuss the problems of the epileptic child in school.

Today, I would like to discuss the epileptic in relation to employment.

Of the 11/2 million epileptics in the United States, fully 80 percent can have their seizures eliminated or reduced to a minimuu. Translated into terms of employment, this means that 80 percent, or over 1 million epileptics, properly placed, can be employed in competitive industry.

This is not to imply that a great many of the 15-percent group of epileptics who are not so well controlled cannot work, but, rather, that the 80 percent

segment should present no problem to industry at all.

Unfortunately, being able to work does not mean that the epileptic can find a job. There are many industries that will not hire an epileptic even if he is completely controlled, let alone employ him if his attacks occur as infrequently as once or twice a year.

Loyalty to tried and trusted employees goes out the window when epilepsy

is involved.

For example, we have the case of a man who was employed by a large insurance company for 7 years and was summarily fired when the company learned that he had had a seizure at home. The seizure resulted simply because the fellow had run out of medication.

Why does industry object to employing the epileptic? Employers offer the

following reasons as to why they cannot hire epileptics:

1. The epileptic has a high industrial accident rate.

Workmen's compensation rates automatically rise when an epileptic is employed.

Epileptics have a high absentee rate.

Epileptics can perform very few jobs.

5. Other employees object to working with an epileptic.

Let us look at these objections and see how they stand up in the light of documented data.

Do epileptics have more industrial accidents than the nonimpaired worker? As of 1958, according to the safety director of the Ford Motor Co. plant in Dearborn, Mich., there was not one accident worth noting, out of 165 workers, with epilepsy. Of course, seizures occurred, but they did not result in accidents.

A study by the U.S. Departmeent of Labor in 1951 demonstrated that there is no significant difference between the disabling and nondisabling accident rate of epileptics and nonimpaired workers.

The Workmen's Compensation Board of the State of New York found that in the 8-year period, 1945-52, the average number of closed cases involving epileptics was only 10 out of 100,000.

In view of these facts it is evident that the epileptic worker is not an industrial accident risk. The attitude that he is, as held by industry, is completely without foundation.

Do workman's compensation rates automatically rise when an epileptic is hired?

In 1954, the Association of Casualty & Surety Cos. issued the following

statement as regards workmen's compensation rates:

"Insurance rates are based on accidents involved in operation and the company's accident experience. No consideration is given whatsoever to the question of whether or not handicapped workers are employed."

Here again we can see that misinformation is hurting the epileptic in his search for employment.

Do epileptics have a higher absentee rate than the nonimpaired worker.

The 1951 U.S. Department of Labor study uncovered the interesting fact that the epileptic actually loses less time because of accidents than does the nonimpaired worker.

Further, the study showed that the work attendance records of epileptics were the same as for those on the nonimpaired worker.

Again, we have another meanlingless argument.

Are epileptics limited as to the jobs that they can perform?

According to the pamphlet, "Patterns of Disease," published by Parke, Davis

& Co. in 1958, epileptics were holding jobs in the following areas:

"Professional, business, and college students, 27 percent; clerical and skilled workers, 28 percent; sales and service workers, 20 percent; unskilled laborers. 25 percent."

From these statistics it can be seen that epileptics can handle jobs in every

field of endeavor.

Do people object to working in close proximity to an epileptic?

Unfortunately, in some instances this is true, but it is not irrevocable. The Epilepsy Information Center has found that this problem can be solved when an employer will take time to interpret epilepsy to his employees.

The facts that I have just presented show conclusively that there is no valid reason why an epileptic who is completely or relatively free of attacks cannot

be placed in competitive industry.

Further, the data indicates that the underlying reason the epileptic has difficulty with employment is not due to his physical condition, but, rather, due to the erroneous attitudes of industry toward him.

We cannot afford to allow these attitudes to continue indefinitely. Such attitudes are degrading and rob people with epilepsy of their dignity, they are

causing a pool of potentially productive workers to be untapped.

From an economic point of view it is costing the taxpayers of this country a lot of money to support a group of people who are not working because of facts that were valid 100 years ago.

Since returning the epileptic to gainful employment is a national problem, I believe the Federal Government should become more active in this area. would like to propose a three-point program which, if adopted by the Federal Government, would lead the way to acceptance of the epileptic by industry:

1. Education

Since outdated attitudes are barring the epileptic from employment, I would recommend that the Federal Government provide funds for an epileptic-inindustry educational program, and that the program be developed in the follow-

A. That the Secretary of Health, Education, and Welfare call an epileptic-in-industry conference composed of industrial leaders throughout the Nation.

B. That this conference be expanded to the State level.

C. That the Federal Government provide funds through the State offices of vocational rehabilitation for the education of business leaders as regards the employability of epileptics.

2. Improving vocational rehabilitation techniques

Most people with epilepsy who require rehabilitation and placement are referred to their local office of vocational rehabilitation.

Unfortunately, because these units have large caseloads, and because of the difficulties in placement the epileptic is often overlooked or written off as not

being suitable for rehabilitation.

To remedy this situation, I would recommend that the offices of vocational rehabilitation located in large urban centers establish within their organizations a division of epileptic services for a 5-year period. This special service devoted solely to epileptics would have its own counselor, social worker, and placement officer.

By establishing a division of epileptic services, I believe the following would be accomplished:

1. Rehabilitation services would be available to a more diversified group of epileptics.

2. A fund of knowledge about the employability of epileptics would be built up.

3. A concentrated effort to breaddown employer resistance to the epileptic would result.

4. Realistic standards for the employability of epileptics would be

established.

Although there is a certain amount of resistance to establishing special services for special groups, I believe that the problems of the epileptic are so complicated that at least for a trial period of 5 years a program offering the epileptic specialized employment services is required.

3. Prevocational counseling

If the handicapped child is to develop into an economically productive adult he must have expert prevocational counseling by people who are familiar with the requirements of industry in this regard.

Also, the handicapped child must have counseling very early in his academic

career.

I would, therefore, recommend that the Federal Government make additional funds available through the local offices of vocational rehabilitation for prevocational counseling of handicapped children and that this counseling be offered at the junior high school level.

In closing, I would like to say that money spent by the Federal Government in returning people to work comes back to the Government in the form of increased

tax revenues.

I can think of no better source of new tax money than the 6 million handicapped people in America.

Mr. Elliott. Our next witness is Mr. Oscar K. Weiner.

Is Mr. Weiner here.

Our next witness is Miss Frances Tappan.

Is Miss Tappan here.

Miss Tappan is the technical director of the School of Physical Therapy at the University of Connecticut.

STATEMENT OF FRANCES TAPPAN, TECHNICAL DIRECTOR, SCHOOL OF PHYSICAL THERAPY. UNIVERSITY OF CONNECTICUT

Miss Tappan. In the interest of gaining your complete attention, I

have made my statement very short.

The Connecticut Chapter of the American Physical Therapy Association has asked me to speak to you concerning the educational aspects and in particular connection with the bill H.R. 3465 which is concerned with the most expedient rehabilitation of handicapped individuals.

Obviously, this care depends directly on the number and quality of therapists who can be educated to assume the immediate responsibility

for this rehabilitation.

It is my particular responsibility as an educator to see that this education leads ultimately to the best possible method of physical rehabilitation.

Numbers at this point do not concern me as much as the quality of the therapists which we can graduate in our various schools. This quality depends directly upon the contemporary tools which are available for teaching purposes.

I am particularly concerned to find that, according to rehabilitation and training memo No. 60-5E, Department of Health, Education, and Welfare, under priorities for support places the specific project for development of teaching materials as its fourth priority.

The value of the three priorities which precede this cannot be denied for while it is indeed important to expand existing curriculums, encourage graduate study, and encourage specifically graduate education in physical therapy, it is even more important as I see it, to provide up-to-date, clear, and concise visual aids such as motion pictures, slides, charts, models, and printed materials to assure the fact that the therapists we do graduate are all well prepared to render the best patient care possible.

Other organizations and associations are doing a magnifificent job with scholarships for these students, but there is alse almost no other source other than the Office of Vocational Rehabilitation that will

give us needed help to provide teaching materials.

I have made this point briefly and I hope strongly. Anything you can do to strengthen this aspect of the program would, I am sure, contribute to physical therapy education throughout the country.

Thank you very much.

Mr. Elliott, Thank you very much, Miss Tappan, for your testimony.

You have made a good point and have made it well.

Miss Tappan. Thank you. Mr. Elliott. Are there any questions.

Thank you, Miss Tappan.

Miss Tappan. Thank you Mr. Chairman. Mr. Elliott. Is Mr. Arthur L. DuBrow here?

Is Dr. Robcliff V. Jones here?

Mr. Jones. Yes, sir.

Mr. Elliott. Mr. Jones is an associate in physical medicine and. rehabilitation, assistant professor of medicine of Yale University. We regret that we must impose a 10-minute limitation on you.

STATEMENT OF ROBCLIFF V. JONES, ASSOCIATE IN PHYSICAL MEDICINE AND REHABILITATION, ASSISTANT PROFESSOR OF MEDICINE, YALE UNIVERSITY

Dr. Jones. Rather than go over every point of the prepared statement I have, I would just like to bring out some major points.

Mr. Elliott. After Dr. Jones has summarized her report, then the

report will be made a part of the record, without objection.

Dr. Jones. First of all, I would like to express the appreciation of myself and all of us who are testifying here today and who were at the workshop in the last 2 days.

In regard to the needs for the New England area in rehabilitation, in special education, I think this will come out adequately from the

workshop report that you will hear.

Inasmuch as we are concerned with individuals who have physical and mental handicaps and physical and mental impairments, we are

concerned with individuals having specific medical problems.

Because of this, we are working with patients; and I think it is very important that we have adequate mental direction, supervision, and guidance in the planning of such legislation and in the implementation of this.

Now, as to where the facilities would be set up, or increased, I think this should be in no way limited to any particular group or place. But I do think that where it is possible we should use facilities having to

do with medical schools.

The reason for this is that it would enable us to draw on a pool for future workers in the field, from young medical doctors and allied workers in the coprofessions that work in the medical centers, but I would like to repeat that this in no way means I feel this should be limited to any area like this, but it should be given consideration.

In regard to the independent living bills, 1119 and 3465, I think the goals of these are admirable and I am in entire accord with them.

One of the things that concerns me—and this in no way is a criticism of the bill; it is something that I think we should try to keep in mind when it comes to implement this—is that at present one of the major tests of successful rehabilitation is how many of the individuals that are working on this program are placed in a job.

Now, this extends the area of individuals being helped to a much larger group. I am apprehensive lest, say, the vocational counselor, who now has a larger number of patients to work with and individuals to work with, may not apply himself as vigorously toward the ones

that are potentially employable.

I am merely transferring on to the vocational counselor what I have

to do when I have a lot of work to do.

I try to cover it all and it is very difficult to make this final step, getting a job for the patient.

Mr. Daniels. What do you recommend in this case?

Dr. Jones. All I can say is that this should be kept in consideration in every vocational counsellor's mind when he is working with them if it turns out the vocational counsellor will be the one utilized in carrying out this purpose.

Mr. Daniels. Do you approve the idea of independent living under

that bill?

Dr. Jones. I am sorry?

Mr. Daniels. I say, do you approve the principle of developing the idea of independent living?

Dr. Jones. I certainly do. I am all for it.

But I think we should be careful not to fall into the pitfall that I

can see occurring which I have just described.

In regard to specific points in the bills, I am a little apprehensive about having this all under one agency. I think this probably is necessary to make sure that we have an efficient program, but I am apprehensive that some of the very good groups that have a lot to offer might not be utilized as adequately as if this were dispersed through numerous areas.

I do not know the answer to this administrative problem.

Another point that concerns me some, and I must admit that I do not understand the wording on these particular parts adequately, is that in giving out the funds, say four times a year, if it comes out to be this, or twice a year, if there is some way that we could avoid the situation where, say, in June money may run out and patients have to wait until December before they can be taken on a program and then in December there is a lot of money, relatively a lot of money available, and suddenly everyone is looking for patients to utilize this.

I don't know whether this is a reflection of planning for future

funds for the following year, or not.

I do not know how to overcome this, but I think it is something that should be taken into consideration so that we have a continuing amount of money without feast and famine, so to speak.

Those are the main points I would like to make, sir. Mr. Elliott. Thank you very much, Dr. Jones.

Did Mr. DuBrow come in? Mr. DuBrow. Yes, sir.

Mr. Elliott. Will you come around, please, Mr. DuBrow.

Mr. DuBrow is present of the Connecticut Rehabilitation Association.

I am sorry to say to you, Mr. DuBrow, we have to impose a limitation of 10 minutes.

Mr. DuBrow. I don't think I will take that long, sir.

Mr. Elliott. You may proceed.

STATEMENT OF ARTHUR L. Dubrow, President, Connecticut REHABILITATION ASSOCIATION

Mr. DuBrow. I would like to apologize for being late. I was informed by some people who participated yesterday that there was no need for me to rush since you were running pretty late yesterday. I took that as gospel.

Mr. Elliott. We have speeded up a bit today.

Mr. DuBrow. The Connecticut Rehabilitation Association which I represent has a membership of well over 300 people in the State of Connecticut comprising both professional workers in the field of health, education, and welfare, and also numerous private citizens from all walks of life who are interested in and concerned with the problems of the handicapped.

The association has three points which we would like to present our

viewpoints on.

The first of these is that we are a chapter in NRA as you well know, and we would like to go on record as definitely endorsing in principle

the proposed legislation for independent living services.

However, the Connecticut association is concerned with some of the restrictive elements of the legislation in terms of proposing to make these services available to only two categories of handicapped people, those in institutions and those who are able to afford the luxury of an attendant.

From figures which we have been able to compile from the Connecticut State Department of Welfare, the Connecticut Bureau of Vocational Rehabilitation, and the Connecticut Society for Crippled Children and Adults, it looks as though there are something between 8,000 and 10,000 people in the State who are seriously disabled, who could profit from this kind of service, but who do not fall into these two categories of being in an institution or having and attendant.

Now, this number, of course, is being added to daily in terms of

accident toll and illness and so on.

So this becomes a significant number of people for whom rehabilitation services on the State or Federal level are not available.

We are concerned about the possibility of providing some sort of

service for this group of people.

The second point has to do with the acknowledged shortage of rehabilitation facilities. I think it is pretty well documented that nationwise there does exist a shortage of rehabilitation facilities.

However, the association feels it should be recognized that this situation does not pertain in all parts of the country and there are areas in the country where there are adequate rehabilitation facilities.

It should be noted that these rehabilitation facilities in many cases are not being utilized to their fullest maximum. The proposed legislation holds out the hope that Federal money will be available for building new facilities and for adding to existing facilities, and it is the association's hope that if the legislation is approved, in whateverform it may be, and that Federal money does become available that somebody take a good, long, hard look at the area where the money is going in terms of what the rehabilitation facilities are there and how much use is being made of these facilities before new Federal money is made available for construction of additional facilities.

I think this was our second concern.

The third point that we wanted to make concerned also the shortage, this time in the area of trained personnel. We feel that a good start has been made toward meeting the needs of shortages in terms of rehabilitation counsellors through the present programs in the var-

ious colleges and universities.

However, more and more of the other disciplines are becoming involved in the work of rehabilitation and it would be the association's hope that some provision be made for encouragement, scholarships, training for allied disciplines in terms of medical social workers, psychiatric social workers, psychiatric social workers, psychologists, and other professionals who might be encouraged to enter into the field of rehabilitation and whose services are very badly needed and who are in very short supply.

These are the three major points which the association wanted to present and on behalf of the association I would like to thank the committee for the opportunity of presenting these viewpoints.

Thank your very much.

Mr. Elliott. Thank you, Mr. DuBrow.

Without objection, the the witness' statement will be made a part of the record immediately following the gentleman's oral statement.

Mr. DuBrow. Thank you.

(The statement referred to follows:)

STATEMENT SUBMITTED BY ARTHUB L. DUBROW, PRESIDENT, CONNECTICUT REHABILITATION ASSOCIATION

The Connecticut Rehabilitation Association, which I represent, comprises a membership of more than 300 people in the State of Connecticut. These members are both professional workers in the fields of health, education, and welfare, and also private citizens from all walks of life who are interested and

concerned with the problems of the handicapped.

The Connecticut Rehabilitation Association would like to go on record as heartly endorsing the proposed legislation to provide independent living services. However, the association is concerned with the restrictive elements of this legislation which proposes to make these services available only to those individuals in institutions or to those who have an attendant present. From figures compiled from the State dept. of welfare, the State bureau of rehabilitation, and the Connecticut Society for Crippled Children and Adults, it would

appear that there are between 8,000 and 10,000 disabled persons in this State who do not fall into either of these two categories. These disabled individuals who are not in instutions and who do not have an attendant are just as much in need of independent living services as the two groups specified in the proposed legislation. The daily toll of accidents and disease is constantly adding

large numbers to this latter group.

It has been well documented, that nationwide, there is a shortage of rehabilitation facilities. However, the association feels that it should be recognized, that in many parts of the country, adequate rehabilitation facilities do exist. It should be likewise recognized that many of these existing facilities are not being utilized to their fullest capacity. Therefore, the association would like to recommend that, before Federal funds are made available to any area for the addition of or the construction of new rehabilitation facilities, steps be taken to insure the fullest use of existing facilities and a request for Federal funds intended for new facilities be fully justified and substantiated.

The Connecticut Rehabilitation Association is also concerned with shortages in the area of trained personnel. It is felt that excellent progress is being made in terms of meeting the needs where rehabilitation counselors are concerned. However, it is now evident that other disciplines are becoming more involved in the process of rehabilitation and the association feels that some provisions should be made for assistance to prospective medical social workers, psychiatric social workers, psychologists, and other professional workers who are willing and

anxious to devote their efforts in the field of rehabilitation.

On behalf of the association, I would like to thank the committee for the oppor-

tunity of presenting the viewpoints of the organization.

Mr. Elliott. Has Mr. Oscar Weiner come in yet?

I notice that Mr. Stanley Myers is here. He is scheduled to testify in behalf of the Parents and Friends of the Mentally Retarded Children of Bridgeport, Conn.

Mr. Myers, will you come around and give us the benefit of your

testimony?

We are very happy to have you, sir.

STATEMENT OF STANLEY MYERS, ON BEHALF OF PARENTS AND FRIENDS OF MENTALLY RETARDED CHILDREN, BRIDGEPORT, CONN.

Mr. Myers. It is a pleasure to be here, sir.

Honorable Chairman, ladies and gentlemen, members of the committee, in 1956 a station wagon stopped at the house of a 24-year-old girl. There is nothing different about this normally; this happens every day in our lives where handsome young men stop at 24-year-old girls' homes and take them out dancing, dining, and to the movies.

Unfortunately, in this case we have a little different situation. This 24-year-old girl was being taken out for the first time in her life by another man. She had never been out of the house before in the company of anyone else other than her mother or her father, or probably

both.

She could not walk. She could not talk. She could not go to the bathroom by herself. She could not feed herself.

But for the first time in her life she was leaving a home to go to

I must put the school in quotes. This girl was picked up by a driver and carried to a station wagon and placed in that station wagon and taken to a center in Bridgeport and cared for there for a period of a short 31/2 hours.

For the first time in 24 years this girl smiled at someone alse. For the first time in the family's life they had an opportunity to go out together without worrying whether the child was adequately cared for. I cannot measure this in terms of money or in terms of material benefits to anyone. I can only measure it in terms of what it means to a family to have hope and something for a child who is presently remaining at home.

Now, granted you can say, "Why should not this adult be placed

in an institution?"

We don't have the right to make that decision. This remains with the parent to make this decision. But at the same time, even if this 24-year-old girl was to be institutionalized in our State alone because she is mentally retarded, there would be a 3- to 5-year waiting period.

During that period must we deny this individual an opportunity

to progress?

When I am asked why you keep bringing this child in, why don't you force these parents into institutionalizing this child, I can only give one answer: "She smiles," and for this reason every penny that

is spent on this child is worth it.

The same thing applies to a 7-year-old or a 9-year-old who is inadmissible to public school training because they are mentally retarded. There is a bill presently before the Congress and I probably am getting off the point here, but a parent in Norwork comes to me and says, "I came to this country from Hungary, out of Austria. All my family was admitted to this country except my 13-year-old mongoloid boy who cannot come because he is mentally retarded."

This has been the history of the problem of the retarded for practically forever. The problem now faces us, I think, and we as society

must face this problem and examine our own conscience.

Toward this end the Parents and Friends of Mentally Retarded Children of Bridgeport, a parent-sponsored organization, has endeavored to create services for the retarded children and adults in the community, where the problem, we feel, must be met in the eventual final analysis.

Toward this end we feel that the Federal Government can stimulate the local organizations, the State organizations, who can benefit these individuals, can stimulate them in helping to meet the needs of these individuals. To this end we feel that a number of things could

be done.

No. 1, we feel that there is to our knewledge no specialist in the field of mental retardation on a national level. The Office of Vocational Rehabilitation, which takes a great interest in this problem, does not have anyone specifically delegated to the problem of the retarded.

The States do not have anyone specifically delegated to the problem of the retarded. Direct grants to workshops have been provided. We feel they should be extended on teaching grants which should be granted for purposes of providing services we feel are needed of the specialists in vocational placement for retarded should be provided.

In the Office of Vocational Rehabilitation in the U.S. Employment Service areas; added services in vocational rehabilitation in State

training schools should be provided.

Through the Federal Government we feel that the vocational educational of the retarded should be investigated and expanded in the direct grants to State trade schools,

School work programs are being investigated now where adults go to school for a 3-hour period and work for a 3-hour period. These

should be further investigated.

Grants for subtrainable adults in sheltered workshops: We know what they cannot do generally. We are not so sure as to what they

can do. This, we feel we must find out.

In the area of special education, preparation of teachers for subtrainable children, children who have been diagnosed as mentally retarded by one individual or perhaps by other individuals, and perhaps there is a misdiagnosis—perhaps we should look into this more closely so that the subtrainable, as he is so classified, is not stigmatized for the rest of his life as a subtrainer without opportunity to improve the capacity that he presently has.

Research into some more effective teaching of teachers; speech training for retarded: At present it is most difficult to get speech education for mentally retarded children presently participating in

public school programs.

Grants for competent clinical psychologist and social workers in public school systems, with medical consultants available all for the

purpose of differential diagnosis.

The possibility of reimbursement grants for recreational programs for school-age children. Staff personnel in the Federal Government in education for correlation and standardization of days and curriculum for training.

Grants to personnel in State offices of education to work more ·

closely with local boards of education.

There are many problems that exist in this field and many areas which we can investigate for purposes of benefitting a tremendous segment of the population which formerly has had little concern expressed over the needs and the desires of these individuals.

I appreciate being here. Thank you for the opportunity.

Mr. Elliott. Thank you, Mr. Myers.

Mr. Giaimo. Mr. Myers, is part of this difficulty in the field of mental retardation in our State the fact that we have waiting lists in our training schools and so forth, the fact that there is not a suffi-

cient amount of public awareness or concern?

Mr. Myers. As you probably know, the last Legislature of the State of Connecticut has recognized the problem and passed a series of bills which we trust will make the public more aware of the problem, as well as provide services to the retarded, and we feel on a community level. Although there is a waiting list of 3 to 5 years in the State training schools, I am of the personal opinion would never be able to build the State schools to house the potential number.

As an example, last year the number of live births in the Greater New Haven area—Bridgeport, Derby, Milford—there were 15,000 live births. If we estimate conservatively 1 percent of the population being mentally retarded, that gives you an indication of just the number we must care for as of last year. Compounding that with this year's births, this gives you an idea of the potential we must recognize.

Mr. Giaimo. The difficulty I see in this whole field of mental retardation is that there seems to be a shortage of facilities, funds, and training personnel; is that not true?

Mr. Myers. Yes.

Mr. Giaimo. Is that not the reason for this primarily, the fact that until there is sufficient public recognition of this problem so that then the States and local governments and perhaps the Federal Government will become aware of it, until such time it is very questionable whether we are going to get the trained personnel and facilities?

we are going to get the trained personnel and facilities?

Mr. Myers. This is ture, but we feel there is another problem involved, too. We must not only get the public aware of the problem, we must get the parent aware of the problem, the professional

aware of the problem.

We have heard for a number of years that we do not have sufficient teachers in the field of mental retardation. We also do not have

sufficient classes in the field of mental retardation.

This is a vicious circle which will never end. If you don't have the classroom you will never find the teacher. If you don't have the teacher you will never get the classroom.

It is true, we need a great deal more public awareness of the problem. At the same time, unless the start is made, we can never make

the public aware of what the need is.

If I may extend this just one moment, I personally feel that if we are in a position to start small, which has happened in the State of Connecticut, we then can build from that point. But if we are not in a position to start at all, it is a question as to whether we will ever start.

Mr. Giaimo. One of the questions that will be thrown at this committee in Congress at such time any recommendation will be made to furnish assistance to mental retardation, one of the first questions will be thrown at us as to why do not the States do more about it?

What is the answer to that?

Mr. Myers. Let me put it this way: I will put it on a local level. You gentlemen were kind enough to visit a center yesterday that started on a local level without one penny's aid from the Federal Government, or from the State government. It was all done through community awareness of the problem, community support of the problem.

If we can present the problem to the community in such a way as to inform them of the need, if we can eventually find a number of children whom we suspect are mentally retarded, the State of Connecticut conducted an investigation in 1957 where they estimate that there are approximately 40,000 known mentally retarded children and adults in the State of Connecticut alone. It is projected to about 2 percent of the population.

These are known figures. So the problem has to be brought out

into the open, No. 1.

No. 2, once it is brought out in the open, if we don't meet it at that level, then we are back to where we started from.

Mr. GIAIMO. Thank you.

Mr. Daniels. Mr. Myers, what do you estimate the mentally

retarded population of the United States to be?

Mr. MYERS. The national statistics claim 3 percent of the population is mentally retarded. Our own feeling is that if this is true,

549

roughly 2 percent of the population is retarded, who will need some assistance in supervision as far as living in a community is concerned.

One percent is that borderline level that perhaps we will never get to see. They get jobs and adjust to the community and move in the

regular society.

Mr. Daniels. As I have been listening to the witnesses that have been testifying here, we have a pretty sick Nation, 10 million disabled housewives, 8 million speech and hearing defectives, 1½ million epileptics.

You just gave me a figure of 5 million mentally retarded. This is

only part of the field.

Mr. Myers. It is a matter of degree, if I may say so, Congressman. No. 1, the individuals about whom you are speaking are individuals who perhaps can be cured or who perhaps can subsist on a

normal level.

We are talking about a segment of the population who will never We have so little research in the area to find the reasons. Presently today we know approximately 77 different reasons for mental retardation. I can quote you four which have been investigated recently that we think we can control.

We don't know yet, because it is so recent we don't have enough

proof to say it can be controlled.

So the area of research has to be looked into more fully.

Mr. Daniels. With such an alarming number of people who are ailing in one manner or form or another, do you think there would be a greater awareness of the problem nationally and that something would have been done about it prior to this date—

Mr. Myers. I would think so, but I have never been able to figure

out why it has not happened.

Mr. DANIELS. Fortunately, our committee under the chairmanship of Mr. Elliott, is endeavoring to do something about it. Mr. Myers. Thank you.

Mr. Elliott. Thank you very much, Mr. Myers.

Now, has Mr. Weiner arrived yet?

Mr. Weiner, we have restricted our witness today to 10 minutes. If you have a longer statement than that and you want to summarize it, I am happy to say to you that the complete statement will be made a part of the record.

You may proceed, in view of that limitation, in any manner you

care to.

STATEMENT OF OSCAR D. WEINER, EXECUTIVE DIRECTOR, CHILDREN'S CENTER, HAMDEN, CONN.

Mr. Weiner. I am representing here the Children's Center which

is a private association located in Hamden.

I would like to speak from the point of view of opportunities through the rehabilitation acts that might be considered by the Federal Congress to augment the treatment and study of emotionally disturbed children who are residents at our institutions.

These children have not been able to meet the demands of living as a member of the family. We feel that at our agency we have the ability and the potential to structure treatment and to give appropriate services to these children except in the area of schooling which

has become increasingly difficult.

There are now 72 children in residence. Some of these may benefit by keeping their ties with the community, by attending public schools in New Haven.

However, it has been found by both the school faculty and by our staff that many of these children need special classroom services, preferably located at the institution where they can be more individually supervised by our teachers in small groups.

The incidence of school maladjustment as a major reason for referrals to our institution is increasing at an alarming rate.

Whereas 2 years ago about one-third of our referrals were children who had repeated major difficulties in public schools, now almost three-quarters of our

referrals emphasize this.

These children come to us after moving from one temporary home to another and from school to school, having had little opportunity to develop trusting relationships, confidence, incentive or skills so that they might achieve some learning.

Out of our 72 children we have 18 in 2 special classrooms at our institution. Both we and the very cooperative local public school people feel that this simple environment for a temporary period is absolutely necessary during the treatment of these children before they go into the more complex public school system and especially in the secondary schools where they must go from classroom to classroom, from teacher to teacher, without the benefit of constant and consistent supervision.

There are, in addition, 16 of our children who at this moment desperately

need special classroom help.

We and the public school authorities feel it is a pity that these children and many on our waiting list, cannot be provided with this special service.

It seems too vast a problem for the local board of education to handle.

However, it would appear to be of such benefit for agencies such as ours who have made a tremendous investigation, to meet these emotional problems to be able to complete our job by assistance in building up school facilities to meet the increasing educational and vocational problems referred to us.

We have evidence that the children who have been in these two specialized classrooms have profited from this experience. They have adapted to special classroom routines where they have been constantly observed and could not be

tempted to leave.

We have had boys who have openly defied and threatened to assault the various public school teachers who now have a chance to know one teacher and

through that relationship to develop trust.

Our two teachers have felt that in small classrooms they have been able to ferret out interests and talents in pretty inadequate students which the public schools do not have the time to do.

These children have gained enough confidence to try a little in other areas

where they have previously felt inadequate.

We have countless children in these classrooms who were at one point incapable of staying in public schools, but later were able to return to public schools and adjust.

Our children have had severe emotional problems and poor educational background and incentive before they came to us. Although we wholeheartedly endorse high standard vocational schools and services with the broad scope of academic as well as practical courses, we find also a very urgent unmet need for supplementary vocational services for those children who have been handicapped, but must go out in the community after 16 years of age and earn a living.

We would, therefore, like to see funds for vocational training pro-

vided for treatment institutions.

We endorse the development of independent living workshops or rehabilitation services for handicapped persons over 16 years of age, referred to in bills 1119 and 3465.

We would also hope that residential facilities may be considered as important for these youngsters so that they might serve those gains which they might receive from these rehabilitative services through a situation which is both supportive and strengthening to them.

Our urgent question is not the growing need of special vocational and educational services for emotionally handicapped children so vast that it is beyond the resources of the local board of education and perhaps beyond the State capacity to finance unless Federal assistance is available, perhaps through a matching formula, that encourages State and local communities to take initial steps with at least token investment of their funds.

In summary, we give testimony to the need for additional special classrooms for the emotionally handicapped to the end that study and treatment services be rounded out with proper treatment, geared in education.

Two, we give testimony to the need for vocational schools geared to the practical goal of preparing children with lesser academic competence to learn a trade which will enable them to become selfsupporting.

Three, we endorse independent living facilities for the handicapped with the suggestion that supportive group residences be provided in order to preserve the gains of these rehabilitative services.

Thank you very much.

Mr. Elliott. Thank you very much. Mr. Giaimo. May I ask one question?

Mr. Elliott. Mr. Giaimo.

Mr. Giaimo. Is your school supported by public or private funds?

Mr. Weiner. It is a private agency.

Mr. Giaimo. It gets no support from the State at all, does it?

Mr. Weiner. The support it gets from the State is through partial payment for board. In no case does any parent or State government through the State welfare department pay the full cost of care.

Mr. Giaimo. Thank you.

Mr. Elliott. Thank you, Mr. Weiner.

If none of our afternoon witnesses are here, we will adjourn until 1:30.

May I ask those of you who are here to cooperate with us in passing the word around to any possible witnesses that we are trying to finish by 4 o'clock this afternoon.

We have witnesses scheduled through 4:50, but if we can get word to those that we are speeding up our schedule a little bit, I

think they will cooperate with us.

(Thereupon, at 12:10 p.m., the subcommittee was recessed, to reconvene at 1:30 p.m., same day.)

AFTERNOON SESSION

The subcommittee reconvened at 1:30 p.m., upon the expiration of the recess.

Mr. Elliott. The subcommittee will be in order.

Somebody said that a "North wind doth blow and we shall have snow" and I am hoping that you will pardon me if I tell you I have in mind to seek the sunnier climes beginning about 4 o'clock.

First, I am going to recognize the Honorable Anthony C. Gelor-

mino, mayor of Torrington, Conn.

Mr. Gelormino, will you come around.

He tells me he can make his statement very short and he needs to be somewhere else very badly and we will recognize him at this time.

STATEMENT OF HON. ANTHONY C. GELORMINO, MAYOR OF THE CITY OF TORRINGTON, CONN.

Mayor Gelormino. Thank you, Mr. Chairman.

Mr. Chairman, members of your committee, I would just like to go on record as being in favor of your legislative bills to help the

handicapped and unfortunate people of the country.

I would like to tell you just a little about Torrington. About a year and a half ago I appointed a committee on rehabilitation and aid to the handicapped. This committee consists of prime members of individual agencies, including State unemployment, our welfare department, directorate of health, and the various agencies which are doing their very best to aid the handicapped.

Also in the city of Torrington I do have a little bit of school, we call it a school, to help the exceptional children. They are primarily

mentally retarded children and also various handicaps.

We are going to place another teacher on that who is being specially

trained to conduct the courses in the school.

To date my committee on aid to the handicapped and rehabilitation is working very closely with the State rehabilitation centers. We have found in a survey recently that we have about 90 people

that are in dire need of such type services.

We also find that with the knowledge of the residents of our area that such a committee does exist, that many people are coming out of obscurity and people who have been tucked away in homes for many, many years are coming out and registering with the hopes that they may be able to be helped.

I am very happy to report that we have made some progress. We are doing everything we possibly can to help these unfortunate people.

I was rather amused and amazed this morning when one of your colleagues questioned one of the people here who gave testimony, that we have a real unhealthy country with the multiples of people who are afflicted.

I do feel that what you are attempting to do will certainly eliminate

a lot of that because there is certainly a lot of overlap.

Many of the different agencies have the same people on their records. I think there is mass duplication. That is the reason for my committee. We are a city with a population of just over 30,000 people. To date we have about half of 1 percent.

We are an industrial city. In addition to trying to rehabilitate and to aid these people, I have members of the committee, members of management and labor and chambers of commerce, so that we are also able after due evaluation and all the aid that can possibly be

given to make an attempt to find the handicapped person

employment.

I sincerely urge the Congress of the United States to give favorable consideration to enactment of the proper type of legislation which will assist the communities and the towns and the States and the entire country.

We do need assistance. As yet we have not used tax dollars. If there is need for it I intend to budgetize a minimum amount and work from there, but I want to sincerely urge you to do everything you possibly can to get the proper legislation passed which will enable these unfortunate people to smile again and to live with dignity and independence and certainly to assist the domestic problems in their families so that they will not carry the cross alone.

My sincere thanks to all of you for the pleasure of being here and also my own personal congratulations to Congressman Giaimo for his effort to bring the committee here. I hope you will get enough evidence and information here to indicate that there is a dire need for

that type of legislation.

Thank you, sir.

Mr. Elliott. Thank you very much, Mayor Gelormino.

Now, Dr. Pasquale Confreda.

Dr. Confreda, we must limit you to not more than 10 minutes.

STATEMENT OF PASQUALE CONFREDA, PRESIDENT, PARENTS LEAGUE, RHODE ISLAND SCHOOL FOR DEAF, PROVIDENCE, R.I.

Mr. Confreda. Thank you for reminding me, but I think I can

speed up the time. I have about 3 minutes.

Mr. Chairman, members of the committee, as president of the Parents League of Rhode Island School for the Deaf, and father of six children, two of whom are deaf, I wish to approve the recommendations made to the committee.

I wish to commend highly the work of Senator Lister Hill in introducing into the Senate Joint Resolution 127 and Representative John E. Fogerty for his work on companion bill 488 introduced in the House, and to the others who have worked for this important cause.

The teachers that I have known who have taught are dedicated to their work and it is miraculous the result they obtain under such

difficult odds.

I am in favor of any grants-in-aid program to encourage more teachers to become speech and hearing therapists. The children in our country who are handicapped by deafness need the skill of specially trained teachers of the deaf to develop their ability.

We also need specially trained speech pathologists and audiologists

to help those with speech and hearing impairment.

I endorse on behalf of myself and the Parents League of Rhode Island School for the Deaf, which I am representing, anything which may further this goal.

Thank you for the invitation to appear and speak to you.

Mr. Elliott. Thank you very much, Dr. Confreda.

Is Mr. Victor Reis here?

Mr. Victor Reis is the chairman of the Rehabilitation Commission of Torrington, Conn.

Will you come forward, sir. You may proceed.

STATEMENT OF VICTOR REIS, CHAIRMAN, REHABILITATION COMMISSION OF TORRINGTON, CONN.

Mr. Reis. Thank you, Mr. Chairman.

I merely wish to state briefly that I would like to concur in the statement made by Mayor Gelormino so far as the city of Torrington

is concerned. He covered it very, very adequately.

I just want to add that there is definitely a need for special rehabilitation and education here in the State of Connecticut. I not only speak personally of my own personal experience. For 11 years I conducted the program for the Veterans' Administration concerning prosthetic and sensory aids. I am very well acquainted with the dire needs that are presently quite obvious.

And not to take up too much of your time, as Mayor Gelormino indicated, we in the city of Torrington are definitely making an attempt to do our share for the purpose of rehabilitating these individuals that are in dire need of this particular type of training.

I at least hope that when you do return to Washington that a special effort will be made to enact the proper type of legislation which the entire country will be very proud of.

Thank you.

Mr. Elliott. Thank you very much, Mr. Reis.

Our next witness is Mrs. Douglas T. Wilson, president of the Rhode Island Congress of Parents and Teachers.

Mrs. Wilson, you have heard me speaking of the time limitations,

have you not.

Mrs. Wilson. I promise to abide by the rule.

STATEMENT OF MRS. DOUGLAS T. WILSON, PRESIDENT, RHODE ISLAND CONGRESS OF PARENTS AND TEACHERS

Mrs. Wilson, I am Mrs. Douglas T. Wilson, president of the

Rhode Island Congress of Parents and Teachers.

We welcome this opportunity to speak of some of the unmet needs in Rhode Island in the field of special education. The division of the State department of education that deals with special education is working constantly to improve these services in the public schools. However, throughout the work with the mentally and physically handicapped, and the gifted, there emerges a pattern of similar needs.

It is this pattern of unmet needs which the Rhode Island congress

wishes to bring to the attention of the subcommittee.

1. All teachers should be trained to recognize problems: For any child to receive the benefits of existing special education programs it is necessary that his individual needs be recognized. The classroom teacher if trained to spot symptoms of trouble, is the logical person to set the wheels in motion to secure for the child the help he needs.

This applies to poor eyesight, poor hearing, and emotional disturbances. All of these difficulties are much more successfully treated if

detected early. The child's education may proceed and he remains

a happy member of the community.

2. More teachers are needed in special education: Many more teachers are needed in all fields of special education. More teachers of the mentally retarded are needed. Some communities are having difficulty complying with the State law requiring instruction of the educable and trainable, because of the problem of transporting these children. If more teachers were available these communities might have smaller neighborhood classes nearer the homes of these children. Likewise more teachers are needed for children with partial vision.

There is need for more speech therapists in Rhode Island. It is estimated that the three thousand pupils assisted by speech therapy in the past year are only about half of those who need it, and there are undoubtedly many more whose need has not been recognized.

This past year about 14 school districts in Rhode Island have had some form of special program for gifted children. These communities are now beginning to feel the need for more teachers specially

trained in this field.

3. Early evaluation, treatment, and follow-up of problems: In most Rhode Island communities a social worker is called to go to the home only when a problem interferes with attendance in school or disrupts a class. By that time the problem is far advanced.

Along with the need for teachers who are trained to recognize problems some program is needed to work with the home, to help parents understand and be impressed with the need for early

treatment.

This points out a need for more school social workers. The role of such personnel in helping the child, the teachers, and his parents to understand his difficulty and to bring about changes necessary to correct the situation, should have more emphasis. The social worker's skill and experience can be valuable in assuring early treatment.

In the case of emotionally disturbed children, there is a need for follow-up care if the benefits derived from existing clinics are to be

permanent.

The clinic staff is unable to follow these children into the home and the community. Lack of funds to provide sufficient resources for getting and keeping these children under effective care creates additional problems for the school and the community. House Joint Resolution 488, training teachers of the deaf, and pathologists and audiologists.

Policy No. 4 of the legislation program of the National Congress of

Parents and Teachers states, in part:

Federal funds appropriated for education should be available for special programs for the education of handicapped children.

The Rhode Island Congress of Parents and Teachers favors the passage of House Joint Resolution No. 488.

There are at present 23 speech and hearing therapists working in the public schools in Rhode Island. It is estimated that a minimum

of 50 additional ones are needed.

There are at present no facilities in Rhode Island for training speech pathologists and audiologists. While it might be desirable to establish such a training center in Rhode Island, we are aware that large expenditures for an extensive faculty and teaching equipment would be required.

If facilities in nearby States are not being used to capacity, our needs may be filled by encouraging enrollment of more Rhode Island

residents in these centers.

If this bill passes, it is hoped that the existence of the fellowships that will be established will be widely publicized so that Rhode Island residents might hear of them and apply. Regarding H.R. 1119 and 3465, The Rhode Island Congress of Parents and Teachers favors H.R. 1119, independent living. In so doing, we are furthering the action program of the National Congress of Parents and Teachers which is concerned with the prevention.

In this case it is the prevention of institutional care for those handicapped persons who may be restored to independent living.

The Rhode Island congress favors the provision of this bill which removes the restriction that a person must be progressing to employability before the vocational rehabilitation program can be applied.

Progress of an individual as far as becoming self-sufficient at home and thus able to stay out of an institution is in itself desirable. And

this is economically sound.

In Rhode Island we are in the midst of a \$10 million expansion program at the Ladd School for retarded children. It is estimated that unless we can help the adult mentally and physically handicapped to independence we will be faced with the expenditure of another \$20 to \$30 million for institutions for their care.

Further, it may well be that the workshop plan as a preemployment experience will assist many more handicapped persons to progress to

employability than at present.

Thank you again for this invitation to present our views here.

Mr. Elliott. Thank you very much, Mrs. Wilson for a very fine statement.

Is Dr. Josephine Rathbone here.

Miss Rathbone. Yes, sir.

Mr. Elliott. Dr. Rathbone, is formerly director of recreation in rehabilitation, Teachers College, Columbia University.

You may proceed.

STATEMENT OF JOSEPHINE RATHBONE, FORMERLY DIRECTOR OF RECREATION IN REHABILITATION, TEACHERS COLLEGE, COLUM-BIA UNIVERSITY

Dr. RATHBONE. Gentlemen, today it is my great pleasure to present the Consulting Service on Recreation for the Ill and the Handicapped

of the National Recreation Association.

We are not here to quarrel with any concept enunciated in bill H.R. 3465, except possibly the implication that grants shall be forthcoming only when assurance has been given that the facility or program is "feasible and necessary for vocational rehabilitation"—page 6, section 203(a)(1) and page 17, line 20, even outside the competitive labor market, page 15, line 17.

We see independent living as meaning something different from vocational self-sufficiency, for many severely handicapped and older

persons, page 2, lines 3 and 4.

We see at least the last three of the "four Fs," food, family, friendship, and freedom, for handicapped individuals as for you and me, depending on much more than economic or vocational sufficiency.

We believe that the social sufficiency of the individual is of prime

importance in our democratic society.

If Mrs. Beatrice H. Hill, the director of the Consulting Service on Recreation for the III and the Handicapped, of the National Recreation Association, were here, she would stress the need, among the chronically ill, and handicapped, for social communication and food for the mind as well as the body.

I share with her, of course, a realization that, however, vocational self-sufficiency is to be one of the aims of all of us committed to expanding and improving what Dr. Howard Rusk first called "the third

phase of medicine, rehabilitation."

Mrs. Hill might tell you the story of Jimmy Seaborn. The year is 1949. The boy, Jimmy, is 18 years old. The diagnosis is rheumatoid arthritis, affecting the entire spine, the vocational rehabilitation is rating zero. The rehabilitation team can do nothing more for him.

He is to spend his life in a chronic hospital.

Today, 10 years later, Jimmy, unable to either walk or sit, limited in movement to a slow motion shuffle on crutches, or free movement on a self-propelled stretcher, is a full time recreation leader at the prevailing wage scale in the St. Joseph's Home for the Aged in Peoria, III., 1,000 miles from the hospital which for so many years was his home.

How did this come to be? A miracle, perhaps? No. The answer to Jimmy Seaborn and his triumph over a crippling handicap was

motivation through social rehabilitation.

In short, developing in him a driving need to function to the fullest degree possible within the limitations of his handicap, and

the knowledge and skills necessary to satisfy the need.

Ten years ago Jimmy, on the verge of melancholia, with little or no contact with people beyond his own ward, was discovered by the recreation therapist of the hospital. The first step in the development of James Seaborn, recreation leader, was taken when he was persuaded to join the patients' glee club. In a short while he was the glee club director. Then reporter on the patients' newspaper. In time, its editor.

So it went over the years with constant encouragement, motivation education in recreation theory and skills, and participation in dramatics, arts and crafts, the hospital's intercom radio station, in short; all the activities which make up a well-rounded program of recreational activities for the chronically ill and handicapped, as well

as for you and me.

Today this boy, who cannot sit in a chair, who can only move with the greatest difficulty, directs a complete recreation program in a home for the aged, recruits and trains volunteer aides, and motivates the aged patients of the home toward the social communication which is necessary if the home is to be a community in the true sense of the word, and not just a place in which to wait for death.

This is an example of the values of recreational therapy, as a tool in helping to motivate the seriously handicapped to the point where

whatever potential is left is susceptible of vocational rehabilitation or independence.

We in the recreation profession want to question, not what can be done in the rehabilitation of the chronically ill and handicapped, but what is not being done for them, especially here in New England.

We, representing the National Recreation Association, must point out that we are not qualified to present problems in special education out that we are not qualified to present problems in special education, but we do know the Jimmy Seaborns of the United States and make a plea for their needs for socialization and activities which lend to psychophysical rehabilitation.

This all has a flavor thoroughly congenial to special education. I must assure you, also, that many of the registered recreation personnel providing recreation for ill and handicapped in this Nation are college graduates in education, and members of the AAHPER,

a division of this National Education Association.

It would be useless, here in New England, for me to go before any State or municipal body and any hospital board or any council of social agencies, requesting funds for an expansion of their rehabilitation services, if I carried with me only statistics about the number of hospitals in the Nation that do or do not have professionally directed programs of recreation, or the number of proprietary nursing homes for the aged without adequate programs of socializing activities for those likly to become or to remain vocationally self-sufficient or the paucity of playgrounds that can safely service hand-capped children.

I would be asked to make a survey locally. This is what will support local fund raising in New England. Fortunately, such a

procedure is envisioned in section 205(a) (1) of HR 3465.

I feel sure that the States of New England can be expected to abide by the Federal-State regulations as to financing laid down in the bill under consideration.

There are some strikingly good progress of total rehabilitation in New England to inspire extended local efforts, I draw to your attention:

The Institute for living, in Hartford;

Crotched Mountain Rehabilitation Center in New Hampshire;

The Liberty Mutual Insurance Co.'s program initiated in Boston, to say nothing of fine programs in individual hospitals in that area, and research within the Department of Medicine at the University

of Vermont in Burlington.

I am not purposely leaving out Maine, where such excellent total care for children with orthopedic limitations was in operation 40 years ago in Portland. Or the special research in Providence, R.I., regarding allergic reactions in relation to psychological stress, to be conquered with the help of relaxing techniques.

We must not forget, either, the excellent departments of special services and of physical medicine rehabilitation in the VA hospitals

of this district.

But the programs, with the exception of the VA, have all been independent efforts of physicians and other interested parties, struggling for funds with which to serve a very few individuals.

They have known how important is independent living for the individual and for the society of which he has to be a part. They give the kind of demonstrations needed in New England to inspire total rehabilitation.

Since I have been here the past few days, these doctors and others have known how important it is. This would mean activity centers, consultation centers for the homebound, proper services in the nursing homes, homes for the aged, and other agencies where the program today means nothing more than nursing care in bed.

But where are the funds within this bill?

What we need, in the profession and the agency I represent today, is funds for scholarships and training grants, and to make demonstrations and to disseminate information as to the studies and investigations, which have already been conducted to help the many Jimmy Seabornes become independent, psychologically if not completely physically.

Bill H.R. 3465 can make all this possible. We want to provide more and better programs, with better trained personnel, for the purposes of cultivating and sustaining morale, of providing enjoyable and enriching experiences and increasing each handicapped

individual's opportunities for social expression.

Without social communication, the end result of recreational therapy, there can be no independent living.

Thank you.

Mr. ELLIOTT. Thank you very, very much, Dr. Rathbone. You have really challenged our thinking in this field and we appreciate it. Is Michael F. Walsh, commissioner of education of the Rhode Island Department of Education, here?

Mr. Walsh, because of many factors we have had to impose a rather

strict time limitation this afternoon of 10 minutes.

You may proceed, sir.

STATEMENT OF MICHAEL F. WALSH, COMMISSIONER OF EDUCA-TION, RHODE ISLAND DEPARTMENT OF EDUCATION

Mr. Walsh. Mr. Chairman, members of the committee, as commissioner of education of the State of Rhode Island, first of all I would like to express my deep appreciation for the invitation to be here to express our views, and commend you, Mr. Chairman, and your committee, for the excellent work you are doing in this particular field of rehabilitation of the handicapped child as well as for all educational purposes.

We from Rhode Island actually are pro-Fogarty—

Mr. Elliott. I am pro-Fogarty, too.

Mr. Giaimo. I am, too, for the record.

Mr. Walsh. What we are particularly concerned about is the interest you have expressed in your committee for the welfare of our

young people as well as our adults.

We wholeheartedly subscribe and support these bills that pertain to the paying of teachers for speech and hearing as well as broadening the base of rehabilitation so that we can incorporate those people who up to now have been disenfranchised, we might say, from developing the qualities they might have developed had the opportunity been presented to them.

We believe that the operation must be broadened and the Federal Government must take a stronger part in financing programs in

cooperation with the States.

It should be a cooperative movement and shared with the States and the Federal Government in order that no young person in this country, no American citizen is denied an opportunity to grow to the full extent of his mental, social, and physical ability.

An act of God is an act of God. The only thing we can do is to live with it and by the grace of God make the adjustments as we see

the adjustments to be made among our fellow men.

I believe that the Federal Government will have to do something to impress upon the minds of future colleges and divisions of colleges and education that every teacher who is prepared to go out in the field of teaching should know all the handicaps that a child possesses.

In my humble opinion I am convinced that the more we know about the handicapped and what their problems are, the better are

we able, ourselves, to teach the normal child.

The more that we bring up children in the atmosphere of normalcy the better the child is and the emotional disturbances at home are

reduced to a minimum.

Furthermore, about 80 percent of the children who are handicapped could be taken care of in normal classrooms provided the teachers had been given proper training in their undergraduate years and given an opportunity for graduate work and then, which is vitally important, and I am quite sure it must be in the mind of your committee, that assistance be given to these teachers when they are in the classroom, psychological testing, medical assistance, and social assistance, for the simple reason that one never begins to realize how well a blind person can take care of himself or herself until one has lived with a blind person and seen what a blind person can do.

The same with the retarded. If we are to educate the American people to the importance of this field of the handicapped we have to bring in the normal people every day living with the handicapped to realize what the handicaps are and to see how well they can take

care of themselves in spite of handicaps.

Now, I think that in providing the teachers with these skills and opportunities and clinics, that we can take care of a great many of these young people in our normal classroom work.

Mr. Chairman, I would strongly advocate two very important

factors as I see it that are unmet:

The need for every prospective teacher of a class in the handicapped, the emotional, medical, and physical and to make provisions that when these teachers are out in the classrooms that they get the professional assistance needed to help them to be able to direct and guide these youngsters who sit before them.

This means early identification of all our children. And this early identification of their problems must be kept record of and led into this matter of rehabilitation because there is no distinction between rehabilitation and what we are talking about in the handicapped

child.

That rehabilitation must get down deep in the life of the child and begin to have a record made of these conditions and a file kept so that when the child approaches 14 years of age there should be a complete record, and rehabilitation counselors should be working in the high schools and schools to help direct the work of these youngsters in the anticipation of picking them up someday.

For that reason we believe that early identification of problems is necessary, that guidance and counseling must be provided in these services for our teachers and materials and professional employers.

Then we can pick up those who are able to go to work and can help those who are unable to work because I think, as one speaker has previously said, we owe some consideration to these people who are homebound and whose mind can become affected if we do not do something to keep their time occupied.

I would ask you, Mr. Chairman, also, to give serious consideration to the possible use of television in developing a stronger and broader program in the field of rehabilitation, particularly for our adult people, because I think those who are homebound, if a sound program can be developed, they can be greatly helped through the utilization of good TV programs.

Mr. Chairman, I am deeply grateful to you for the time you have allowed me. I trust that you will continue your energy to present these bills to Congress and see that they are properly enacted because I think you are making a tremendous contribution to the morale of

these bills to Congress and see that they are properly enacted because I think you are making a tremendous contribution to the morale of our country and I know of no time, Mr. Chairman, when the morale of this country needs to be bolstered up so much as it is right now.

Thank you.

Mr. Elliot. Mr. Giaimo.

Mr. Giaimo. I am very interested in the comments you just made about the possible use of the TV in homebound rehabilitation.

Do you have in your department any information on projected courses on that that you could send to us?

Mr. Walsh. No, sir; all we have is a fairly good visual-aids department.

Mr. Giaimo. I was interested in TV. I think you have hit upon something.

Mr. Walsh. We do not.

If I may have just a moment to tell you, we did make application a couple of years ago for the utilization of TV, but it was for the mentally retarded. We thought we might be able to take a class of mentally retarded and film them, you see, and then utilize that for discussion periods because we feel that something has to be done to get the parents of these mentally retarded children in a place where they can go to these diagnostic centers and have their frustrations eliminated. That goes back to the early identification of the child.

Mr. Giaimo. If you have any information and send it to us, we

will appreciate it.

Mr. Walsh. Thank you.

Mr. Elliott. Thank you, Mr. Walsh.

Dr. William A. Fraenkel, consultant to National Association for Retarded Children, Committee on Vocational Rehabilitation, and Sheltered Workshops.

Dr. Fraenkel, we are happy to have you. You understand the time limitation.

STATEMENT OF WILLIAM A. FRAENKEL, CONSULTANT TO NA-TIONAL ASSOCIATION FOR RETARDED CHILDREN, COMMITTEE ON VOCATIONAL REHABILITATION AND SHELTERED WORK-SHOPS

Dr. Fraenkel. Yes; I do. Mr. Chairman and members of the committee, I am pleased to be here on behalf of the National Association for Retarded Children.

I am happy to submit the evidence you have in front of you now for the record, and with your permission highlight the three charts as the gist of the entire presentation.

Mr. Elliott. Without objection, the statement which Dr. Fraenkel has filed will be made a part of the record.

(The statement referred to follows:)

TESTIMONY OF WILLIAM A. FRAENKEL, PH. D., CONSULTANT ON VOCATIONAL REHABILITATION AND SHELTERED WORKSHOPS NATIONAL ASSOCIATION FOR RE-TARDED CHILDREN, INC.

The National Association for Retarded Children is pleased to offer its support of the Rehabilitation Act of 1959 on behalf of 5 million retarded children and adults in this country. This testimony will present some background information on who we are, the group we represent, and will describe those of our activites germane to the topic. We will point out how this act would enable vital services which are currently unavoidable to be provided for the adult retarded in this country.

WHO IS NARC?

The primary purpose of the National Association for Retarded Children, Inc. is to improve the welfare of retarded persons through counseling for the family; special education and training; vocational training; integration into society; and training personnel. Current research efforts are directed toward prevention.

The National Association for Retarded Children, Inc., known as NARC, is the only national voluntary, parent-inspired association devoted exclusively to an

aggressive, united attack on the problems of mental retardation.

There are 700 affiliated local and State units. Included in this figure are units in Hawaii, Puerto Rico, and in military installations abroad. Generally, NARC broadens public awareness of problems of mental retardation. Specifically, it provides local units with consultation and guidance to improve their services and gain sufficient support.

WHOM DO WE REPRESENT?

There is substantial agreement that about 3 percent of the population, or 5 million children and adults, are mentally retarded to the point of requiring specific services or facilities either throughout their lifetimes or at crucial periods. These services or facilities may involve no more than the provision of special classes in the school system for the upper group of retardates, or permanent nursing or infirmary care for the most severe cases.

In recent years it has been found practicable to divide the total number of

retardates into the dependent, the semidependent and the marginally indepen-

dent groups.
